The Nation.

NEW YORK, THURSDAY, JULY 1, 1909.

The Week.

The corporation-tax amendment to the tariff bill, introduced in the Senate last Friday, is, in outward seeming, a mild-mannered affair. The exemptions allowed are numerous. Losses and depreciation are to be written off before the balance-sheet has to be submitted to the tithing-man. Double taxation is to be partially avoided, since a corporation may deduct any taxes it has paid to any State or Territory—but this does not include municipal taxes on corporations. Nor does there appear to be contemplated, except in unusual cases, anything like inquisitorial methods. The sworn returns of the proper officers of corporations will ordinarily be taken without question, and the tax levied on that basis. These returns are to be public records, open to inspection; but the details of corporate business, or any information gained by collectors in the course of its investigation, shall not be divulged except by "special direction of the President." All this looks—and is meant to look—very harmless. But it is evident that the framers of the tax grew a little timid as they went on. They became afraid of getting too much revenue, as of too much publicity; and also dreaded annoying and offending too many people. The exemption of interest on bonds is difficult to justify, on any other theory. If the corporation tax was taken up mainly because it was expected to be "popular," it is obviously a mistake to exempt bondholders. And all the care taken in drawing the measure will not prevent it, if made law, from provoking a great amount of litigation, to say nothing of trickery and fraud.

We can but hail the glimmerings of common sense shown at last by the Merchant Marine League. At its meeting in Washington last week, which the President attended, the plan was announced of introducing a bill which should provide for a modified form of free ships. That is to say, any foreign-built vessel above 5,000 tons, wholly owned by Americans, is to be admitted to American registry, provided it engages solely in the foreign trade. This is the first time the subsidy-seekers have gone as far as that in the line of rationality. Their great trouble hitherto has been that they did not really want the ships so much as the work of building them. By their burdensome system of taxing and penalizing our industry, they had made the cost of ships turned out from our yards so high that Americans could not buy and sail them in competition with other nations; yet when Americans thought of purchasing steamships made abroad, as do the Germans, they were absolutely forbidden to use their own property under their own flag. If the light has now dawned upon this darkness, it is matter for public congratulation. We are not sanguine about getting free ships without a long and hard struggle. Our protected interests would rather see the American flag banished from the seven seas than allow it to float over plates and engines on which they have not first taken toll. But it is a gain to have the Merchant Marine League finally confess that something besides government boosting must be tried.

The award of the Georgia Railroad Strike Arbitration Board is a gratifying triumph of common sense and common honesty. Seniority of service and not color is the basis recommended for the promotion of firemen; and equal pay for equal work to firemen, hostlers, or hostlers' helpers, employed by the railway, is the award in the matter of wages. How any other result could be arrived at is unthinkable. The South has protested all along that the negro was to be given a fair chance at work, however much his political privileges were to be restricted. The findings of the Arbitration Board substantiate this oft-repeated profession. It is hard to see how the supporters of the innate superiority of the white race could logically defend the proposition that the white has to be protected against the competition of his inferior.

Attorney-General Wickersham's decision to discontinue the government suit against the New Haven and Boston and Maine railways, is certainly good sense and presumably good law. The situation has radically altered since the suit was first brought. Local authorities have largely done what the Federal power was invoked to do. The New Haven's acquisition of trolley-lines has been judicially pronounced illegal, and the company is getting rid of those properties. As for the merger of the two railway systems, there never was fair ground for asserting that their lines, except in a few minor filaments, were parallel and competing. Public sentiment in New England was in favor of the union, chiefly for the purpose of bringing fresh capital and better management to the Boston and Maine. And now the State of Massachusetts has deliberately sanctioned the merger, under carefully-drawn restrictions, reserving to the Legislature close control over the financial operations. Attempts to make this union of railroads precisely like what was undertaken by the Northern Securities Company, are childish. In that case, the lines were indubitably parallel and competing, and there was no semblance of legislative control of the holding company.

The conviction of Sanford Robinson, formerly of counsel for the Heinze copper interests, for corruptly impeding the administration of justice, should serve as a useful deterrent to corporation lawyers generally. Modern tendencies have too much changed the practice of law from a profession to a trade. The professional restraints have given way in many cases to the prostitution of a lawyer's legitimate services to a barter for hire. It is well to remind young attorneys that by virtue of their calling they are all informal officers of the courts of justice. For a lawyer to drive possible witnesses out of the jurisdiction of a tribunal, or to effect a concealment of a client's books of account, is on the same plane as a physician's sale of a certificate of death or his engagement to perform a criminal operation. A sharp conviction or two of this kind will be more effective in keying up the standard of legal ethics than dozens of well-intended commencement addresses to newly-fledged graduates of the law schools. Fear is an excellent school-master.

Burlingame Public Library

The outcome of the election in San Francisco last week shows, as was to have been expected, that the voters of that city were sadly torn by conflicting emotions when they read over the proposition to build and operate a municipal street railway. In favor of the enterprise stood the whole infamous history of the United Railroads. Surely, the thievery and political corruption indulged in by this corporation must have made even extreme municipal socialism appear the lesser of two evils—until the voter contemplated the pack of office-holders, ward bosses, and laborites who would have something to say in the management of a municipal railway. We cannot read into the narrow majority of 403 against the proposal any repudiation of radicalism. San Francisco found herself hung between the devil and the deep sea and concluded, rather timidly, that a two-million-dollar experiment is ill-timed when every man suspects his neighbor. And the zeal with which walking delegates and their newspapers championed the project, definitely sealed the verdict against it.

What is pronounced to be a final effort to set aside the pure food law has been initiated by a number of concerns skulking in the background, which have put forward the Hipolite Egg Company of St. Louis as plaintiff against the Secretary of Agriculture. A seizure made last March of the company's canned eggs in Peoria, Illinois, is cited as proof of the irreparable injury which the company is sustaining without adequate remedy at law. It seems that boric acid is injected into the liquid egg mixture which is sold to bakers and confectioners for use in making cake and pastry. There is a fitting malodorous aroma about the contention of beef-embalmers and egg-fortifiers that they have a constitutional right "to sell the public what the public want." Rousseau in his enumeration of the natural rights of man quite forgot the right to sell skimmed milk for cream.

We may be far too indulgent to our young college barbarian, but we are too often utterly unfair to him. It may be true, for instance, that the average undergraduate learns very little and cares very little for learning; and it may be true that our colleges are nurseries of disbelief and libertinism. But the two things together cannot be true. If our universities were filled with an eager, passionate youth, avid of ideas and ideals, there would be danger in heretical voices from the cathedra. Such a danger the European universities have often experienced. The French collegian has played a prominent part in demonstrations and *émeutes*. The German Burschenschaften have made history. The Russian university student has been a leader of revolution. Given a young man who finds truth in books, and in himself the instinct for translating theory into action, and the colleges may influence the world. But our own healthy football and rowing men are quite immune against noxious doctrine.

The American high school should not be razed merely because its graduates cannot run a department store, or make a pair of trousers, the day after Commencement. But its best friends must censure its failure to give pupils the right attitude toward every-day life. The Students' Aid Committee of the New York City High School Teachers' Association reports that too many of its applicants exhibit a pathetic lack of initiative, with an inability to carry out simple orders. Out of 800 boys in a large evening school who sought employment through the committee, only eighteen appeared punctually, though explicitly ordered to do so. Of these eighteen, sixteen were instructed how to write letters of application, which they were to present on the following evening at 7:15:

> At the appointed time not one appeared. The first one when questioned remarked that he "didn't think it mattered." It was particularly specified that they were to write letters on unruled paper. . . . Not one had that kind. Some had foolscap, most of them had little sheets of cheap letter paper, because they thought it "would do just as well." . . . The matter of the letters was very indifferently expressed, and either the ability or the disposition to carry out instructions was absent.

These boys are not all dolts. They have simply never been taught to obey, or to take responsibility. They learn, says the committee, that "high-salaried teachers must be ready to hand out to them paper and pencil and pen." They are made flabby by too much coddling; and, after having been discharged from half-a-dozen small posts, easily lose faith in themselves, or else in the social order. Let them have vocational training, but, first of all, thorough drill in the indispensable art of attending to business.

With the passing of Sarah Orne Jewett, New England loses its most sympathetic interpreter—New England, that is, as the land of woods and hills and meadows and villages. Miss Jewett rarely went to the town for her subjects unless for the sake of momentary contrast. How large a part of her insight depended on actual acquaintance and how much came from instinct, matters little. In the portraiture of New Englanders who are distinctly *of* the country, Miss Jewett stood alone. It must be admitted that she shut her eyes to the grimmer sides of rural life. Abnormal deflections of character—greed, pride, envy, utter selfishness—work all the greater havoc with the Puritanic countryfolk, if once they penetrate the native moral fibre. Other authors, also women, have written of these sordid tragedies of country life. Miss Jewett either could not or would not see that side. To her mind the very fact of the open sky, the well-tilled farm-land, the spruce village street, set the people above those moulded by a more sophisticated civilization.

Yet this belief never blinded Miss Jewett to the essential humanity which she made it her business to portray. For her, character in its minutest phases stood foremost. And it was rarely weak character. To be sure, she never overlooked the individual foible, but hers are the foibles which inspire the reader's affection, not his scorn. "The Dulham Ladies," realizing the ebb of their prestige, taking their journey, timorously buying false hair, are never for one instant made despicable. And all Miss Jewett's work is sweetened by pervasive humor. And this often shades into pathos. Is the old lady who takes her first ride on the railway laughable or something quite the reverse? It is hard to say. If for nothing else, Miss Jewett's stories will live as the memorials of a locality and a people. She understood what lay beneath the surface. The whole type is epitomized in "Miss Tempy's Watchers," where the two women sit all night gossipping tenderly of their friend who lies dead in the room above. Their words seem, at present, to point elsewhere:

> "None of us has got her light hand at doin' things tasty. She made the most o'

everything, too. Now, she only had that one old quince-tree down in the far corner of the piece; but she'd go out in the spring and tend to it, and look at it so pleasant, and kind of expect the old thorny thing into blossomin'."

"She was just the same with folks," said Sarah Ann.

Rudyard Kipling was for a number of years the most convenient club, and perhaps the most fitting club, with which to belabor Mr. Alfred Austin. But it would require no great stretch of the imagination to conceive England's poet laureate himself as the author of Kipling's latest outburst against the radical measures of the Asquith Ministry:

> They said. Who has toiled? Who hath striven and gathered possession?
> Let him be spoiled; he hath given full proof of transgression.

Kipling as statesman and prophet never impressed himself upon the serious men of Great Britain. The trend of Imperial politics has been, at bottom, away from what his muse has pictured and urged. His chief grievance used to be that the mother country neither cared for nor watched over her daughter commonwealths sufficiently. The mother is now looking towards her daughters for aid and comfort in her depression. The lower breeds whom it was Britain's mission to keep down and govern without asking are now her allies in Japan, and participants in a larger share of self-government in India. The flannelled fool and the muddied oaf, it is true, have been going in for a little more voluntcer soldiering of late, but only because of a panic fear of invasion, and not out of a growing sense of Imperial duty. If now the flavor of Kipling's verse depart, wherewith shall the poet's reputation be salted? His swing and color created at least an atmosphere of exaltation in which the faults of his logic might be forgotten. But bad logic in doggerel can be only ridiculous.

Financial legislation in the German Reichstag seems to have reached a veritable *impasse*. Of the $35,000,000 of additional revenue which Von Bülow's original budget measure contemplated raising, over one-third, or $13,750,000, was expected from the inheritance taxes. But the Conservatives and Clericals refuse flatly to assent to this item, and in the Finance Committee have succeeded in defeating the project. Should the committee's action be reversed by the Reichstag, they declare that no further assistance may be expected from them. On the other hand, the Reichstag has evidently taken the bit in its teeth by sanctioning a yearly tax on bonds and shares to be calculated on the quotations of the year previous and on the interest rate which dividends declared bear to the capital value as measured by the market quotations. This latter tax the Chancellor has declared the government will never accept. The logical outcome would seem to be either a dissolution and an appeal to the country, or the retirement of Von Bülow.

A worldwide malady—this of financial ways and means, akin to Becky Sharp's problem of How to Live on Nothing a Year. Over the whole world the finance minister has first assented to new and generous outlay, and then comes his less congenial task of robbing the hen-roosts. Unfortunately, all the fowls have learned that in squawking there is a chance of safety, and the shrill outcry is continuous. In Great Britain the Board of Trade and the landed gentry protest against the pending budget. Under this fusillade two Cabinet Ministers' health has suspiciously failed and they have resigned. In Germany Von Bülow, while defiant in the Reichstag over his shattered budget, had to go to Kiel to consult the War Lord about the situation. In France the tax-machine has just been speeded up so as to overtake some of the security incomes which have failed to get out of the way. Even Cuba begins to show signs of progress in civilization. Her budget is behindhand. There is no chance of securing its passage by the constitutional date. They talk of passing a provisional supply bill, of unloading all financial responsibility on their President, and, as a last resort, of establishing a Government lottery, to be "a dependency of the Treasury."

The findings of the French parliamentary naval commission, under the presidency of M. Delcassé, make it evident that in France, at least, expenditure on ships is not only a crushing burden, but one that affords no effective navy. In the past decade, France has expended between 600,000,000 and 700,000,000 dollars on the navy. In this time, she has dropped from the second to the fourth place in naval strength, exchanging places with Germany, despite the lesser expenditure by that country. French battleships are shown to cost 50 per cent. more than the original estimate, and the report asserts that "negligence, disorder, and confusion" prevail at the navy yards. The Mediterranean squadron could not be a very formidable antagonist, if it had to discontinue firing practice, as the report asserts, because of the many defects in untested guns. Notable among the confessions of the commission is that as to the relative cost of building battleships. The same outlay that secures five in France, provides six in Germany, and six and a half in Great Britain. The lack of reserve coal and supplies of ammunition at various ports, so one officer testifies, would permit only six hours of continuous battle by the French navy. The theoretical estimates of the relative strength of navies will be shown some day to have neglected a factor of prime importance—the presence of common honesty and efficiency in public service.

The merits of the appeal to President Taft in behalf of two Congo missionaries depend entirely upon the kind of intervention called for. If our Government is asked to secure the quashing of the indictment for criminal libel which the Kassai Rubber Company has had brought against the missionaries, Mr. Taft ought to ignore the petition. To grant it would only interfere with the disclosure of the Central African situation. Whatever the defendants know about slavery and torture, they should tell under oath in a public courtroom. The things which have been done on the Congo are bad enough, but that is the strongest reason why they should not be overdrawn. In the present confusion and passing of lies, nothing could be more salutary than a fair trial of Dr. Morrison and Dr. Sheppard. Our State Department should see that the defendants' witnesses and evidence are suitably presented. The rubber company must be thwarted if, as is alleged, it is conniving with the Congo Free State authorities to pay off a grudge against the Americans who have exposed its barbarous practices. So much every citizen in foreign lands has a right to ask of his country.

PRESIDENTIAL INTERVENTION.

Nobody has ever laid down an absolutely sound, consistent, and comprehensive rule about the attitude of the President towards pending legislation. Both the Constitution and precedent leave so many doors open to Executive influence, that one of them can always be used with some show of reason. Critics will usually confess, when candid, or when driven into a corner, that it is a matter not so much of principle, as of taste and the personal equation. A cynical Senator once put the case as follows: "I like to have the President interfere with Congress, when he interferes on my side. That is a proper discharge of his high Constitutional function. But when he steps in to help the other fellows, it is not only unconstitutional, but a damnable outrage."

The President has the undoubted right to "recommend" legislation. But recommend is a "bountiful word." It may be made to cover not only the initial urging of laws by message, but speeches and other public deliverances in their favor. For such recommending of legislative measures, the President has, by the nature of his office, peculiar fitness. He stands detached from the purely local interests and the personal squabbles which too often govern the action of members of Congress. He is the directly elect of the whole people, and has come to be looked upon as a court of appeal, above Congress, and less subject than it to being swayed by petty motives. He is also the leader of his party, and as such concerned in shaping its policy so as to command popular approval. Thus there has always been, and exists to-day, a powerful reason why the pronouncements of the President touching proposed legislation should have great weight. The country, in fact, looks to him to be an originating and guiding statesman as well as to execute faithfully the laws. And if we concede his right to recommend legislation, we cannot well deny his right to take an interest in what he has recommended, and to strive in every lawful and proper way to bring it to fruition. We cannot conceive of a serious President seriously urging upon Congress an important measure, and then dismissing it from his mind as something with which he has no further concern. It is only a question of the means he may honorably and safely employ to further his ends.

Between the recommending message and the inhibiting veto, given him by the Constitution, there lies a large area in which the Presidential power to secure needed laws may be exercised. Private consultations at the White House have been immemorially held. There can be no challenge of their propriety, unless improper things are done at them. A President may seek to persuade a Congressman; he ought to attempt neither to bully nor to bribe him. Whatever else the framers of the Constitution may have contemplated, they certainly did not expect the President to use the patronage of his office in order to bend a Senator to his will. Yet this, of course, has often been done. It has been done, too, from good motives and in great emergencies. We suppose that there is no doubt that Mr. Cleveland made appointments to office for the purpose of securing the repeal of the silver-purchase law. The silver champions openly charged him with buying the bill's way through Congress by the use of patronage. But men like Senator Allison were ready to defend this, and to assert that it was God's mercy to the country that Grover Cleveland was in the White House to force the repeal of the disastrous legislation. There, again, we see how the President's action is judged according to personal bias. We are all inclined to agree with the old deacon who said that he believed in special Providences—"when he wanted to." If a wicked enemy's barn was struck by lightning and burned up, the manifestation of divine justice was obvious; but if his own crops perished in a flood, it was not Providence, but Satan, who was visibly at work. Similarly, most Americans believe in the special intervention of the President—when they want to.

An unpleasant impression is undeniably created, however, when the President becomes unreservedly and openly a legislator. We have just had the unaccustomed spectacle of a law actually drafted under the President's eye, and by his aid, and introduced in the Senate hot from the White House. It is known as the "Taft amendment." Senator Aldrich asked, not for a general plan, or suggestion, but for a completed bill. There was method in this, if not malice. Aldrich wished to spare himself the responsibility for either introducing or passing the measure. With a frankness never before seen in Congress, he stated to the Senate—and only those on the spot can say if he did it with a sneer—"Here is the President's bill." It had been viséd in every phrase at the White House. Now, we think that, saying nothing of the contents of the bill, it was unwise and undesirable to have it laid before Congress in this fashion. Should it be defeated, the result would be a deep wound to the President's prestige. If it succeeds, it will establish a precedent which, in ambitious and unscrupulous hands, might work great harm, and which could not fail to plague even Mr. Taft, since the effect would be to make men run to him to draft bills on all other subjects. It would have been better to maintain the appearance of aloofness from the actual devising and redacting of legislation.

Having put his hand to the plough, it is clear that President Taft will not look back. His course, thus far, has had the effect of keeping the Republican organization in both houses under control, and himself in control of it. That power he is now bound to use in a way not only to hold his party true to its pledges, but to care for the unrepresented consumer. The Washington report is that he is determined to do this; and such definite assurances as those the New Jersey Senators give their constituents that hides will be made free in the conference, imply that the President's wishes are to be more nearly met by the conferrees than they have been by the Senate. Only by a final tariff bill which will reasonably square with his promises, can Mr. Taft justify his intervention to save Aldrich from defeat. Upon that Senator's gratitude, however, we should not advise the President to count too confidently.

DENYING AMERICAN CAPACITY.

If the American polo players should demand that the English concede them 3 goals in the international match; if the foreign professional golfers should be compelled to give our natives half a stroke a hole, in the open championship; if our tennis experts should go over to try again to bring back the Davis cup, on condition that each game should be started 15-love in their favor; if Harvard should race the University of Cambridge again, first stipu-

lating that the English boat should have only seven oars; if the Wright brothers should ask odds in aeroplanes, and American yachtsmen insist upon a ten minutes' start over their German competitors—what would be said? There would be shouts of protest against such a reflection upon our strength and skill, such an insult to our national pride. Americans are ready to meet and beat the world on equal terms—in everything except commerce and trade. There we confess ourselves weaklings, and admit that our rivals will drive us from the field unless we impose a tariff handicap upon them.

Perhaps the most pitiable and certainly the most striking acknowledgment of our own inferiority yet seen in the Senate debate was made the other day when the duty on picture post-cards was increased by some 325 per cent. The souvenir or view-cards thus to be taxed are purely those for America. Senator Smoot explained for the Finance Committee that the business of printing them had "grown to mammoth proportions," and that the Germans practically supply our market. Hence, "to save this business," alarmed Senators, who had beheld the awful spectacle of "views of public buildings in Washington printed on postal cards made in Germany," were asked, in their downward revision of the tariff, to increase the Dingley rates on these articles by more than 300 per cent. It was agreed to without demur or debate. Yet this denial of American ingenuity, enterprise, and business ability was really as humiliating as if Congress were to declare war on Germany, provided that the Germans would agree to fight only one ship to our three.

The case of the picture post-cards is peculiarly flagrant. First, the German manufacturers must make or buy the photographs covering views in all parts of this country. Then these must be carried back to Germany, there reproduced and printed, then shipped to this country, paying freight and duties, to find here that the Americans confess themselves beaten even with such a great handicap in their favor. Now, under the natural conditions of American energy, what would be the first instinct of our manufacturers of view-cards, in the face of a good business taken away from them right under their noses? Why, it would be to "hustle" after that trade. Technical methods would be improved, the whole business would be carefully studied in detail, organization perfected, economies effected, production and distribution cheapened. But the long years of drugging ourselves with the tariff have killed off that kind of spontaneous joy in responding to competition, and we now solely think to win by taking a stiffer dose of protection. It is as if a Marathon runner, falling behind, should begin taking whiskey and cocaine as a means of conquering the more speedy runners.

For our part, we do not see how any healthy-minded American, with a due share of pride in his nation, can look without shame upon these tariff confessions that we are hopelessly behind in the race. We boast that we have a land dowered with unrivalled natural resources; we glory in the ready inventiveness and pluck of our people; our talent for business we exalt to the skies. And yet no single question of international competition in manufacture or trade or ship-building can be raised, without calling forth horrified cries about our inability to stand the pace The thing has become so settled a habit with us that we do not always see how craven and disgraceful it is. It is based, too, upon a glaring falsehood. It is not true that Americans are such incompetents as our tariff-makers would have it appear. On occasion, we can go out into the markets of the world and hold our own. The State Department has just lodged a protest with the Cuban government, because Americans were not invited to compete with foreign manufacturers of arms and ammunition, in furnishing recent supplies. But the simple-minded Cubans might well reply that they never dreamed that Americans could compete with foreigners. Is not our tariff a standing advertisement of our national backwardness and incapacity?

We can merely allude to the bad domestic effect of our confession that the combat is too sore for us. Refusal to meet the conditions of world-competition tends to throw us further behind than we really are; to make us cling to antiquated machinery and obsolete mills; to prevent us from improving by entering into the struggle for existence which makes for improvement. President Eliot has somewhere singled out these disastrous mental as well as physical effects of shirking competition, as possibly the chief evil of the protective system. It certainly can never have had a more shameful, if petty, illustration than in this admission by the Senate that the Germans can beat us in making souvenir cards for Smoot's own Salt Lake City, unless we tax them more than 300 per cent.

EXECUTIVES AND STRIKES.

The settlement of the strike on the Pittsburgh trolley lines illustrates a task imposed of late years upon the executive departments of our governments, Federal, State, and local. One who is curious to study constitutions in the making may profitably consider the growth of this new duty, which, through public opinion at first and latterly by express statutes, has devolved upon our administrative departments. When the Federal Constitution was drafted, there was fear enough entertained of the possibility of sedition, riot, and rebellion. Shays's Rebellion had been a warning which was not lost upon the members of the Constitutional Convention. But in the early, not to say primitive, industrial situation, and in the absence of any considerable number of large cities, our present difficulties were not dreamed of. We have come to the pass where the emergence of a large industrial dispute, especially when it involves the safety or convenience of the dominant third party—the Public—brings an immediate pressure upon the authorities to act as mediators or arbitrators The successive steps by which this position was arrived at are suggestive.

When industrial disputes of wide extent first began—such as the Pittsburgh railway riots of 1877—most impartial observers held the opinion that executive intervention must be limited to the maintenance of public order. The dispute between employee and employer was regarded as *privati juris*. Not until overt acts of violence occurred was the strong arm of the state to interfere, and then only to repress violence.

Most people were inclined to assimilate the strife to the draft riots of the civil war, and to see nothing distinctive in the industrial situation in which these difficulties arose. Old-fashioned believers in the delimited sphere of the executive were sternly averse to any intervention upon the part of the civil government beyond the maintenance of

Burlingame Public Library

the public peace. Pessimistic economists imagined that these difficulties were but a foretaste of what we must expect from an increasing population and a sharper struggle for the means of subsistence. The "Wealth of Nations" was used as a book of prophecy where Smith depicted how striking workmen "have always recourse to the loudest clamor, and sometimes to the most shocking violence and outrage," while their masters are "just as clamorous . . . and never cease to call aloud for the assistance of the civil magistrate." For example, Mr. Harrison, when President, repeatedly refused to be brought into industrial disputes. Even in the memorable Chicago railway strike of 1894, the use of Federal troops to suppress disorder was based upon the indisputable duty of the Executive to protect the mails and to keep the way open for the serving of the writs of Federal courts.

But, almost insensibly, the old order of thinking and acting in these matters has changed. We are no longer disposed to content ourselves with the reflection that offences must come, and to denounce woes upon their instigators. Official boards of arbitration, intervention, and mediation have been created by law. The United States Commissioner of Labor has been made a sort of official peacemaker for disputes involving interstate commerce, and has even intervened in difficulties like the recent strike on the Georgia Central, which was confined within the boundaries of a single State.

Three considerations have all combined to bring about this saner method of handling these disputes. First, the public has made it evident that its claims are, if not paramount, at least equal to those of the principal contestants. To such a degree has the public safety been exalted in this matter that in Pittsburgh, for example, power is given to the Mayor by law to seize and operate the trolley lines in case they cease to run and the rival disputants do not promptly come to terms. In an emergency he becomes a sort of industrial dictator. Moreover, the prestige which an impartial executive can command makes this a powerful club in his hands to enforce the counsels of "sweet reasonableness" upon the belligerents. The second consideration which has forced this new function upon the executive is the partisan consideration for "votes." In Philadelphia recently the hardships of enforced pedestrianism did not much weigh with the Republican machine. But the impending primaries loomed large on the horizon. Disgruntled employees and their numerous sympathizers might "smash" the slate. This made for prompt industrial peace. It was this consideration which gave the anthracite miners their vantage ground when the late Chief Executive was interested in corralling the votes of the multitude. A third cause which undoubtedly coöperates with the two first-mentioned is the realization on all hands of the wastefulness of interrupted industry. Pittsburgh's loss in a single day is estimated at two hundred thousand dollars. Nor does this include the thousand and one indirect items of inconvenience, personal injury, violence, and disorder.

Something of the same sort has been witnessed of late years abroad. Lord Rosebery, during his Premiership, was called upon to end a long-protracted strike through his personal arbitration, and the arbitrament was said to have been "floated through on champagne." The agencies making for this kind of industrial peace are as wholesome as they are inevitable. Constitutions are made for man, not man for constitutions. The blessings that attend on the peacemakers are enhanced, not diminished, when peace is made by this extra-legal prevention of industrial conflict, rather than through the belated disarmament of embittered foes.

OUR LADY OF THE SNOWS.

The rejection in the Senate last week of reciprocity arrangements with Canada in the matter of coal, is an instance of the alienating effects of our policy of protection. There is no estranging main between ourselves and our Northern neighbors, but the selfish greed of interests interposes between them and ourselves the equivalent of a sea of troubles. Similar in character was the retaliatory measure approved by the Senate aganst any country which imposes discriminatory duties on wood pulp exported to the United States. It requires neither a prophet nor the son of a prophet to see whom this provision is intended to menace.

American historians are tardily beginning to see that the Tories of the Revolution, however complacent they may have been towards Parliament's invasion of the colonists' rights, were not universally so contemptible a lot of poltroons as they appear in the popular opinion of the day. There were many intelligent and courageous men among them to whom the British connection seemed priceless, and who were wont to excuse the taxes imposed on the colonists on the ground that imperial defence demanded colonial contributions. Many of them left their homes and property and fled to Canada, embittered by their severe treatment in the colonies to the south. There thus existed a nucleus of United Empire loyalists in Canada whose harsh experience was a strong bar to political friendship with the States. The unsuccessful American invasion of Canada in the War of the Revolution, an invasion repeated in the War of 1812—where Canada at least was blameless of aggression upon our seamen—did much to consolidate the latent feeling of antipathy.

Two generations of peaceful commerce had rendered this feeling dormant when the conclusion of the Canadian Reciprocity treaty of 1854 seemed to promise fairer things. Unfortunately, the compact expired in 1866. The protected interests, owing to the high tariffs of the civil war, had had their first taste of blood, and at their insistence the treaty arrangements were terminated. How far it had made for international good feeling, however, was partly evidenced by the Canadian agitation for commercial union with the United States, or even for annexation, long after the present Dominion had been created. This, too, despite the Fenian flurry which had its breeding ground upon our own soil, though our government's hands were clean in that matter. There were, doubtless, unwise and premature movements made to effect a closer commercial or political union with Canada, which might profitably have been avoided. Color was given to the idea that transportation interests were selfishly concerned in the project. Moreover, the somewhat magisterial way in which Goldwin Smith issued his literary ukases on the subject was resented by many Canadians.

But with time and the intimate intercourse which a liberal interchange

of views and goods would certainly have produced, there was every reason to expect some sort of consolidation of the English speaking people of the northern continent. Yet this hope was frustrated, and the latent spark of Canadian nationality was fanned into a living blaze, mainly because of the unspeakably narrow selfishness of the protected interests in the United States.

How far this tendency toward national unity has progressed in Canada is hardly realized by this country. The old-time display of the stars and stripes along with the union jack is now confined to occasions when both nations are represented. The easy conscience with which the Canadian soldiery used to become the guests of American militiamen to the south of the border on the Fourth of July is, unfortunately, a thing of the past. Canada has accorded to British imports a preferential duty, and this, too, in the face of the British Parliament's refusal as yet to reciprocate in kind. The tide of public sentiment in Canada has been pretty completely turned away from closer relations with her southern neighbor. It flows strongly in favor of a united British Empire. Nor is the movement confined to sentiment. The Canadian militiamen served creditably alongside Tommy Atkins in South Africa. And now the example of Australia in promising a Dreadnought for the imperial navy is very likely to influence Canada in a similar direction.

It would be presuming too much upon their imagination, and assuming the existence of too sensitive a conscience on the part of the "standpatters," to suppose that they care a fiddlestick for the verdict that must be pronounced upon them at the Bar of History. But that they have induced their government to grasp at a shadow of wealth and to lose the substance of Continental unity, is all but indisputable. When it was proposed in Parliament to take away the powers of the British East India Company, John Stuart Mill made the Ministry look foolish by telling them that, while their predecessors had lost to the crown an empire in the West, the company's servants had added to the British dominion an empire in the East. A similar loss to our nation must be debited to the policy of exclusion we have followed and to the seifish greed and insularity of the McKinley and Dingley tariffs. The most far-reaching effect of the monstrous schedules on lumber and wood pulp will not be registered in the prices of these products. They will have converted the maple leaf into the national symbol of a proud rival Power.

THE DISADVANTAGE OF BEING FIRST.

This is the season when, in commencement halls and on the golf links, some men are carrying off the prizes, while others, the great majority, come in for consolation. But there is this difference between golf and the universities, that the man who is relegated to the second sixteen in a tournament knows himself an inferior player and is regarded as such, whereas in the colleges it has become almost a tradition that to be second-rate is to start out into the world with the very best prospects. The accepted belief among our gilded college youth that C is the gentleman's mark is more than a rule of caste; it is unconsciously subscribed to by many good people who feel that a student who gets his A's easily is as badly equipped for the serious business of life as if he were Shelley or Swinburne. What becomes of all the Highest Honor men and Senior Wranglers? Almost any one will tell you, and without thinking, that, as a rule, they are lost in the obscurity of some dusty professorial chair or pulpit; while railway presidencies and Senatorial togas are for the student who ranked fair either because he would not go higher or because he could not. We believe that even in writing the lives of great scientists and authors it is proper to begin by showing that as boys they preferred raising guinea pigs to studying arithmetic. This is what the commencement lecturer usually tells the graduating class; and properly so. After all, the world needs whatever encouragement it can get, and if a few men have the prizes, it is only fair that the others shall have the consolation.

Now, the handicap of being first is a little exaggerated. It is quite true that there is no disgrace in losing when one has done his best. But from this it is a long step to arguing that there is no particular glory in winning. If certain admirable qualities, such as concentration, the capacity for hard work, and persistence, will carry a man no further than tenth in his class, it does not follow by any means that the first nine places can be won only by men without concentration, persistence, or the capacity for hard work. The only just inference that runs against the honor man at college is that it is hard to be first in more things than one. If he has found the academic path easy, the presumption is that he will find it hard to excel in the social and diplomatic gifts that condition success in the outer world. But, after all, that is only a presumption. We take it for granted that the bookman often fails in life because he is a man of books, whereas most of the time he simply does not care for the kind of success by which we measure him. There are very few professorial positions that pay $100,000 a year, and there are still fewer clergymen and critics who command an income of half a million. What chance of fame or success is there, consequently, in the walks of life to which the honor man, as a rule, confines himself? It would be interesting to have a Federal statute compelling every Phi Beta Kappa man to go into the oil or the steel business. We should then be in a better position to judge whether collegiate distinction is a sign of incapacity.

But until such a law is passed we may admit that, judged simply by prominence and wealth, our honor man is not often so successful as the man who trailed him at college. Yet that is a condition which must change in the first man's favor as training and general culture enter more into our business, our social, and our political life. We may take the civil service as an example. So long as the spoils system ruled unchecked, it was inevitable that the henchman and the bribe-giver should fill the offices to the exclusion of better trained men who could not and would not compete with them in the muck of the political arena. With the development of the civil service, the opportunities for the bookman—under the appellation of "expert" he has grown quite popular of late—have widened. We are bold enough to foresee the time when a young man who has been excellent at his studies will find it easily possible to make a name for himself in the government service. So that the case as we see it is not one of the prizeman's unfitness for success, but for success un-

Burlington Public Library

der unfavorable conditions. While we had our enormous natural resources to fall back upon, any sort of rough and tumble business management would do; but the time for the trained man is surely coming. It has come to England, where college discipline has a value other than the social advantages it brings. Fine classical scholars have been known to attain high place in English life. It has come more emphatically still in Germany—this modern type of industrial progress which has found that efficiency is the fruit of training and that business victories are won in the schoolrooms.

Thus to insist upon the fact that proficiency at college means, if anything, a very moderate share of success in life is an indictment both of our public life and of our colleges. It is a poor sort of preparatory school whose best graduates are unfit for the work for which they are prepared. And it is a poor sort of social organization that can turn upon the young man who has taken its exhortations concerning wisdom and virtue to heart, and say to him, "Well, we don't think there is anything that you are very well fitted for, but we'll see."

FRENCH MEMOIRS AND HISTORIES.

PARIS, June 18.

The first volume of "La Franc-Maçonnerie en France des origines à 1815," by Gustave Bord, treats of those who wrought at the revolutionary idea from 1668 to 1771; it is a book of nearly 600 pages (10 francs, Nouvelle Librairie Nationale). This is a vital subject in the history of the transformation of the modern world. Freemasons are distinct from philosophers, to whom the agitation of minds leading up to the French Revolution is commonly ascribed, as a church is distinct from a religion. The great secret society, in which rationalist philosophy was organized as a militant political party, from its very secrecy and the mystic cover which it took for a disguise, presents difficulties without end to the historian who is free from passion in his investigations. This can hardly be said of the present work, which is openly hostile to the fundamental principle of revolution and Freemasonry alike. But its earnest and minute record of events and personalities not appearing in histories commonly known is immensely suggestive; and, in default of a completer and more impartial work, it is of great value for the understanding of so passionately controverted a period. It should be remembered that Professor Aulard, with all his vaunted documentary method, would scarcely prove less partial on the other side in the essentials of the history. It is to be desired that competent investigators should apply themselves to study how far Freemason lodges were responsible in England, and particularly in America, for the propagation of Rationalism in religion and revolutionary ideas of state authority and government.

In a volume of studies of Franco-Russian history and literature, Charles de Larivière publishes a first series on Catherine II and her pet philosopher, d'Alembert, on Buffon and Count Esterhazy, and on the youth of Nicholas I—"La France et la Russie au XVIIIe siècle" (H. Le Soudier). Robert de Crèvecœur re-edits with introduction and notes the first volume (Plon) of "Mémoires du Comte Dufort de Cheverny—l'Ancien Régime (1731-1787)." This comprises the period when De Cheverney held the important office of Introducteur des Ambassadeurs at the Court.

"Les Jacobins peints par eux-mêmes" (Lemerre) is a history of the Société Populaire et Montagnarde of the little city of Provins during the years of Terror, 1791 to 1795. It is compiled from the revolutionary society's own archives by Justin Bellanger, curator of the city museum and library. The genuine character of such documents concerning the progress of the Revolution outside of Paris cannot be overrated. "Madame du Barry" (Emile-Paul), by Charles Saint André, is a new documentary work concerning a victim of both the Old Régime, where she had been little less than a queen, and of the Jacobins, who cut off her head for its royalty. The competent Pierre de Nolhac authorizes the book with a preface; it presents a much more favorable account of its subject than has commonly been given, and throws many side lights on the decay of the old and on the bloody rise of the new order in France. The same publisher issues a book that helps to explain the mental and emotional attitudes of the society of the period of change—"Le Prestige de Jean-Jacques Rousseau"—reminiscences, documents, and anecdotes, written by Hippolyte Buffenoir.

Two books have new disclosures concerning decisive female personalities of the Revolution. "Madame Tallien" (l'Édition), by Louis Sonolet, gives a more authentic account of the extravagant career of this woman, whose life led from the old nobility into the prison of the Terror, and then into the arms of the man who had come to cut off her head, but lost his heart instead. Into this plebeian heart she instilled enough courage to overthrow Robespierre, which made her Notre Dame de Thermidor and one of the three queens of the extraordinary society which followed the Terror in Paris. She promptly turned her back on Tallien, who dropped into pathetic obscurity; and she died Princess de Chimay, long after the Bourbons had come back and France had had yet another revolution. She belonged rather to the cosmic than to the ethical order of things; and the instinct of self-preservation helped her to find means of relieving France at a critical moment from a tyranny greater than anarchy.

"L'Impératrice Joséphine" (Librairie Sportive), by K. Pichevin, tells once again the life of Madame Tallien's chief rival in the new society (Madame Récamier was the other). With great painstaking and documentary attempts at proof, the book is more charitable toward the early years of the Creole who became an Empress than most recent writers have been. The pathos of Josephine's later story has so permeated English, and particularly American, feeling that the book should be welcome. Joseph Turquan, an intelligent compiler, some of whose books have been translated into English, has for his new subject one whose fate in popular tradition is just the other way about from that of Josephine. The "last dauphine," whose early imprisonment in the Temple when her parents, Louis XVI and Marie Antoinette, were taken off to the guillotine, touches all hearts, had her later years unknown or judged with harshness. "Madame, duchesse d'Angoulême" (Émile-Paul) may not succeed in revising this popular verdict, which was based on little real knowledge; but it will make the earnest reader agree that, if this heroine of so many tragedies could have borne an heir to the Bourbon line, he would have turned out very different from the most Christian and very unkingly Comte de Chambord, who was the actual heir. This latter was the serious son of that immensely frivolous mother, the Duchesse de Berry, the story of whose fall is told in a volume which has other historic interest—"Le dernier Effort de la Vendée (1832)," by the Vicomte A. de Courson (Émile-Paul). Preposterous and useless bravery shown in a cause of doubtful worth and disgusting treachery on the part of those who represented what has become our modern system, add light and shadow to a story which is heroic, but not reasonable.

The second volume of the Duchesse de Dino's "Chronique de 1831 à 1862" (Plon) covers the important years 1836 to 1840, under King Louis Philippe. This niece of Talleyrand (by marriage), and the inseparable companion and confidante of his later years in London and Paris, took notes by the way which all but compensate the disappointment felt at the publication of her uncle's non-committal memoirs. Her own personality is not submerged; quite the contrary; and literary historians will be glad to have her impressions of George

Sand and Balzac as they pass before her, studying her with their literary methods and all unaware that they were being instantaneously photographed by this Frenchified German princess who had experienced wider worlds than their own. The reader is irresistibly persuaded of the essential goodness and common sense of the duchess, quite contrary to the effect produced by the lively Countess de Boigne, whose memoirs are of the same years and often of the same persons.

"Claude Fauriel, membre de l'Institut (1772-1843)," by J. B. Galley, is the kindly story of a man who began public life as private secretary of Fouché at the head of the Imperial police, and ended by twenty years of accepted work in exotic and mediæval literature. His views have passed; his methods remain. More interesting at this day are his curious relations with the future Madame Mohl, who was a sort of English immigrant Madame Récamier, less beauty and plus ideas, in the change of France from restored Bourbons to half-revolutionary Louis Philippe. The book is an outlook on the intellectual, rather than the political world.

Napoleon III is entering into the period of documentary memoirs, although he is far from having issued finally from that of passion, declamatory invective, and guessing generalities. Théodore Duret, in "Les Napoléons" (Fasquelle), gives some new matter concerning both uncle and nephew from the point of view of a partisan adversary. "Mémoires inédits sur Napoléon III" (Nillson) begins with what is called the Chislehurst Memorial by Baron d'Ambès; the first volume, "Jeunesse et Conspiration," will follow shortly. These profess to be papers of a familiar of the Emperor from his youth, and to form the first complete history of Napoleon III yet published in France. The interest of such a publication cannot be doubted, particularly in the present uncertain Bonapartist revival; but the earnest reader will seek further confirmation. The book of Frédéric Loliée on the Emperor's half-brother, to whom more than all others he owed his Empire—"Auguste de Morny" (Émile-Paul)—gives more evidence of its origin "from family papers and secret archives at the ministry of the interior." It is written in the usual lively style of this author, and, in fact, aims chiefly at portraying the society of the Second Empire. S. D.

NEWS FOR BIBLIOPHILES.

Two Rochester gentlemen, William H. Samson, editor of the *Post-Express*, and Dr. Wheelock Rider, both collectors of Americana, have entered the field as publishers by announcing a series of American tracts, to be known as the Rochester Reprints. They plan to issue photographic reproductions of the tracts issued by Eleazar Wheelock, telling of the progress of his Indian Charity School founded at Lebanon, Conn., but afterwards moved to Hanover, N. H., and named Dartmouth College. There are six of these, the first issued in 1763, the last 1775. Three others were published in England, these latter originating from the visit of Samson Occom, the Mohegan preacher, to England to collect funds for furthering Wheelock's school. No set, bibliographically complete, of these nine tracts is to be found in any one library. The first and second of these reprints are now ready. They are printed from zinc blocks on Strathmore Japan paper and bound in blue boards with side labels. One hundred and forty copies are issued, of which one hundred and twenty-five only are for sale. When the series is completed a general title, a biography of Wheelock, and an Index will be issued. The "Journal of a Missionary Tour in 1808 through the new settlements of northern New Hampshire and Vermont," by the Rev. Jacob Cram, has been printed by these gentlemen for the first time from the manuscript owned by Dr. Rider, who has written an introduction. Two hundred copies have been printed.

A New York collector has recently acquired two of the rarest and most interesting of the early books in English relating to the New World. Of the first of these, Cartier's "Shorte and briefe narration of the two Navigations and Discoveries to the Northweast parts called Newe France," 1580, only five other copies seem to be known, in the British Museum and Huth collections in England, and in the John Carter Brown and Lenox libraries and the Church collection here. The last-named, the Ives copy, is the only other, apparently, which has been upon the market during the last thirty years. This account, in English, was translated by John Florio from the Italian collection of Ramusio. The original French account of Cartier's first voyage was probably not printed at the time, but is known from a manuscript discovered in the Bibliothèque Nationale in 1867. An account of the second voyage, in French, was published in Paris in 1545 as "Brief recit, & succincte narration, de la navigation faicte es Isles de Canada, Hochelage & Saguenay & Autres," etc. Of this little book only a single copy is known, that in the British Museum.

The second of the two books referred to, almost equally rare, is the first of Richard Hakluyt's numerous publications, "Divers voyages touching the discoverie of America and the Ilands adjacent," 1582, with one of the two maps. Only three copies with both maps seem to be known, two in the British Museum and one (the Kalbfleisch-Lefferts copy) in the Church collection. The John Carter Brown copy lacks one of the maps and the Lenox copy has both in facsimile. Henry Stevens, who supplied such a large proportion of the Lenox books, tells how, in 1845, he sent his first consignment of books to Mr. Lenox. "By return of post every book was ordered except 'Hakluyt's Divers Voyages,' 1582, at ten guineas." Stevens further states, in that most charming of book-collecting books, "Recollections of Mr. James Lenox," that "this was his first great mistake in book collecting, which he mourned for many a day."

The "Divers Voyages" was entered in the Stationers Register, under the date of May 21, 1582. The record reads "Thomas Woodcocks, Licensed to him under the Bishop of London and bothe the Wardens Divers Voiages touchinge the discoue[r]y of America." The recently discovered copy of the book contains at the top of the title-page a Latin inscription to the effect that the book was purchased by Edmund Arndenell, a soldier, on the 22d of May, 1582.

Correspondence.

POE AND THE "SOUTHERN LITERARY MESSENGER" IN 1837.

To the Editor of The Nation:

Sir: The year 1837 is one of the obscurest in all Poe's history. Prof. G. E. Woodberry, in his recent revised life of Poe, holds that "less is known of Poe at this period than at any other." Of the poet's movements and activities for this year only this is known: that he resigned as editor-in-chief of the *Southern Literary Messenger* in January, the formal announcement of his resignation being made under the date January 3; that he was, however, despite this announcement, discharging some of the functions of the editor on January 9 (compare the letter to Gen. A. B. Magruder recently brought to light by Professor Woodberry), and that he was still in Richmond on January 17 (see the letter of that date to T. W. White); that he was in New York city late in May and early in June (see the letter of Prof. Charles Anthon of date June 1, 1837); that he republished his tale "Mystification" in the June number of the *American Monthly Magazine;* that he contributed a lengthy review of Stephens's "Travels in Arabia Petræa" to the October number of the New York *Review;* and that he was living in New York in the latter part of the year at No. 113½ Carmine Street (see the reminiscences of William Gowans in the New York *Evening Mail* for December 10, 1870). There is also a tradition of long standing that Poe left Richmond in January, and proceeded at once—or by slow stages, as one biographer has it—to New York city, where he hoped to establish a connection with the New York *Review*, and that he remained in the city for the rest of the year. But beyond this nothing has been made known—and nothing conjectured, so far as I am aware—concerning Poe's career during this year. There is, however, in a collection of letters long treasured up in this city, a letter of Poe's which makes one or two additions to our scanty stock of information, and which has been kindly placed at my disposal for publication. This letter was written to Mrs. Sarah J. Hale, the editor of *Godey's Lady's Book*, and is now in the possession of Mrs. R. H. Connerly, a granddaughter of Mrs. Hale. It reads as follows:

Richmond,
Oct: 20, 1837.

Dear Madam,

I was somewhat astonished to-day at receiving a letter addressed to "W. G. Simms, Esqr., Editor of the S. L. Messenger," and hesitated about my right to open it, until I reflected that, in forwarding it to Mr. S., I should place him in a similar dilem-

ma. I thereupon broke the seal—but the address, even within, was "W. G. Simms." I could arrive, therefore, at no other conclusion than that, by some misapprehension, you have imagined Mr. S. to be actually editor of the Messenger, altho' I wrote you, but lately, in that capacity myself.

Of course, under the circumstances, it is difficult to reply to one portion of your letter—that touching the prose article desired. If, however, it was your wish that I should furnish it, I am grieved to say that it will be impossible for me to make a definite promise just now, as I am unfortunately overwhelmed with business, having been sadly thrown back by late illness. I regret this the more sincerely as I would be proud to find my name in any publication you edit, and as you have been so kind as to aid the *Messenger* so effectually in a similar manner yourself. To send you a crude or hastily written article would be injurious to me, and an insult to yourself—and I fear that I could, at present, do little more.

As Editor of the *Messenger* I can however say that it will afford me sincere pleasure to do you any service in my power. I shall look anxiously for the "Ladies' Wreath."

I am surprised and grieved to learn that your son (with whom I had a slight acquaintance at W. Point) should have been vexed about the autographs.* So mere nonsense it was hardly worth while to find fault with. Most assuredly as regards yourself, Madam, I had no intention of giving offence—in respect to the "Mirror" I am somewhat less scrupulous.

With the highest regard,
I am
Yr. obdt.
EDGAR A. POE.

Mrs. Sarah J. Hale.

This letter establishes at least two things: one, that Poe was back in Richmond in the autumn of 1837; the other, that he was again posing as editor of the *Southern Literary Messenger*. That he was again editor-in-chief of the *Messenger* is not to be believed, since Mr. White advertised himself as editor in each number of the *Messenger* for 1837 after February; besides, Poe himself asserts in an article on Judge Beverly Tucker in his "Autography" that he "retired from the *Messenger*" in January. The probable explanation of his statement to Mrs. Hale is that he was again holding the post of assistant editor, as had been the case in the summer and autumn of 1835. There is nothing in the contents of the *Messenger* of this period that either contradicts or proves this view, but the October and November numbers apparently lend some support to it. In the October number is a review of N. C. Brooks's "Scriptural Anthology" which may very well have come from Poe's pen—Brooks had befriended Poe, and Poe was in the habit of repaying debts of friendship in this manner. And in the November number there are several articles that were perhaps written by him: the notice of "The American Almanac for 1838," the brief comment on the "Eclipse of the Sun in 1838," the review of Miss Sedgwick's "Live and Let Live," and the article on the "Exploring Expedition to the South Seas." Poe had noticed the "American Almanac" for 1837 in the *Messenger* for October, 1836; he was interested in things astronomical; he was an extravagant admirer of Miss Sedgwick and had reviewed several of her books in the *Messenger*; and he had already contributed two articles to the *Messenger* on the South-Sea Expedition. There is nothing in the December *Messenger* that can be credited to Poe—which falls in very well with Mr. Gowans's testimony that the poet was making his home in New York at the end of the year.

At what time Poe returned to Richmond for his last editorial service on the *Messenger*, it is impossible as yet to say. The September *Messenger* contains nothing that can be assigned to him. The article entitled "Helen Defended," though it deals largely with verbal inaccuracies and improprieties, is nevertheless not in Poe's manner; and the review of "Pickwick Papers" not only takes an attitude to Dickens at variance with that habitually taken by Poe, but was emphatically disavowed by him in the article on Beverly Tucker referred to above. In the July and August issues there is, in like manner, nothing that bears the peculiar stamp of Poe's critical work, the only thing in these numbers that can with any likelihood be traced to him being, in my judgment, the flimsy review of Motherwell's poems in the issue for August. It is also impossible to say how long Poe remained in Richmond after his resignation as editor-in-chief in January. In the February and April numbers of the *Messenger* there are, to be sure, sundry articles not hitherto associated with Poe which were probably from his pen; among them the review of Mrs. Eliet's "Marco Visconti" and the notes "To Our Readers" in the February number, and the review of Bird's "Nick of the Woods," the notes "To Our Readers," and the brief "Critical Notices," in the April number. But in order to give these to Poe it is not necessary to assume that he was in Richmond and on the staff of the *Messenger* at the time they were published; for it will be remembered that the January number, in announcing Poe's resignation, also announced that Poe would continue to contribute to the *Messenger* from time to time. Still it may yet be shown that Poe did not leave Richmond until several weeks—possibly several months—later than has heretofore been generally held.

KILLIS CAMPBELL.

The University of Texas, Austin, June 20.

*The reference is to Mrs. Hale's (trumped-up) autograph letter in Poe's "Autography," *Southern Literary Messenger*, II, p. 603, August, 1836. Mention is there made of the *Mirror*.

REFORM IN SAN FRANCISCO.

TO THE EDITOR OF THE NATION:

SIR: To one who knows at close range the heroic efforts in behalf of civic righteousness of the little band of prosecutors in San Francisco, and the incredible crimes committed in behalf of the defendants (including jury-fixing and dynamiting, for which some of the agents are in prison), it is disheartening to read such an editorial as appeared on this subject in your issue of June 3. Consider for one moment the results of the police raid on the United Railway Company's safes, which proceeding you deprecate—that there were found in the safes opened an aggregate of hundreds of copies of reports stolen from the district attorney's office. If the safe of a corporation official forms a more sacred asylum for stolen property against the search of proper officials, acting under due warrant, than does the trunk of a thievish servant girl, then the fundamental principle of equality before the law, upon which free government is based, falls to the ground. This epitomizes the issue really on trial in San Francisco.

The evidence shows your implications concerning Mr. Spreckels's motives to be unwarranted. Remember, that Mr. Heney placed Mr. Spreckels on the stand and "let down the bars," that is, allowed the defence utter and entire latitude in cross-examination without raising objections to any line of inquiry whatever, and that, under the most searching and severe questioning, nothing in any manner discreditable to him, or showing anything but proper and high motives, was developed. Here I write from personal knowledge, having been present in the court room during a large part of the cross-examination. That the prosecution did not originate in business rivalry, and that the charge against Patrick Calhoun is not due to malice or personal enmity are clearly proven by sworn testimony that the graft prosecution was planned in December, 1905, four months before the earthquake, and five months before the supervisors were bribed, the ordinance passed, the crime committed for the prosecution of which malice is now charged.

Mr. Spreckels testified directly and unequivocally that Mr. Heney has not received one dollar for his personal services, yet your editorial gives an entirely erroneous impression in this regard.

The detailed items making up the sum you mention were given in evidence as follows:

Francis J. Heney's Account.

Rent	$3,186.25
Office expense	1,522.02
Private exchange and operator	1,949.22
Telegrams	316.82
Postal and messenger expenses	280.26
Travelling expense	118.45
Office salaries	8,634.67
Office furniture	433.50
Auto and carriage hire	957.05
Stenographic and legal expenses	2,147.37
Detective expense	4,232.61
	$23,828.22

Said Gov. Folk, when he was out here a few weeks ago: "It has been the way of those who would discredit the prosecution of corruptionists everywhere, when they cannot attack the things that one does, they will always resort to the cowardly subterfuge of questioning the motives of one in doing those things. Not sincere? When you see a man upon the battlefield, risking his life in a fight against the public enemies, is it fair to ask if he is sincere? The mere fact that he is there demonstrates his sincerity." This is no child's play that these men are engaged in; murder has been attempted more than once against them.

When the whole struggle out here is seen in its proper significance it will be clear that no group of men has ever performed more patriotic and disinterested service for their country than has this small group led by Spreckels and Heney in the attack against that corruption of government by powerful predatory interests which uncombated can but result in the destruction of free institutions.

GUIDO H. MARX,
President Palo Alto League of Justice.

Stanford University, Cal., June 9.

"UNDESIRABLE CITIZENS."

TO THE EDITOR OF THE NATION:

SIR: I do not know whether it has been noted that the Quakers were the first class of people to be stigmatized by ex-President Roosevelt as "undesirable citizens." The passage occurs on p. 37 of his "Life of Ben-

ton," published in 1886, and reads as follows:

A class of professional non-combatants is as hurtful to the real healthy growth of a nation as is a class of fire-eaters; for a weakness or folly is nationally as bad as a vice, or worse; and, in the long run, a Quaker may be quite as undesirable a citizen as is a duellist. F. H. H.

Lawrence, Kan., June 19.

SCHON ALLES DAGEWESEN.

To the Editor of The Nation:

Sir: The truthfulness of the favorite quotation of Ben Akiba, the aged rabbi in Gutzkow's "Uriel Acosta,"

Und alles ist schon einmal dagewesen,

is beautifully illustrated in the *Scientific American* of May 9. The writer and many of the readers of an article in its columns on the phenomenon of seeing double will probably be surprised to learn that the explanation was old in the time of Lactantius, a Latin Christian Father who died in the early part of the fourth century.

I append a translation of section 9 of his "De Opificio Dei"—On the Work of God:

I may at this point reprehend the foolishness of those who attempt to prove the senses untruthworthy by assembling many instances of ocular illusion, among them the well-known fact that the mad and the drunken see everything double; as if, indeed, the cause of this error were at all obscure. For the reason why it occurs lies in this fact, that our eyes are *two*.

But *how* it happens, hear from me. What we see with our eyes rests at bottom upon the attention of the soul (*animus*). And the fact is, inasmuch as the mind (*mens*), as I have said before, looks through the eyes as through windows, that seeing double occurs not merely with the drunk and the insane, but with the sane and sober as well. For if you bring an object too near, it will appear double; because there must intervene a definite space before the lines of vision will converge into one point. Likewise, if you withdraw the soul, so to speak, in meditation, and relax the mind, then the line of vision of each eye is allowed to diverge again, and the eyes begin to have separate vision. If now you again become attentive and give conscious direction to your gaze, what seemed double merges into unity.

Why, then, is it to be wondered at if the mind, while weakened by the poison of strong wine, is unable to attend to its function of seeing, just as the feet fail to walk when the nerves are benumbed, or why is it thought strange if madness, fiercely attacking the brain, disunites the concord of the eyes? So true is what I say, that for the one-eyed, when they become either insane or drunk, it is absolutely impossible to see double.

How extensive is this unconscious plagiarism may be seen by comparing with the above the following from the modern explanation:

In order to see double, one must have two good eyes . . . and as there is nothing to prevent a one-eyed person from getting drunk, all drunkards do not necessarily see double. . . . When we wish to see distinctly, we automatically so adjust the eyes laterally, by converging them more or less, . . . that the image formed in each falls upon the sensitive point of the retina. If the object is too far off to enable us to get a distinct image thereof in either eye, we can do one of several things. We can bring it nearer, etc. . . . If we converge them (the eyes) so that the two images fall on the sensitive point of the corresponding retinas, we get in the brain a sharp image. If, however, from any cause, we are not able to move the eyeballs so as to have the image fall on the respective sensitive points of the retina, we see double. . . . This seeing double can be caused by temporary or permanent paralysis of either the inner or the outer lateral muscles of the eyeballs. For permanent paralysis there may be any one of several causes: for temporary paralysis, also, among these latter being the excessive use of alcohol or of tobacco, or of both together, or the effect of poison, as, for instance, lead. Under the influence of strong drink, the controlling muscles of the eye, like others of the body, are not under command; hence, some drunken subjects stammer in their speech, others stagger in their walk, and others see double.

Grant Showerman.

University of Wisconsin, June 19.

JOHN WOOLMAN'S JOURNAL.

To the Editor of The Nation:

Sir: Dr. Eliot's library, on a five-foot shelf, would be well worth while, if only for calling attention to a little book, the wisdom and charm and helpfulness of which are known, perhaps, to a limited number. It is a book to live with. William Ellery Channing pronounced it "beyond comparison, the sweetest and purest autobiography in the language," and Charles Lamb forestalled Dr. Eliot by saying, "Get the writings of John Woolman by heart."

I came to know of Woolman's journal some eight years ago, and have been reading it ever since over and over, in part and as a whole, with a continually increasing appreciation and joy in it. With all its other excellencies, it strikes a distinctly modern note, and fits into our deepest thoughts and questionings of to-day. John Woolman had the keen sense for truth, the broad and tender sympathy with suffering human kind, and the sensitive social conscience of the highest type of twentieth century men and women. He was a forerunner of Tolstoy and of all who, by self-surrender, recognize the brotherhood of man as the method of harmony with the divine will.

Copies of early editions of Woolman's journal are rare, and I noticed one selling at $13 at a sale a few years ago. An edition was printed in Philadelphia in 1774, and another in New York in 1775. The Whittier edition was printed in Boston in 1871, by James R. Osgood & Co. It has a long biographical and critical introduction by the poet. The Macmillans issued a reprint of the journal in 1903, a very handy little volume.

But to England belongs the honor of embodying the legacy left by this fine and saintly spirit, in a manner worthy of its high value. The journal was issued in 1901 in an *édition de luxe* by the Essex House Press, under the supervision of Mr. C. R. Ashbee. The inscription placed at the end of the hand-printed and vellum-bound book reads:

Here ends the Journal of John Woolman, the best of Friends. To whom the Essex House Press would do honor by recording his work in a manner worthy of him. To this end the book has been printed on the guarantee of Mr. John W. Pease and other Friends, with a frontispiece by Reginald Savage, and under the care of C. R. Ashbee.

An edition of 250 copies was printed. A copy was sent me by an English friend, who, in reply to my appreciation of it, wrote:

Very glad you like J. W. in his new English coat, but I don't know what he would say. His scruples about wearing dyed cloth suggest that he might have come under an exercise on the question of bleached vellum.

It belongs on the five-foot shelf, both as literature and as a philosophy of life.

Emma Winner Rogers.

New Haven, Conn., June 22.

Notes.

Sidney Lee has completed his Oxford lectures, and they will be published by Henry Frowde in the autumn, under the title of "The French Renaissance in England."

W. Heffer & Sons will bring out, early in the autumn, an edition of Plato's "Symposium," by R. G. Bury. This is said to be the first annotated edition of the dialogue produced in England.

George Moore has long been at work on a new version of his "Sister Teresa." The rewritten edition of the book is now issued by T. Fisher Unwin of London.

John Lane Company now announces that the author of "King Alfred's Jewel," the poetic drama, is Mrs. Spencer Trask.

Houghton Mifflin Company is about ready to publish a book entitled "1872: Letters written by a Gentleman in Boston to his Friend in Paris, Describing the Great Fire." It is the work of Harold Murdock, an eye-witness of the event, who, in these letters, gives an account of the fire, together with the current gossip of the street.

Dr. C. A. Gibson of 3 Drumsbough Gardens, Edinburgh, is preparing a life of the late Sir William Tennant Gairdner, and requests the loan of letters and documents bearing on the subject.

A letter from Prof. Charles H. Judd of the University of Chicago desires us to announce that, through the kindness of Professor Lamprecht and Dr. Davies of the University of Leipzig, arrangements have been made for a special room for Americans who visit the celebration of the five hundredth anniversary of the founding of Leipzig University. This room is at Goldner Bär, Universität Strasse 11. Americans should register at this place, and they will there receive any information they need.

The Selden Society publications for the year 1909 will be delayed. The society had hoped to give two volumes to subscribers, one the second volume of the "Records of the Star Chamber," by I. S. Leadam, and the other a volume of the "Year Book of the Kentish Eyre of 6 Edward II," by L. W. Vernon Harcourt. The death of Mr. Harcourt before his text was in the printer's hands has suspended the latter publication, and his successor as editor has not yet been finally chosen. Private affairs of I. S. Leadam make the volume by him uncertain. Under these circumstances, the society hopes to give its subscribers for 1909 before the close of the year, Volume V of the "Year Books of Edward II," edited by J. G. Turner, and to publish the volumes originally intended for 1909 at some later period.

Volumes XXI and XXII of the New York Edition of Henry James contain "The Ambassadors," which appeared in the *North American Review* as late as 1903, and which therefore gives no opportunity to the au-

thor to retell a young story in his old style. As is his custom in this edition, Mr. James tells us in the preface now added how he first got the idea for his tale, what it meant to him, and how he worked it out. As for the essence of the book he finds this in Lambert Strether's irrepressible outbreak to little Bilham in Gloriani's garden over the danger of wasting life:

Live all you can; it's a mistake not to. It doesn't so much matter what you do in particular so long as you have your life. If you haven't had that, what *have* you had? I'm too old—too old at any rate for what I see. What one loses one loses; make no mistake about that. Still, we have the illusion of freedom; therefore don't, like me to-day, be without the memory of that illusion. I was either, at the right time, too stupid or too intelligent to have it, and now I'm a case of reaction against the mistake. Do what you like so long as you don't make it. For it *was* a mistake. Live, live!

We may take this occasion to commend once more the clear type and pleasant page of this edition, which is published by Charles Scribner's Sons.

Two volumes of a sumptuous "Library of Southern Literature" (The Martin & Hoyt Co.), which is to stretch to fifteen, prove that America still leads the world in such publications. If any doubt remains on this point, President Eliot's forthcoming five feet of masterpieces will certainly settle it. These volumes from Dixie follow the model set by the late Mr. Warner's series, and follow it well. The critical and biographical introductions have been carefully prepared under the supervision of Prof. Charles W. Kent of the University of Virginia, and with the cooperation of a formidable array of college presidents, Congressmen, clergymen, and other distinguished people. It is true that some of the authors represented have been little heard of outside the States that claim them as citizens; but Mr. Griswold and Mr. Stedman shepherded many such sheep, and we shall not, like naughty boys, pelt with the stones of criticism flocks so piously tended. We may take the later volumes of the series as occasion for more general comment.

"Writing the Short Story," by J. Berg Esenwein (Hinds, Noble & Eldridge), is the most thoroughgoing and perhaps the most instructive treatise which has yet appeared upon this subject. Mr. Esenwein has the great advantage of being a magazine editor. He discusses his theme from the editorial point of view—in other words, he makes the final test of the excellence of a story its fitness for the market. His primary concern is plainly to expound practically the technique of a strictly "up-to-date" piece of work. At the same time he has based his principles upon an extensive induction, taking into consideration the practice of all the leading exponents of the form in several languages. Furthermore, he has utilized to good advantage the half-dozen books and half-hundred articles written by the pioneers in the theory of the art. If his book is the best, it is partly because it is the latest. But he has analyzed his subject and organized his ideas with unusual vigor and perspicuity. He has attacked the problems of the short-story teller, as W. T. Foster has recently attacked those of the debater, with a desire to be present at every moment of difficulty. Each chapter is followed by a summary and a substantial list of questions, which are really suggestive. There are full lists of materials for study, bibliographies, and an index. The book has all the features of a scholarly work. The emphasis placed upon novelties in phrase-making, plot, local color, titles, and narrative method suggests the peculiar strength and the peculiar weakness of this branch of the literary art. The elaborate formulation of the laws of the *genre* suggests that the period of spontaneous development is over.

Overtaken by a grievous malady, Arthur Symons may never write another line. The fact gives a pathetic significance to the re-issue of one of his most characteristic books of criticism, "Plays, Acting, and Music" (Dutton). Though somewhat revised, it is in the main, as before, the salvage of his journalism. But Symons carried journalism into the realm of art. His usefulness rested largely upon a combination, more French than English, of extreme sensitiveness with regular literary habits. An amateur of moods, a restless evoker of phrases to contain them, he kept them, after all, under a kind of discipline. A subtle analyst of the various impressions of beauty, his style was forthright. He required merely an attentive reader when his argument was most difficult. Being a symbolist poet, it was natural that he should work eagerly towards transpositions of the effects of other arts into the medium of his own, prose and poetry. He had fairly invented a method, something between description and suggestion, by which brief words may convey the feeling of music played by a particular artist, or the flavor of some particular evening when Irving, Bernhardt, or Duse acted magnificently. Possibly the most vivid memorials of these moments, for posterity, will be these terse paragraphs of Symons's. His specialty was in a fashion the ultramodern, to which movement as a poet he belonged, but he was never merely the eulogist of the art of the nerves. Indeed, he is often its most remorseless critic. In the present volume he is just to the acting of Irving and to that of the Sicilian players—in both cases alive to the limitations of the opposed *genres*. He can be enthusiastic about Maeterlinck without denigrating Ibsen. His idol Duse does not blind him to the admirable qualities of Julia Marlowe. Exploring Richard Strauss, he does not forget Bach and Beethoven. Pachmann moves him deeply, and so does Ysaye. Here is something more than the indifferentism of the hardened journalist. Symons retained his zest. Every contact with art was a great adventure. And he was at once so faithful to the thing in hand, and so mindful of that whole which we call art, that he is justified in calling a volume apparently composed of rather insubstantial scraps "a book of theory." His present disability will be a grief to all who have hoped for a criticism commanding the advantages of impression while retaining a rationalistic basis.

It is a question whether Prof. F. N. Thorpe's book, "The Statesmanship of Andrew Jackson" (The Tandy-Thomas Co.), has by itself a sufficient *raison d'être;* it belongs, however, to a series intended to exhibit the principles of American statesmanship in the writings of American statesmen, and in such a series we suppose Jackson could not be omitted. Jackson's state papers, which make up all but a very small part of the volume, are readily accessible in Richardson's "Messages and Papers of the Presidents"; and the question might also be raised whether they ought, in a series like this, to be credited to Jackson or to the other statesmen—Livingston, Taney, and the rest—who actually wrote them. Jackson's authorship of the seven letters on Nullification which Professor Thorpe gives will not, of course, be questioned. Grammar and spelling leave no doubt of it. But these, though interesting, are hardly enough to justify another bulky Jackson book. We are not sure, by the way, whether or not Professor Thorpe means to be taken seriously when he says, in his brief introduction, that Jackson's spelling "was but a premature use of the reformed spelling." In the "Biographical Outline" Jackson is said to have been born in South Carolina, and there is no allusion to North Carolina's claim, which Parton favored.

We have received from the Macmillan Company two large volumes, I and II, of the "Statistical and Chronological History of the United States Navy, 1775 to 1907," by Robert Wilden Neeser, Fellow of Yale College. The whole is to consist of five parts, and is to constitute a comprehensive reference work of our naval history. A most elaborate bibliography engrosses the first volume before us. The second contains Part i, "Administration of the Navy Department and Events and Dates of Reference in United States Naval History"; Part ii, "Engagements, Expeditions, and Captures of Vessels of War," and Part iii, "Captures of Merchantmen." To this is to be added Part iv, a "Complete Record of Every Vessel's Service and Fate," and Part v, "The American Privateers, 1772-1862, the State Navies, 1775-1783, and the Confederate States Navy, 1861-1865." These last two parts will not be finished for some time to come. The author states that "the researches necessary for their completion will cover a number of years, and it would not, therefore, be wise to make any promises." As a work of reference the two books now before us are indispensable to every library and newspaper office and for any student who has hereafter to deal with naval questions. It is evident that effort has been made to render the record accurate in every detail. There is no attempt at a narrative, but simply a brief record of each happening. Mr. Neeser's method and painstaking accuracy may be seen from the following sample record of a prize capture in 1863:

Date—1863, April 20. *Position*—Bull's Bay, S. C. *U. S. Vessel of War*—Lodona. *Class*—S. Str. *Guns*—7. *Commander*—Act. Lt. E. R. Calhoun. *Prize Vessel*—Minnie. *Class*—Schr. *Nationality*—British. *Cargo*—Salt. *Where from*—Nassau. *Bound to*—Baltimore. *Sent to*—Philadelphia. *Remarks*—Condemned.

Copious references to the sources, both original manuscript and printed, follow. In giving accurate and complete information as to the history of the navy, together with a full analysis of the sources consulted, Mr. Neeser has undoubtedly been successful in filling a great need.

L. H. Greenwood's edition of Aristotle's "Nicomachean Ethics, Book Six" (G. P. Putnam's Sons) is the best analysis and exposition of that difficult treatise with which we are acquainted. No commentary can make easy reading of Aristotle's discussion

of the "intellectual" virtues, because it involves in the highest degree that interpenetration of ultimate and still unsettled philosophical problems with questions of mere Aristotelian philology or Greek usage which makes many of Aristotle's writings so much harder than they seem. It is impossible for ethical theory to reunite the intellect and the will when we have once allowed psychological analysis to divide them. Ideally "good" conduct depends on (1) the intellectual apprehension and volition of a good end, and (2) the intellectual apprehension of the means. Adopting φρόνησις as the best available Greek word for intelligence in relation to conduct (as opposed to σοφία theoretic wisdom), Aristotle merely evades the problem by saying that the right end is not revealed except to the man whose will is good, and that where the end is not good we will call intelligence with reference to means either δεινότης cleverness, or πανουργία knavery. This is excellent Platonic rhetoric but no solution. Since, then, final philosophic consistency is not to be expected, we need not with Mr. Greenwood stumble over the passage 1142 b 35, in which φρόνησις is spoken of as the right apprehension of the end and not merely of the means. Φρόνησις is moralized intelligence of the relation of the means to the end. But it cannot be moralized unless the end is right. To go over the whole ground in this way with Mr. Greenwood exceeds our scope. It is enough to say that his translation is accurate, his notes evade no difficulties, his Introduction successfully refutes the arguments for the Eudemian authorship of the book, and his two essays on dialectic method and formal accuracy in the sixth book are full of suggestion and instruction for the student of Aristotle.

The Old Persian inscriptions of the Achæmenian King, Darius Hystaspes, on the cliff of Behistun, by all odds the most important early epigraphical records of the Indo-Germanic race, have twice been carefully examined within the last few years, by Prof. A. V. Williams Jackson of Columbia University in 1903, and by L. W. King and R. C. Thompson of the British Museum in 1904. The work of these scholars has gone far toward elucidating many problematical readings recorded by Major Rawlinson in his great edition of the Old Persian inscriptions, published in 1846-47; and while it is by no means impossible that some fragments may yet be found of the copies of the inscription which Darius expressly declares that he sent "into all lands" (one of eight lines has, in fact, been discovered by Koldewey at Babylon), we are already in a position to regard the text of the Achæmenian records as approximately fixed. In view of all this, Prof. Herbert C. Tolman of Vanderbilt University, the leading American authority on Old Persian, has issued, in his "Ancient Persian Lexicon and Texts" (American Book Co.), what must be regarded for many years to come as the best edition thus far made, not only of the Behistun texts, but of the entire body of Old Persian inscriptions. The volume is adapted equally to the most advanced specialist in Old Persian and to the beginner. The text is admirably printed, every reading which the original cuneiform script renders obscure (as *vazarka*, "great," instead of the more common reading *vazraka*) is fully justified either in the footnotes or in the vocabulary, and the translation is most faithful. The *cruces* in the text are treated with the utmost care, and the few *lacunæ* which can reasonably be supplied are filled with plausible conjectures. The lexicon is equally admirable. Every form of each word is given, together with copious etymological equivalents, not only in Avesta, Sanskrit, etc., but also in such modern languages as Afghan, Baluchi, and the Persian dialects. The author is in complete control of the literature of his subject, to which he gives full references; and it is especially gratifying to note that he has directed particular attention to the lexicographical light thrown upon the Old Persian vocabulary by the marvellous manuscript discoveries of the Grünwedel-Le Coq expedition to Chinese Turkestan.

A book of great value, for all students of Zoroastrianism and of Oriental religions in general has been prepared by Ervad Maneckji Nusservanji Dhalla in his "Nyaishes or Zoroastrian Litanies" (Columbia University Indo-Iranian Series, Vol. VI). This comprises the transcribed Avesta text with the native translations in Pahlavi, Sanskrit, Persian, and Gujarati, and an English version of both the Avesta and its Oriental renderings. Particular interest attaches to the Pahlavi commentary (of which Dr. Dhalla had eighteen manuscripts at his disposal) and to the Persian version, both of which are here satisfactorily edited for the first time. The variant readings of the Pahlavi manuscripts are fully given, and all passages in the English version which require elucidation receive attention in a separate appendix of notes. Dr. Dhalla announces a similar volume on the Yashts for the same series, and, it is to be hoped, will ultimately edit in like fashion the Visparad, Gahs, and Afringans. A work which would thus parallel the Pahlavi text of the Vendidad and the edition of the Gathas by Professor Mills of Oxford would be invaluable to all interested in the religious thought of ancient Persia.

Vol. XXXVI, part i (pp. 162), of the *Transactions of the Asiatic Society of Japan*, contains five papers of notable value. Dr. Timothy Richards, surveying Chinese history, treats of the problem of life in New China. He believes there is hope for the Chinese if they recognize that the fundamental principles found in Confucianism and Buddhism are in perfect accord with the principles of Christianity. Dazai Jun's essay on "Adoption and Marriage" opens a great window into Japanese social life. Professor Kato reveals the primitive monotheism of Japan in treating of the ancient Shinto God Deity-Master-of-the-August-Centre-of-Heaven, one of the triad in which are the Lofty-Producer and the Divine-Producer. While the two latter have always been very popular and their shrines numerous, no authentic shrine was ever dedicated to the Supreme Deity. The chief article is upon the "Life and Teaching of Nakae Toju," born in 1608, the expounder of the philosophy in which the makers of the New Japan were trained. Confucianism, as recast by Shushi in China in the twelfth century, was fixed as the orthodoxy of Japan by the Yedo shoguns for political ends, to traverse or attack which might mean imprisonment or death. The newer philosophy of Oyomei (1472-1528), as expounded by the Japanese independent thinker, the contemporary of Sir Thomas More, Tyndale, and Descartes, saved Japan from the deadening clutch of a single school. While Shushiism stood for arbitrary power, Oyomeism asserted the rights of the people, even to revolt against a bad ruler, and so trained the spirits who overthrew the shogun and feudalism. The chief categories in both schools were the same, but Oyomei made ethics, not philosophy, the central interest, and in practice identified thought and action.

A most entertaining and in many respects quite remarkable book is Gräfin Elizabeth von Montgelas's "Von meiner Löwin und anderen Lieblingen," just published by the Graphische Kunstanstalt, in Munich. The authoress is a warm friend of horses, dogs, and cats, as well as apes, leopards, and other fierce beasts, which she shows great tact in taming and domesticating. Wild and vicious horses, which had been abandoned as intractable, she has often succeeded in breaking and wholly subjecting to her will. Especially interesting is the account of her experience with a lioness, which she bought, when it was three months old, from a collection of animals in Nuremberg. On her way home with her purchase she was obliged to wait an hour or more for the train in Munich, where she let the young lioness run about in the station and amuse the people by its pranks. A policeman deemed it his duty to investigate the unusual exhibition, and asked her what kind of an animal that was. She replied that it was a "Nublan cat," knowing that she would probably get into trouble if she said that it was a lioness. This information seemed to be satisfactory, since a cat of any kind could not be a source of public danger. At home her pet enjoyed the same freedom as a cat or dog, but was far more expensive to keep, since it consumed ten or fifteen pounds of meat every day. It disliked the sound of the piano, and tried to push her aside with its head and to seize her hands with its paws when she was playing, but desisted when she boxed its ears. She never permitted it to have its will in opposition to her own, but always asserted her supremacy. She speaks of it as very vain, but adds that this characteristic is quite natural, if we take into account its beauty and its sex. The volume is rendered additionally attractive by numerous illustrations. The proceeds of the sale will be devoted to the proposed establishment of a zoological garden in Munich, a project in which the Countess takes a lively interest.

Sarah Orne Jewett died June 24, at her home at South Berwick, Me., after an illness of many months. She was born in 1849 in the house where she died, a pretty colonial building erected more than 150 years ago. Her father, Dr. Theodore H. Jewett, for many years a physician of wide reputation and practice, possessed historical and antiquarian tastes. Owing to Miss Jewett's delicate health most of her education was received at home under the supervision of her father, and a glimpse of their happy companionship is given in "A Country Doctor." Her first story for the *Atlantic Monthly* was accepted before she was twenty. "Deephaven" was her first success, and since then she has published a long list of books, including "Play Days,"

"Old Friends and New," "Country Byways," "The Mate of the Daylight," "A Marsh Island," "Strangers and Wayfarers," "The Story of the Normans," written for the Story of Nations Series; "A Native of Winby and Other Tales," "Betty Leicester's English Christmas," "The Queen's Twin," and "The Tory Lover" (1901).

From Paris comes the report of the death of Claude Motteroz, at the age of seventy-eight. He was known as the editor of *L'Imprimerie*, and as a printer of many handsome books for the Maison Quantin, and afterwards for the Librairies-Réunies.

Prof. Ernst von Halle, the well-known writer on political and naval topics, has died in Berlin at the age of forty-one. In 1895 he published in English "Trusts in the United States" and in 1908 "Rise and Tendencies of German Transatlantic Enterprise." Among his German works are "Reisebriefe aus Westindien und Venezuela," "Die Seeinteressen Deutschlands," "Volks- und Seewirtschaft," 'Die Schiffsbauindustrie in Deutschland," "Handelsmarine und Kriegsmarine," "Einfluss der Seemacht an die deutsche Geschichte," and "Weltproduktion und Welthandel."

THE JACOBEAN BOCCACCIO.

The Decameron. Preserved to Posterity by Giovanni Boccaccio and Translated into English Anno 1620; with an Introduction by Edward Hutton. 4 Vols. [The Tudor Translations, edited by W. E. Henley: Vols. XLI-XLIV.] London: David Nutt.

The first English translation of the Decameron was published, anonymously, in 1620, in two parts, each in one volume. By 1625 Part One seems to have been out of print, while copies of Part Two were still on hand. Part One was then reprinted and sold together with the remaining copies of the original issue of Part Two. Some sets are therefore dated in this apparently anomalous fashion: Volume and Part One, 1625; Volume and Part Two, 1620. From the note at Vol. I, p. cxxvii of the present edition, it appears that one of these sets has been chosen as the basis of this reprint.

The choice is to be regretted, not only because of the greater value of a consistent reprint of any one edition—an *editio princeps* at that—but for another reason as well. The title-page of Part One, as here reprinted (p. 1), reads: "The Modell of Wit, Mirth, Eloquence and Conversation. Framed in ten dayes, of an hundred curious pieces, by seven honourable Ladies, and three noble Gentlemen. Preserved to posterity by the renowned John Boccaccio, the first refiner of Italian prose, and now translated into English. 1625." In order to place the name "Decameron" in the title of the reprint, Mr. Hutton was obliged to substitute the hybrid if not actually misleading title which heads this review. Now, the *editio princeps* offered a perfectly clear and unaffected title-page: "The Decameron. Containing an hundred pleasant Nouels. Wittily discoursed betweene seauen honourable Ladies, and three noble Gentlemen. In two Parts. 1620." Of any reason for choosing the 1625-1620 set Mr. Hutton says nothing.

Nor does he explain a matter still more essential—the relation of this book to the original Decameron. Let not the unwary reader suppose that here he has Boccaccio before him, even in an inaccurate version. It is a far cry indeed from the real Boccaccio to this affected, moralized, and emasculated Jacobean translation—utterly void of joy, deficient in pathos as in humor, and quite degenerate from the Elizabethan splendor of style. What has happened to the Decameron?

The earliest list of prohibited books to condemn the Decameron is believed to be that known as the Index of Paul IV, issued by the Roman Inquisition in 1559. Its entry hints at a possible expurgation:

> Boccatii Decades seu novellae centum, quae hactenus eum intolerabilibus erroribus impressae sunt, et quae in posterum cum eisdem erroribus imprimentur.

The suggestion was effectuated by the Council of Trent, which in 1564 placed on its Index Librorum Prohibitorum

> Boccacij Decades, seu novellæ centum, quandiu expurgatæ ab ijs, quibus patres rem commiserunt, non prodierint.

Accordingly, in 1573 there was published at Florence (Giunti) a version "ricorretto et emendato," that is, expurgated as ordered by the Council, and as approved by Popes Pius V and Gregory XIII. Upon this text and the Mannelli MS. the Cavaliere Lionardo Salviati based his famous version—Venice, 1582 (Giunti)—which professes to differ from that of 1573 only in verbal changes specified at the end, but which in fact here and there changes the *novelle* themselves. The editor, like the Florentine *Deputati* of 1573, professes to offer a text "alla sua vera lezione ridotto"; and as the reward of his conformity receives a gorgeous array of *privilegii*. Nevertheless, in 1588 (and again in 1590) at Venice (Zoppini Fratelli & Onofrio Farri) there was published an independent version "Di nuovo riformato"—that is, with mutilations differing from those of other texts—by Luigi Groto, a blind man of Adria, with the license of the Venetian Inquisition. Probably there were other versions of the same kind. Their common characteristic is that in general they leave Boccaccio's licentiousness without essential change, but so modify his *dramatis personae* that the church shall not be scandalized. Thus the offensive stories are told no longer of abbots, friars, monks, nuns or other ecclesiastical persons, but of lay folk—students, judges, princesses in retirement, and the like. In Salviati, the Angel Gabriel becomes Cupid (IV, 2); Fortune, that pagan concept, is dropped from the story of Rinaldo d'Este (II, 2); Masetto da Lamporecchio is a Hebrew youth, who tends the garden of a seraglio near Alexandria, belonging to the Soldan of Babylon (III, 1); and the tale of Alibech and Rustico (III, 10) is turned into mere nonsense.

The English translation of 1620, as Koeppel has pointed out, is based upon Salviati. Of this fact, the exact correspondence in nomenclature and treatment of such stories as II, 7; III, 1; and IV, 2, in both versions, leaves no doubt. The English translator's frequent though inconsistent use of French forms for Italian names suggests that he had before him, together with Salviati, a French text—perhaps the old translation by Laurens de Premierfaict, which was reprinted as late as 1541, or the newer translation by Antoine le Maçon (first ed. 1545, often reprinted). That he did not *translate* from Le Maçon is certain. Le Maçon follows the real Decameron faithfully.

Beginning, then, with a mutilated text of Boccaccio, the English translator proceeded to take further liberties. First he restored, in many places, the ecclesiastical personages of the real Decameron: *e. g.*, though he retained Salviati's "God Cupid" instead of Boccaccio's Angel Gabriel, he restored *Friar* Albert instead of Salviati's marriage-broker (IV, 2); and permitted the errant daughter of the King of England (II, 3) to reappear disguised as an "Abbot," not as Salviati's *Cavaliere*. Naturally, in Protestant England the translator had little interest in saving the Church of Rome from scandal—rather the contrary.

On the other hand, Protestant England was rapidly becoming Puritan England; at least, a considerable portion of its reading public would not buy Boccaccio unexpurgated. More important still, the translation had to be licensed. In 1587 the Archbishop of Canterbury had authorized the printing of the Decameron in Italian; but as no copies of this edition have been found, nobody knows whether the text was mutilated or unmutilated, or whether it was ever printed at all. In any case, times had changed. Under date of "22° Martij, 1619" (N. S. 1620), the Stationers' Register contains the following entry:

> Master *William Jaggard*, recalled by my lord of Canterburyes comand. Entered for his copie vnder the handes of Master TAUERNOR and Master Swinhowe, warden. A booke called *The Decameron of* Master JOHN BOCCACE *Florentine. . . . vjd.*

"So this edition of Boccaccio," is Prof. Arber's comment, "was licensed by the Bishop of London through his secretary, and that license afterwards

revoked by the Primate." The years 1619 and 1620 (both O. S. and N. S.) show no further entry of the Decameron. Was the book printed and issued between the time of the license and that of the revocation, and then suffered to remain unsuppressed as having been published innocently? Or did it undergo further changes, and receive a second authorization, not entered in the Register? Certainly the changes which have left it in its present form were radical—genuine expurgations as we now understand the term. Rinaldo d'Este marries the widow (II, 2); Ricciardo Minutolo repents, while "Catulla" dies in despair (III, 6); Alibech and Rustico (III, 10) vanish altogether, and in their place appears the tedious edifying tale of "Serictha" (Syritha), Princess of Denmark, taken, via Belleforest, from Saxo Grammaticus. Moreover, each tale is provided with a moralizing caption, *e. g.* (IV, 2): "The Second Novell. Reprehending the lewd lives of dissembling hypocrites; and checking the arrogant pride of vaine-headed women."

Finally, the translator injected into the style his own preciosity and bathos. Of his version as a monument of English prose let one specimen suffice—taken almost at random, from that pathetic story of Isabella (IV, 5) which Keats immortalized. Would he have been inspired by this?

> At these harsh words, Isabella fell into abundance of teares, where-among she mingled many sighes and groanes, such as were able to overthrow a farre stronger constitution.

The old immortal pages, indeed!

Concerning all this—the *provenance*, the bibliographical and literary history, and the style, of the translation which he professes to introduce—Mr. Hutton says (p. cxxiv): "In 1620 the first practically complete edition appeared, *translated inaccurately, but very splendidly, apparently from the French version of Antoine le Macon (sic)*." This, and nothing more. It would be difficult to frame another assertion which, so meagre, should yet be so misleading and inaccurate. There is no excuse for the attribution to "le Macon"; for Mr. Hutton had before him Koeppel's valuable article (*Quellen und Forschungen*, Vol. LXX), which shows that Salviati was the source.

Assuming that the reader of the present translation has no desire to know what it really is, or how it came to be so, Mr. Hutton makes the further assumption that the reader *is* interested in the *chronique scandaleuse* of Boccaccio's birth, of Fiammetta's birth, and of their amour. To gossip of this sort he devotes rather more than the first half of the Introduction. True, these circumstances (p. lvii) "decided the rest of [Boccaccio's] life, and are in many ways by far the most important in his whole career." But that life and that career, set forth at such disproportionate length, vanish, as Mr. Hutton himself repeatedly assures us (pp. x, c-ci), in the complete impersonality and objectivity of the Decameron. It is not clear why he should give so much valuable space to matter, often controversial, about a life which leaves no trace upon the book in hand.

Next in bulk to the biographical matter comes the detailed comment upon Boccaccio's works other than the Decameron—a comment of doubtful relevancy, as Mr. Hutton perceives in the case of the "Ninfale Fiesolano" (p. lxxxii): "The story—but what does the story matter here?" etc. What does it matter, indeed, in introducing a translation of the Decameron? Almost everywhere, Mr. Hutton falls between these two stools, now neglecting to give his readers information they need and look for, now offering them information which, interesting as it may be, is far from the purpose.

When Mr. Hutton at last (p. c) reaches the Decameron, his criticism once more defeats expectation. "The greatest story-teller in the world! Does that seem a hard saying?" Such an opening leads us to expect—what, indeed, were greatly to be desired—a study of just wherein consists the excellence of Boccaccio's narrative art. Probably nothing else would so swiftly and effectually have illuminated this subject as a brief comparison of almost any one of the more highly developed *novelle* with its sources. The story of "Tito and Gisippo" (X, 8), for instance, is founded upon an excessively bald and jejune tale from the "Disciplina Clericalis" of Pedro Alfunsi (after 1106) and upon an excessively diffuse Old French poem, "Athis et Prophilias" (about 1200). Boccaccio, with artistic purpose, expands the first and contracts the second; chooses from the second his opening and from the first his close; and largely adopts from the second—here an excellent model—the distribution of his material into stages and scenes, the location of the events in Athens and Rome, and the use of dialogue, soliloquy, introspection, and pathos. Even Boccaccio's mistake—the placing of a long rhetorical harangue in the mouth of his Roman hero—has its own significance. It is in such crucial choices that the literary craftsman can be seen at his work: here—in his infusion of life and human character into this mere ὕλη of mediæval story—here Boccaccio's "humanism" is indeed made manifest; both his "interest in whatever has interested mankind," in the continuance of the great humane tradition, and his skill in remoulding it to the ends of art. But instead of this or any other solid literary study, what Mr. Hutton offers by way of criticism of the Decameron is, first, a lengthy quotation from the Prologue, describing the circumstances and the scene wherein the stories were told—the very same matter that we are soon to read in the reprint itself; then, apropos of the scene, a discussion, partly controversial again, of whether Poggio Gherardo and the Villa Palmieri are really the places Boccaccio intended; and, more generally, such sophomoric *obiter dicta* as the following (p. xi):

> The most human writer that the Renaissance produced in Italy, [Boccaccio] might seem in humanism to have had but two rivals in the awakening world, Chaucer and Shakespeare, who as it happens were the one a lesser and the other a far greater man than he.

This frothy superficiality is the more disappointing because now and again Mr. Hutton has a really keen *aperçu*: "[The Decameron] deals with man as life does, never taking him very seriously, or without a certain indifference, a certain irony and laughter" (p. cxv). The comparison of Chaucer with Boccaccio (p. cvi-cviii), concluding that the one excels in the characterization of his narrators, the other in the plot and the setting of his narrative, is sound criticism. The account of Boccaccio's relations with Petrarch shows genuine insight into one of the "varieties of religious experience," that anomalous outgrowth—so frequent in the Renaissance and so difficult for the non-Latin to understand—of mysticism from sensuality.

The causes which explain the late appearance of this translation also explain in part its failure to influence English literature. Puritanism was come, and "it was never merrie England since." But there were other causes. The Italian *novella* had had a magnificent, a double, "fortune" in England. It had inspired similar English *novelle*, and then it had found upon the Elizabethan stage the form most completely expressive of that single dramatic situation wherein the essence of the *novella* consists. Now its day was passing. The Elizabethan drama was in its decline; and fiction was turning to the more elaborate, expansive, and structural forms of the romance, from which it was acquiring that *longue haleine* which is the condition precedent to the novel. As Rohde has suggested, the relation of the *novella* to the heroic romance of the seventeenth century—and, we may add, to the modern novel—is much the same as the relation of the Milesian tales to the "Æthiopica." In neither case does the greater form build itself up out of the lesser; the difference is a difference in kind. The *novella*, despite its recurrent vogue at the Restoration, never again inspired in England any great form of literature. The translation of 1620, then, came *post festum*, and made no particular impression upon English writers. So that the present reprint, unlike the reprints of Hoby's

Castiglione, Fenton's Bandello, Underdowne's Heliodorus, Silvester's Du Bartas, and others of the Tudor Translations, is scarcely more than a literary curiosity.

The proofreading of the Introduction leaves much to be desired. It would be charitable to attribute the following to the printer: "Fiammetta's mother (whom he has told us was French)" (p. xlv); "And then her eyes, it is always them he praises best" (p. lii); "oppogiato" for *appoggiato* (p. xxxii); "precursi" for *precursori* (p. lxxi); "ò" for *è* (p. lxxvi); "Clectophon" for *Cleitophon* (p. lxxxii); "Stipendari" for *Stipendiarii* (p. lxxxvi); "Acceni" for *Accenni* (p. xcvii); "girdi" for *gridi*, and "logge" for *loggie* (p. cxviii); "Volkes" for *Völker* (p. cxxii); "le Macon" for *le Maçon* (p. cxxiv). The list of Elizahethan translations and imitations of the several *novelle* (p. cxxiii), which Mr. Hutton takes over from Koeppel with only a "Cf." *pour tout remerciement*, is full of misprints and blunders, among which the prize falls easily to "Nacl geahunt of Whetstone." Unacquainted with this work, we turn to Koeppel's list, and find that "Nachgeahunt of" is meant as the English equivalent of *Nachgeahmt von!*

CURRENT FICTION.

The Bride of the Mistletoe. By James Lane Allen. New York: The Macmillan Co.

Serious effort is not so common among American writers of fiction as to deserve anything but respectful recognition when it actually manifests itself. There is no doubt about the seriousness of James Lane Allen's intent. He clearly looks upon his function as prophetic. His utterances, which are few, come forth with a measured and oracular air. His last novel appeared three years ago, and the present story, which is, he says, not a novel, only partly expresses a theme upon which we are to suppose him to have been pondering during the interval of silence. This theme is the American home, its sanctity and its perils.

We have had occasion before now to call attention to the "sentimental voluptuousness," the gauze-veiled eroticism, which has given its peculiar note, and lure, to Mr. Allen's work. There is a touch of unwholesomeness in the particularity with which he is wont to appeal to the lust of the fancy. He will not let us think of an attractive woman without hearing constantly in mind the existence of a body under her clothes. He deals not in the nude, but in the provocatively draped; his imagination finds something too ravishingly improper in the idea of nakedness. Sterne had the same kind of fancy, but redeemed or half-redeemed it by humor, of which Mr. Allen has not a gleam. And in this day of the world, humor or no, the Peeping Tom method must be considered as pretty definitely relegated to the "Amusement Parlors" and their literary equivalents. Mr. Allen's code is of the age when ladies walked with limbs, and men wore inexpressibles. No seriousness of intent can greatly avail Mr. Allen as long as this taint remains. When are we to have done with this harping upon the physiology of marriage? Here is a story of a healthy, natural man who, after ten years of happy marriage, has become less ardent in his billing and cooing than at first. The wife has wished him to be always the same, and at last is goaded to charge him with the horrid fault of having changed in his feeling for her. He does not deny the charge—as what honest husband, or wife, could? She suggests, rather grossly, that he would probably be rather glad if she were to make room for a successor. He does not deny this, and the wife is hysterical. This sufficiently simple theme is embroidered with much fanciful and pompous imagery; we do not quite see what it all amounts to. There is everywhere the suggestion of strain and effort. The writer is evidently determined to do a big thing. How self-consciously he works is suggested by the motto he chooses from Maupassant: "Il faut trouver aux choses une signification qui n'a pas été encore découverte et tâcher de l'exprimer d'une façon personelle."

Mr. Allen has his own manner, but his new meaning is not made clear by way of it. However, we are to have a sequel shortly, dealing with the same characters and their children; and "a third work, not fiction," presenting an interpretation of the Christmas Tree. "These three works," says Mr. Allen, "will serve to complete each other, and they complete a cycle of the theme." We may well wish that the writer's faith in the dignity of his work may be justified.

The Little Gods. By Rowland Thomas. Boston: Little, Brown, & Co.

It is a precious gift of youth that it can imitate boldly, innocently, and, often, quite successfully. Kipling to-day is not the literary idol he was five years ago; hut if Mr. Thomas had been set the task of writing a volume of Kipling stories, we cannot imagine how he could have turned out anything better than the collection he now offers us. The resemblance begins in the title of the book and continues through the pseudomystic prologue and the succession of episodes down to minute details of phraseology. The general theme helps out the parallel with Kipling, if, indeed, it did not suggest it. For Mr. Thomas's stories are of life in the Philippines, and from Manila to Mandalay is but a stone's throw. The strut of Kipling's Englishman, benevolent despot over millions of abject, inferior Hindus, is minutely reproduced in the strut of the lordly American among a million inferior Filipinos. There are three infantrymen in Mr. Thomas's book who are no other than our old friends Mulvaney, Otheris, and Learoyd. There is insistence on the gulf that separates East from West and on the danger of mixing white blood with dark.

Exorcise the ghosts of the past, and Mr. Thomas's volume stands out as a collection of clever and charming stories. They are told with artful directness. There is enough "go" in them to satisfy the most impatient temperament, and yet they do not drag the poor reader along by the scruff of the neck. The book has fancy, pathos, and humor; the last of a very abundant and uncloying kind. We like very much the vagahond gambler who impressed the natives by calling himself El Duque de la Calle Milochentaitres in America—the Duke of 1083d Street.

Daughters of the Rich. By Edgar Saltus. New York: Mitchell Kennerley.

It is to be assumed that the witting and voluntary reading of Mr. Saltus excludes one for the time from the category of "the Young Person," and consequently one opens his pages in the full expectation of finding a simple domestic hearth-brush called a muck-rake; but though we take up this book with our sensibilities steeled to immorality, its puerility shocks us grievously. It is strange that a practised hand like that of Mr. Saltus should have released to any mark but the waste-basket a thing that suggests, both in tone and style, a muddy-minded schoolboy's first attempts to imitate De Maupassant. As a piece of unintentional humor, it has some merit, a fact which is patent in the climactic speech of the orange-haired heroine as she casts herself into the hero's arms: "What girl would refuse a man who loved her enough to kill another woman for her? Dearest, I adore you!" This pretty ending is, fitly enough, the gem of the tale.

Mr. Opp. By Alice Hegan Rice. New York: The Century Co.

The hero of Mrs. Rice's latest book is by no means so exhilarating a character as Mrs. Wiggs, optimist of the cabbage-patch. The story of his life is set in the humorous-pathetic key, and is spun out perhaps a third longer than was necessary. As a result the reading becomes a little dreary before it becomes really interesting. Yet Mr. Opp is a very human being, and distinctly one of us. Vulgar in speech, mind, and manners, he has a heart full of smothered sentiment and struggling half-instinctive idealism. He says "ain't," wears a big seal ring on his forefinger, and

utters bombast; but he is ruinously honest in business, is a faithful dog in love, and heroically devoted to his insane sister. Energetic but almost stupid, he fails in everything he undertakes—as book-agent, as shoe salesman, as editor of a village paper—and yet with the expansiveness of a Micawber and a kind of touching, child-like invincibility, he looks out from his sordid present into an ever-auroral future. One cannot have an honest laugh at the poor fellow in the entire course of his history; for every time he falls into an outwardly ludicrous situation, one knows that his soft heart is bleeding. Upon the last scene of his unquestioning self-sacrifice comedy must drop a tear. Mr. Opp is a hero worth knowing; he bears with more than common fortitude the common lot.

Studies and Notes Supplementary to Stubbs's Constitutional History Down to the Great Charter. By Charles Petit-Dutaillis; translated by W. E. Rhodes. Pp. xiv+152. Manchester: At the University Press.

One of the reproaches most often cast at latter-day British historical scholarship, is its frequent failure to keep abreast of recent publications. In no way is this fault more annoyingly evident that in the absence of improvements in successive editions of standard books. The task of revising and supplementing the work of earlier years in the light of recent monographs and periodical literature is doubtless tedious and uninspiring, but it is also unavoidable; if the author does not do it, the student must.

Stubbs's "Constitutional History" has for many years been a case in point. Edition after edition has appeared, without extensive revision or improvement, until the work, though still indispensable as a whole, has in numerous important particulars become entirely out of date. Meantime, its value as a foundation for all study of English constitutional history in the middle ages has become thoroughly recognized on the Continent, in France as well as in Germany; and a few years ago a French translation was undertaken by Prof. Petit-Dutaillis of the University of Lille (now rector of that of Grenoble), whose "Étude sur le règne de Louis VIII," and elaborate introduction to André Réville's treatise on the Peasants' Revolt of 1381 have already indicated an intimate and scholarly acquaintance with this field. But the Frenchman did not merely restrict himself to translation. When, in 1907, the first volume of his edition appeared, it was found that he had added over 130 closely-printed pages of supplement and correction, incorporating in the original the results of the researches of Fustel de Coulanges, Meitzen, Maitland, Seebohm, Round, and upwards of a score of other lesser lights, and thus bringing Stubbs's work for the first time really up to date. The present book is a careful and accurate English translation of these additional pages, published for the first time as a separate volume.

The work comprises twelve studies, varying in length from two to twenty-eight pages. The first five fall within the Anglo-Saxon period, the sixth and seventh within Anglo-Norman, the last five within that of the three first Plantagenets. The three most important essays deal with the Origin of the Manor (an admirable survey of one of the oldest of controversies), the Origin of the Exchequer, and the Great Charter. They are, for the most part, based on the work of others, but towards the last, when dealing with a field in which he is himself a recognized authority, Prof. Petit-Dutaillis frequently presents his own views. Lucidity, precision, and common-sense characterize every page. A few passages from the concluding paragraph on the "Reasons of the Constitutional Importance of the Great Charter" may well be cited as an example:

> The importance of the Great Charter is in reality due to its fulness, its comprehensiveness, to the variety of problems which it attempts to solve. It does not differ fundamentally from the charters of liberties which preceded it in the twelfth century. . . . Finally, it was the result of a celebrated crisis. The aristocracy in arms wrested it by main force from a prince as redoubtable by his intelligence as by his vices, and its publication was followed by a terrible civil war, which ended in its solemn confirmation. It thus became a symbol of successful struggle against royal tyranny; men have discovered in it, in the course of centuries, all sorts of principles of which its authors had not the least notion, and have made of it the "Bible of the Constitution." There is no need to seek elsewhere the causes of its success in the middle ages and of its long popularity in modern times.

Surely, these are golden words. Certainly one could ask for no better answer to the endless stream of sentimental twaddle which the mere mention of Magna Carta usually evokes to-day. And it is difficult to see how any one but a Frenchman, untinged by patriotic prepossessions, could have made it with such good grace.

A History of Canada, 1763-1812. By Sir C. P. Lucas, K.C.M.G., C.B. New York: Henry Frowde. $4.15.

The Making of Canada. By A. G. Bradley. New York: E. P. Dutton and $3 net.

Canada has never lacked historians of her own, from Lescarbot and Charlevoix (if one may count them Canadians) to Kingsford and Bourinot. Yet she is indebted to American and English historians for some of the most effective narratives of her past. It is not surprising that American historians of Canada should have selected the French régime as the field of their studies. Being for the most part New Englanders —notably Parkman, Winsor, and Fiske —they were more interested in that part of Canadian history that touched the development of New England at so many points, than in the more remote, or less intimate, incidents of the English epoch. It is equally natural that English historians should devote their attention to the period of British rule, with its innumerable links between the old land and the new, and its intensely interesting experiments in British colonial policy.

English scholars who have turned to Canadian history can count no Parkman among their number; it is, indeed, not likely that just such a genius will ever again write on the subject. Yet it must be gratifying to Canadians, as it is to all who have at heart the writing of true history, that English writers of the stamp of Sir C. P. Lucas and Mr. Arthur Bradley should have given time and thought to the interpretation of Canadian problems. Differing somewhat in their point of view and treatment, both these writers seem to have planned their work along the same broad lines laid down by Francis Parkman. With inevitable limitations, they are each doing for the English period of Canadian history what he did so surpassingly well for the French régime—dividing it into fairly well-defined epochs, and treating each of these in a separate volume. Mr. Bradley had already covered the brief but stirring period of the conquest in his "Fight with France for North America"; and had told the story of contemporary life in his "Canada in the Twentieth Century." In the present volume, "The Making of Canada," he takes up the period of transition, the half-century following the conquest, from 1763 to and including the War of 1812. Similarly, Sir C. P. Lucas had devoted a volume to the "Canadian War of 1812," and now, in his "History of Canada, 1763-1812," goes back to the preceding epoch. As a matter of fact, the two volumes before us cover almost the same ground, the principal difference being that Mr. Bradley deals briefly here with the War of 1812, which Sir C. P. Lucas had handled more fully in his previous book.

A comparison of the two works reveals to some extent the differences in matter and manner of the writers. Mr. Bradley's appeal is to the general reader. His book is always readable, but scarcely profound. It is in effect a popular account of the three principal events that belong to this particular period: Montgomery's invasion of Canada and siege of Quebec; the coming of the Loyalists; and the War of 1812.

There is ample room here for effective writing, and Mr. Bradley makes good use of his opportunities. The chief merit of his book is that it brings together in one volume, and in attractive form, material that is elsewhere available only in elaborate treatises, or, on the other hand, in the crowded pages of a general history. It cannot be said, however, that he succeeds in throwing much new light on this portion of Canadian history, nor does he seem to have made any particular use of the wealth of documentary material that has recently been discovered through the efforts of the Dominion Archivist. It is, in fact, just here that Sir C. P. Lucas's work is most clearly distinguishable from that of Mr. Bradley. It will never have the same wide appeal, but to the serious student it will possess a value that the other lacks. Sir C. P. Lucas's book is not so much a narrative of Canadian history as an analysis, exceedingly acute and scholarly, of the causes and consequences of certain events that mark the period. As his "Canadian War of 1812" was based upon such hitherto untouched material as Cruikshank's "Documentary History of the War of 1812," and the manuscript records in the Canadian Archives; so in the present work he has made effective use of the splendid collection of material brought together in Shortt and Doughty's "Documents relating to the Constitutional History of Canada," and Egerton and Biggar's "Canadian Constitutional Development." His work is therefore sharply defined from all previous attempts to write the history of this period; it corrects a number of errors into which previous historians had been led, because they lacked the original documents now available; and it forms, with the "Canadian War of 1812," the best available history of Canada from 1763 to 1815. It is much to be hoped that Sir C. P. Lucas will continue his researches and give us in time a complete series of monographs covering the whole period of British rule.

Science.

Cyclopedia of American Agriculture: A Popular Survey of Agricultural Conditions, Practices, and Ideals in the United States and Canada. Edited by L. H. Bailey. With 100 full-page plates and more than 2,000 illustrations in the text. Vol. I: Farms. Vol. II: Crops. Vol. III: Animals. Vol IV: Farm and Community. New York: The Macmillan Co. $20.

The completion of Bailey's "Cyclopedia of American Agriculture" has for the first time brought within reach of the general reader a comprehensive digest of the agricultural literature which has been poured forth in baffling abundance by experiment stations, colleges, societies, and governmental departments. In the multitude of their counsellors the farmers have found confusion rather than wisdom. In the bulletins, reports, and farm journals, what is new and important is buried in a mass of repetitions and irrelevant detail. That the enormous sums donated by the Federal government and the States for the promotion of agriculture have paid on the whole, is undeniable, but it is also undeniable that a considerable part of this expenditure has been wasted in incompetent and misdirected experimentation and unwarranted publication.

Prof. Liberty H. Bailey was eminently qualified to sift this literature and present its best results in popular form; for the Cornell Experiment Station, under his direction, has been a pioneer in the task of educating the people in agricultural science by means of attractive and practical bulletins. His "Cyclopedia of American Horticulture," in four volumes, is the model followed by the present work. He has enlisted as collaborators and contributors most of the men prominent in agricultural investigation in this country, several hundred names being credited with assistance in various capacities. As the articles are signed, the reader is enabled to judge for himself of their authority, and also, where he knows the attitude of the authors on disputed questions, to make allowance for the personal equation. There is, of course, a great diversity of style, and not a little divergence of view, but the planning and editing have been managed so that the different articles fit together well, and there is not an undue amount of repetition. The arrangement is, for the most part, topical, so that the volumes can be read continuously or used for reference by aid of the index. The pictures are really illustrations, mostly small line-drawings inserted in the text, with occasional pages of half-tones. Some of the pictures of both kinds are obviously superfluous, but the proportion of such is smaller than usual in works of this class.

The first volume deals with the elements, in the primitive meaning of the word, with earth, air, and water. But in spite of its elementary nature, it covers an area of much ignorance; for the immense amount of study that has been given to soil in recent years has shown how very complex and mysterious a thing it is, and the weather, on the study of which even more money has been spent, is still largely unpredictable and altogether uncontrollable. The second volume deals with the crops of the farm: their varieties, characteristics, cultivation, protection from diseases and enemies, methods of marketing, etc., each plant or group of plants being discussed in a section by itself. There is a general introduction on vegetable life, explaining the botanical terms used; and the following volume, devoted to farm animals, has a similar chapter on physiology. Stock feeding, dairying, and animal breeding have also special chapters in this volume.

But the farmer himself is not forgotten. The fourth volume, recently published, is devoted to him, and to his wife and children. It must have offered the greatest difficulty to the editors, and it is not to their discredit to say that this volume does not equal the others in compactness, arrangement, and completeness. In dealing with the animal and vegetable products of the farm, the editors were following smooth-beaten roads, but in this they were on new ground. Physics, botany, and geology are well developed sciences, but sociology, especially farm sociology, is in an immature state. Volume IV, however, contains more that one cannot find elsewhere, even though it does not contain all that one would like to find in it. A chapter on the history of American agriculture from aboriginal times opens the book, and a collection of brief biographies of the men who have taken a prominent part in the making of that history forms its close. A great deal of space is given to the scope and work of the agricultural colleges and to other forms of education and research. The national and State laws relating to pure foods, animal inspection, the sale of fertilizers, the control of the forests, and the preservation of game are summarized and discussed. There are more "live wires" in this volume than in any other, even the one on animal-breeding; but they are handled deftly. Coöperation among farmers for marketing or purchasing; abandoned farms and their meaning; the policy of forest preservation; the influence of machinery; tenantry; mortgages; the drift city-ward; the country church; the Grange and the Farmers' Alliance; mutual fire insurance and telephone companies; roads and canals—such questions as these, the discussion of which is usually tinged with emotion, are here treated with fairness, although not always with thoroughness. Among chapters conspicuously absent is one on the effect of the tariff on the farmer. One of the most valuable chapters of this volume, because it deals with a question of vital importance to the arid West, is that on irrigation policies, which gives an account of the long struggle for the overthrow of the old common-law doctrine of riparian rights. This struggle has involved as many lives and fortunes as some historic wars, yet its significance has not been understood outside of the regions practically concerned. According to common law, water taken from a stream must be returned to it undiminished in quantity and unaltered in quality; but this

would, of course, prevent irrigation altogether, so that there has been an evolution of legal opinion in the irrigated States to the view that the water, like other property, may belong to individuals, and, finally, that it should belong to the State. This is only one instance among many that might be cited of topics here treated which are of general interest but not elsewhere accessible to the general reader. For the "Cyclopedia of American Agriculture" is not a work for the college library alone. Any intelligent farmer will find it a profitable investment, and it will be of service to all who have occasion to look up information on commercial, sociological, or scientific subjects connected with agriculture.

After looking over the last volume we regret that Congress, which is usually so lavish in the publication of agricultural documents, should not have found it possible to give to the people the report on the conditions of farm life prepared by President Roosevelt's commission, of which Professor Bailey was a member.

"Consumption, Its Prevention and Cure," by Dr. C. H. S. Davis (New York: E. B. Treat & Co.), is the enlarged second edition of a work, with slightly different title, which appears to have found its public. It is a small book, just over two hundred pages, giving a popular account of the disease and its treatment, particular stress being laid on the relative futility of drugging and the importance of dietetic and hygienic measures. Three appendices give lists of sanatoria, brief and uncertain tables of the composition of some foods, and a discussion of diets which is not always judicious.

A monthly list of the published maps and charts of all parts of the world is now to be found in Petermann's *Mitteilungen*. The April number contains in addition a useful index chart in eleven sections, showing the location and character, as topographic, geologic, statistical, and oceanic, of the publications of the first three months of this year.

Albert P. Watson, who drove the first bolt in the ironclad Monitor, and for some years was on the editorial staff of the *Scientific American*, died at his home in Elizabeth, N. J., June 22, at the age of seventy-four. Mr. Watson founded the *Mechanical Engineer* in 1881, and he continued its publication for sixteen years. He was one of the founders of the Republican party in New York, stumping the State for Fremont and Dayton.

Drama and Music.

A NATIONAL THEATRE FOR SPAIN.

National theatres appear to be the order of the day. England is struggling for one, and though our own latest project in this city calls itself only New, its promoters hope that it may one day be spelled National. In Spain, they order these things differently: private enterprise waits on government action. If a Spanish National Theatre cannot be created, as was the French, by a Moscow decree, it at least requires initiative by the Cortes. This has already been had. Each house of the Spanish Parliament has passed a bill of its own to establish a National Theatre, but the two measures were unlike, and a mixed commission—officials, actors, literary men, Galdós among the last—has been appointed to harmonize their differences. A statute of eleven articles has now been agreed upon, and promises to become the charter of the new theatrical institution in Spain.

The project calls, in the first place, for a competition among Spanish architects to secure the best plans for the new building, alongside which is to stand a conservatory for the training of actors. A society of actors is to be organized, whose rights and dignities will be secure. They are to give theatrical productions in Madrid for at least six months each year, and their repertory is to consist mainly of Spanish classics, with the best of contemporary plays written in the Peninsula, foreign dramas to be given only sparingly. One provision is that, during the dramatic off-season, the National Theatre may be used to produce works in any language spoken in Spain. This looks directly to the Catalan theatre, in which there has been so much interest of recent years. Whenever a vacancy occurs in the national society of actors, the place is to be filled by competitive tests. At the head of the whole organization will stand a director appointed by the government. In that stipulation lies an obvious danger. A mere bureau chief at the head of the National Theatre might have the fatal effect of making it "official" in the worst sense of the word.

In this whole scheme we have, plainly, no attempt to make bricks without straw. In Spain, they are not deluded by the money-fallacy. They know that, to produce a National Theatre, they must have a supply of highly trained and versatile actors, together with skilled and successful playwrights. In both these items, Spaniards can point to a long and honorable tradition. It is needless to dwell upon the glories and the influence of Spanish dramatic literature. That is a commonplace with the literary historians. But the supply of living drama has not given out. There has been a distinct revival within the past thirty years. When G. H. Lewes wrote of the Spanish theatre in 1867, he found it in a period of decadence; yet even then he was forced to admire the sound and fine tradition of Spanish acting. But a renaissance in Spanish playwriting soon followed. Without the achievements of such dramatists as Ayala, Tamayo y Baus, Galdós, and, above all, Echegaray, we may be sure that the impetus to found a National Theatre would have been wanting.

The Spanish stage has always had more inherent merit than outward recognition. Cervantes's own description of the scanty outfit of actors in his day, and of the cheap settings of the theatre, is to be found in one of his prologues:

> The whole apparatus of an *autor* [at once writer, actor, and manager] was contained in a sack, and consisted of four white sheep-skins trimmed with gilt leather, together with four false beards and wigs, and four walking-sticks, more or less. . . . The stage itself was composed of four benches, forming a square, with four or six planks placed upon them. The back scene consisted of an old blanket which could be pulled by cords to one side or the other.

It is said that a modern Spanish theatre in Madrid—either the Español or the Real—stands to-day upon the very site where Lope de Rueda used to entrance the public from such a rude stage as that described by Cervantes. The play was the thing—and the actor—not rich costumes and elaborate scenery. To support the latter, an appeal has often to be made to the luxurious classes, whose demands do not make for the best development of native talent. Thus in the Teatro Real at Madrid to-day, which could not live upon its small government subvention without the patronage of fashionable society, the reigning taste has compelled the production of a vast amount of Italian opera and foreign drama. It is expected that the new National Theatre will change all that.

We do not know that the Spanish stage boasts to-day any actors of supereminent fame, but it possesses a large body of performers fitted by long and arduous training in their art to undertake the exacting labors of a repertory theatre. Lewes pointed out that the national taste in the matter of acting was "healthy." This being so, any exceptional talent that might present itself would find the arena ready for it. On the Spanish stage one does not see coarse buffoonery or ranting violence. A demonstrative and gesticulating race lays a greater restraint upon its actors than do the colder English. The fun made by a Spanish comedian comes from words and looks, not from bizarre dress and facial distortions. Turbulent exaggeration is never shown by the Spanish players who are able to assume a hundred rôles. They speak, not mouth. And if their method may be sneered at as the "drawing-room style," that may at least be preferred to the "barn style." All told, therefore, the experiment of a Spanish National Theatre, involving the preliminary existence of competent actors and an abundant supply of plays, may furnish one proof more of what a "dying nation" has to teach its complacent patronizers in matters of art.

With excellent judgment the second play chosen to be acted in the Harvard Stadium was Schiller's "Die Jungfrau von Orleans," and for its performance on Tuesday evening of last week the place was transformed into the battlefields of France. The event was for the benefit of the Germanic Museum of Harvard University, and the participants were Miss Maude Adams and a company of players selected from the diverse forces at the command of Charles Frohman. It was given in the English version of Miss Anna Swanwick, with additions and alterations by George Sylvester Viereck. It was more of a pageant than a play, more of a spectacle than a dramatic performance, a thousand supernumerary players having been chosen and drilled to take part in the battle scenes and the other events. Some of these were trained riders, skilled in cavalry exercises, some were selected to form the soldiery and bowmen of the armies of France and England, while others represented the French peasantry of the fifteenth century. Enormous searchlights gave a night as brilliant as day, and the sky roofed in the Stadium in a manner that made perfect the illusion of a vast enclosed space. The entrances and the exits of the players, principals and supernumeraries, were not merely from behind the stage-settings, but as well from openings that pierced the lower wall of buttressed stone steps upon which sat the audience. In this way advance and retreat of vast crowds were accomplished in almost the twinkling of an eye. Miss Adams, in the rôle of Joan of Arc, was no vigorous peasant girl, such as the real Joan of Arc may have been. She was Schiller's Joan of Arc, a fragile, spiritual maiden sent by Heaven to free her country and enthrone her king. It was evident that her mission was a miraculous one, that she herself was a miraculous figure dominated by human instincts. So much was due to Miss Adams's personality. Her voice carried throughout the full extent of the amphitheatre, and with the assistance of her companions, she made the play audibly as well as visually understandable. Singularly enough, although "Die Jungfrau von Orleans" is one of the most famous of Schiller's plays, it has never before, so far as recollection and records serve, been performed in English in this country.

Not only violins, but concert halls and opera houses improve with age. When the Metropolitan Opera House in New York was first opened, the acoustics were certainly less good than they are now, though they still leave much to be desired. The director of the Paris Opéra, M. Gailhard, made the remarkable discovery that a tuning fork which could be heard distinctly when the auditorium was darkened became inaudible when the lights were turned on. Does this speak in favor of the plan of giving concerts in a darkened hall and the Wagnerian habit of turning down the lights? The ancients seem to have known some acoustic secrets that are now lost. The theatre of Tauremonium, for instance, had seats for 30,000 spectators, yet the actors could be heard distinctly by all.

For the second time the Czar has allowed his Imperial ballet to visit Berlin. Ballet dancing has not been much in favor in the German metropolis of late years; it has shared the fate of the old-fashioned operas with which it was chiefly associated. But this Russian ballet is a very different thing from the usual operatic tiptoe dancing. The girls and youths engaged for it have to go through a severe course of training, lasting several years. They are taught a rhythmic precision of which ordinary dancers have not the remotest conception; they pay attention to the slightest accents in the music; the least member of the corps does things that one ordinarily expects only of famous solo dancers. Ballet dancing like this has never been seen in America.

Isidore de Lara has written another opera, called "Solea," which was recently performed for the first time, in Paris. The libretto is by Jean Richepin, and the story, laid in the middle ages, is that of a gypsy girl who falls in love with a Christian knight.

The Mozart festival at Munich this summer (July 31 to August 8) will consist of six performances, under Felix Mottl. "Don Giovanni" and "Figaro" will be given twice each. "The Abduction from the Harem" once, and "Cosi fan tutte" once.

The principal musical and social event of the last musical *temporada* in Buenos Ayres was the opening of the new Colon Opera House. It has a larger stage than any other theatre in the world, and room for 3,000 spectators. Good seats are provided for those who cannot pay the highest prices, and the auditorium is constructed on such broad lines that none of the seats are too far away from the stage. The opening opera was "Aïda," under Mancinelli. Among the other works produced was a new opera, "Aurora," by the Argentine composer, Hector Ganizza, written specially for the occasion at the request of the government. The music is in the Italian style, and there are said to be some effective numbers.

Lucien-Joseph-Edouard Hillemacher, the composer, has died in Paris at the age of forty-nine. He was educated at the Paris Conservatoire, and in 1880 won the Prix de Rome and two years later the Prix de la Ville de Paris. His operas are: "Loreley," "Saint Mégrin," "Une Aventure d'Arlequin," "Le Drac," "Orsola," and "Circé."

Recueil de Monuments Egyptiens. By Jean Capart. 1ère et 2ème séries. Brussels: Vromant & Cie.

Une Rue de Tombeaux à Saqqarah. By Jean Capart. 2 vols. Brussels: Vromont & Cie.

Our knowledge of the amazing fecundity and our respect for the exquisite taste of the Egyptian artist-craftsmen are constantly increased by the excavations of Theodore M. Davis in the valley of the Kings' Tombs at Thebes. His latest volume presents the discoveries in three important new tombs, besides that of the already known tomb of Mentuherkhepshef. The new tomb of King Siphtah reveals chiefly a number of wall paintings of surprising beauty for this decadent age at the close of the nineteenth dynasty. In an adjacent sepulchre, far below the level of the freshets in the valley, and covered with the mud carried in by the waters, where most excavators would have abandoned the work in a tomb evidently unfinished and unused, the excavations disclosed embedded in the mud a magnificent set of regalia in gold and silver, once worn by Queen Tewosret at the close of the nineteenth dynasty toward the end of the thirteenth century before Christ. It would be impossible even to catalogue these superb ornaments in the space at our disposal. Besides two sumptuous and complex golden ear-ornaments, which are too large and elaborate to be termed pendants or ear-rings, there are a pair of silver bracelets and eight splendid gold finger-rings bearing the names of Seti II, Queen Tewosret, and Ramses II. These rings were found by Mr. Davis in silver gloves or hand-coverings which had evidently once covered the hands of Queen Tewosret in death. A golden diadem of the queen is built up of a series of rosette-like flowers, distributed along a gold band, recalling the tiara on the statue of the Princess Nofret in Cairo. A superb necklace of spherical openwork beads, each bead built up of a series of tiny tangent wire circles, exhibits taste and workmanship of which any modern goldsmith might be proud. The sumptuous form in which they are published always makes the discoveries at Mr. Davis's excavations of especial value to students of art and archæology.

Ludwig Borchardt has given us more than one important discovery in the art of Egypt, the most notable being the complete reconstruction of an original pyramid-complex on the basis of his recent excavations at Abusir. Many good people still look upon the Great Pyramid as a ruined granary of Joseph, or a repository for standards of weights and measures, or an epitome of the

world's history, past and yet to come, or even an exposition of the fundamental laws of the mechanics of the universe. The books of Seiss and Piazzi Smith are very far from having lost their influence among us. Borchardt's excavations, however, have made it possible to reconstruct with great accuracy the splendid and imposing complex which formed the tomb of Pharaoh. The shining pyramid in spotless limestone crowned the desert cliff above, while on its eastern side, facing the rising sun, rose a massive temple where the mortuary ritual of the departed Pharaoh was unceasingly carried on, supported by an endowment left by the king on his death. This group of pyramid and mortuary temple on the margin of the desert-plateau was reached from below by a long covered causeway of limestone, which dropped by slow descent from the desert to the lower alluvial plain, on the margin of which the causeway terminated within the walls of the royal city. Here the townward entrance to the causeway was adorned with a magnificent monumental portal, a colonnaded porticus. The colonnades found by Borchardt in these buildings supplementary to the pyramid are the earliest yet discovered in the history of architecture. They demonstrate beyond a doubt that the origin of the colonnade belongs to Egypt, and effectually dispose of another of the preposterous claims of the Pan-Babylonians, who would derive everything in the ancient world from Babylonia. Borchardt's elaborate publication of these results will long remain the standard of excellence to be attained in the presentation of such materials.

Many visitors in Cairo, spending never-to-be-forgotten days in the Museum there, or wandering among the shops and bazars, look in vain for satisfactory reproductions of the monuments, especially the sculpture and other works of art in the great national collection. It is a common remark that the Museum at Cairo is the most wonderful collection of the works of early man in existence. An adequate publication of its most notable treasures is, therefore, to be greatly welcomed. Herr Borchardt has made a careful selection of the leading objects, the reproductions are well done by a photographic process, and a sufficient text has been added to make the subjects intelligble. The volumes should be in every library and art museum.

One of the great difficulties in the presentation of Oriental art in the classroom has been the lack of graphic materials. This want will be largely met by M. Capart's excellent selection of Egyptian sculpture presented in his "Recueil." The plates are the best that modern mechanical processes can produce; the text is carefully done, and has assembled the necessary bibliography concerned.

In his "Rue de Tombeaux" M. Capart also gives us the interesting reliefs in an entire series of Old Kingdom tombs disclosed in the excavations of Loret. The series is of unusual importance, perhaps the most notable among them being the representation of a surgical operation some 4,500 years ago. The victim, or patient, who is undergoing the ordeal of circumcision, is held by the surgeon's assistant. The surgeon's words of caution to the latter, not to let the patient move, are recorded over the scene. These reliefs are also important in furnishing examples of the two schools of Egyptian sculpture, which as in the Italian renaissance are so evident; the one depicting its subjects in a distant, formal, official and conventional manner; the other preferring an intimate, personal, informal and unconventional style, much more warm and human. Both these works of M. Capart are indispensable to the art library.

An exceptionally fine villa has been discovered on private land within 600 feet of the point in Pompeii where the government is now working. It contains several rooms decorated with great elegance, and a large triclinium in the best Pompeian style. On the walls of this triclinium are a number of figures a little less than life-size, admirably done. One group represents Silenus offering a drink to a man who bends before him and eagerly presses the cup to his lips. On another wall a figure stands before a prone female figure, possibly an Ariadne, but this fresco is damaged. On the third wall, a large winged Victory appears striking a female figure, who tries to avoid her blows, while a third kneels, praying to the goddess to pardon the guilty one; and a fourth, standing behind, urges her on with clashing cymbals. The expression of these figures, the brightness of the colors, and the truth and lightness of their movements, are said to be extraordinary. A rich cornice, containing a beautiful and original design of maskers, runs around this room.

Jacques Rosenthal of Munich announces as forthcoming an unusually interesting work for art students. It is entitled "Der Münchener Boccaccio: Reproduction der herrlichen, teilweise dem Jean Fouquet zugeschriebenen Miniaturen des berühmten Manuscripts der Kgl. Hof- und Staatsbibliothek zu München" (91 Miniaturen auf 28 Tafeln in Heliogravüre und ausführliche französische Erklärung), by Count Paul Durrieu, member of the Institut de France and Honorary Conservator of the Louvre. Of this fine work 300 copies will be issued on glued *Büttenpapier* at 100 marks per copy, and 25 copies on extra fine Japanese paper at 200 marks.

Lewis F. Day has recast his "Nature in Ornament," published in 1891, into two volumes, under the general title of "Nature and Ornament." The first volume, Nature the Raw Material of Design, is now published by B. T. Batsford, London (imported by Scribner), and is to be followed by "Ornament the Product of Nature." We have found the drawings of plants, mainly by Miss Foord, much more interesting than the text, which deals with generalities that are hardly glittering.

William Verplanck Birney, A.N.A., the painter of hunting scenes, died suddenly June 22 at Saratoga. He was born in Cincinnati in 1858. He studied in Boston under Walter Smith at the Massachusetts Normal Art School, in Philadelphia under Thomas Eakins at the Pennsylvania Academy, and at the Royal Academy, Munich, under Julius Benzur and Wilhelm Lindenschmidt. When he was twenty-six he opened a studio in New York, and he was for three years an instructor at the Cooper Institute.

William T. Trego, a portrait painter and sculptor, was found dead at his home in North Wales, June 24. He was fifty-one years old. One of his most popular pictures is "Rescue of the Colors," purchased by John Wanamaker, and presented to the Bucks County, Pa., Historical Society.

Finance.

MIDSUMMER MARKETS.

Writing on the French stock market, a well-known financial critic of Paris remarked, a couple of weeks ago:

The state of mind now prevalent on the Bourse gives cause for reflection. Every day a new and different stock is pushed up, and the attempt succeeds easily. Nobody asks what is the basis of the rise; that would look foolish. A stock advances because people said it was going to advance. The more absurd the movement seems, the more it impresses the speculative mind. Bears are transformed into bulls, yielding to a force which they deem all the more irresistible because they cannot imagine what is the cause of it. It is the savage worshipping fire. For let nobody deceive himself, the psychology of Stock Exchange speculation is still rudimentary.

But the Paris speculation halted as suddenly as it had begun, and, apparently, a midsummer apathy has spread over the speculative market. The same thing has occurred in London, where an excited speculation in South African mine shares lately raged. In New York, too, the market showed signs of coming weariness. This may have been

partly because promised news did not materialize. The French government intervened to obstruct the listing of United States Steel shares on the Paris Bourse—partly, it was reported, because of technical irregularities, but partly also because of the rather natural protest of the iron-masters of France against officially inviting French capital into the stock of a competitive foreign combination in the trade. The directors of the Reading Railroad, whose stock had risen 20 or 30 points on reports that the annual dividend would be increased from 4 to 6 per cent. per annum, held their semi-annual meeting and decided against an increase.

On top of all, the critical period of the crops approached, and eminent financiers—some of them identified in public rumor with the recent extravagant speculation—began to plan for their summer vacations. Wall Street then began to say that the dull midsummer season was at hand. It is true, the Stock Exchange did not at once give up its toys. Early last week, it reported Mr. Harriman's physical condition to be desperate, the Sugar Trust to be about to be dissolved by Federal suit, and the proposed corporation tax to be a menace of the first order to investment interests, and stocks broke 3 or 4 points. A few days later, Union Pacific preferred stock rose 7 points in two days, with "rumors" of a "coming deal," and fell 8 points when the rumors had had their effect, the general market moving with it. Yet nobody took either demonstration seriously. Midsummer dulness was actually here, despite the pretended activity on the Stock Exchange.

But will it last throughout midsummer? If hot weather, light business, and vacations are the causes of it, then such a result would seem logical enough. Yet they were quite as logical last year, and, in fact, July, 1908, began with Stock Exchange sales at the lowest level in a dozen years. The next week saw apathy suddenly thrown aside, and a vigorous speculation for the rise begun. Throughout the month the activity increased. In August, the rise continued buoyantly until well towards the close. During seven midsummer weeks, advances such as 19¾ points in Union Pacific, 14 in St. Paul, 18 in Amalgamated Copper, and 11¼ in Steel common occurred.

The summer of 1907 was also one of activity on the Stock Exchange, although in another direction. Prices fell rapidly under the pressure of forced liquidation which began in March and culminated in October. Union Pacific fell 21 points in July and August, St. Paul 16, Reading 18, Amalgamated Copper 14, and so on.

Of the summer of 1906, the story is well remembered. July was a month of comparative dulness until near its close, when there was an aggressive upward movement in prices. On the last day, resumption of the Steel Corporation's common dividend was announced, and the general advance was carried along with spirit. Then came August 17, with the famous announcement of the Harriman dividends, and all this time the Union Pacific treasury was secretly buying its $131,000,000 worth of stocks. The movement of the market thereafter is well known.

Is the summer of 1909 to make a fourth in this interesting series? We shall see evidences, one way or the other, before many weeks have passed.

The fourth edition of Charles A. Conant's "History of Modern Banks of Issue" (Putnams) is a revision of a valuable work, first published in 1896, and now brought up to the end of 1908. The new edition contains 142 additional pages, partly made up of a much more elaborate discussion of banking and exchange in the Orient, partly of new matter in the other chapters, extending the historical narrative. Thus, the currency bills proposed in 1908 by Mr. Fowler and Senator Aldrich are fully discussed, and the operations of the Imperial Bank of Germany during the world-wide "money squeeze" of 1906, and of the Bank of Japan since the panic of 1907, round out the preceding narrative. It is somewhat to be regretted that Mr. Conant did not also treat more fully the recent policy of the Bank of England. The attitude of the governors of that institution, when the joint-stock banks lost their heads in 1906 over the financing of speculative Wall Street, and the history of that institution's reserve during the panicky recourse of New York to England's gold supply in the last months of 1907, have a highly interesting bearing on the bank's position in international finance. The book remains the most complete and serviceable authority on the general question of banks of issue; the bringing of the statistical tables up to date, in this edition, adds materially to its value.

BOOKS OF THE WEEK.

Catalogue of The Macomber Collection of Chinese Pottery. Compiled by John Getz. Boston: Museum of Fine Arts.

Dunn, Joseph. La Vie de Saint Patrice. Paris: H. Champion.

Eiloart, Arnold. No Rheumatism. London: A. C. Fifield.

English Prose. Selected by John Matthews Manly. Ginn & Co. $1.50.

The Nation.

NEW YORK, THURSDAY, JULY 8, 1909.

The Week.

The first glimmering ray of hope that has for many days broken upon a tariff-ridden public shone out in President Taft's brief but meaning reference to the tariff in his speech to the Yale alumni. If Aldrich is insensible to the ground-swell of general irritation, Mr. Taft is not. The Chief Executive realizes that the only political responsibility we have evolved in this country is that of the dominant party to the electorate, as construed in the platform pledges. Relegation to the rôle of the minority in opposition is the menace which confronts the cynical violation of political vows. Mr. Taft, it is evident, realizes that the country will hold the Republican party to a strict accountability in this matter. The resentment is not less, but greater, in that the Democrats have shamelessly failed in their obligations to fight the "Dingleyizing" of the House bill. This will eventually make powerfully for a split in the Republican ranks, and not impossibly for new party alignments altogether, unless the President can bring to bear on his party his own sober counsels of decency and honor.

It appears now that the tax on corporation incomes was not devised simply to help the chairman of the Finance Committee out of a hole, but was drafted by the Attorney-General shortly after his appointment. When the House leaders chose to substitute an inheritance tax, the President apparently decided to lie low and wait for his chance. This came in the determination of a Senate majority to graft an income tax upon the tariff bill. Aldrich protested, and when he fled for help to the President, Mr. Taft smilingly produced the corporation tax. Vowing he "would ne'er consent"—or never for more than two years' duration of such a measure—Mr. Aldrich finally "consented." He had even the humiliation of having to swallow his proposed time-limitation, though he files his personal caveat at this feature of the measure. Meantime, Mr. Taft's pointed reference to tariff reduction at New Haven seems to have produced consternation at Washington. Members of Congress regard it as an "ultimatum." They have anxiously rushed to inquire if he really said it, and if it has any political significance. The Washington dispatches report that the query "amused Mr. Taft greatly." There has been a rush of blood to the heads of Congressmen since they were answered genially by the President "to use their own intelligence on that subject."

The list of Independence Day casualties will probably need revision for some time to come. Fuller information may raise the number of the injured. The usual proportion of injuries will go to swell the number of the dead. It remains certain, nevertheless, that the last holiday marked a notable advance towards a sane, if not a quiet, Fourth. This year the country was vouchsafed two days' opportunity for self-destruction instead of one; the sharp decrease in fatalities indicates growing recognition of the truth that people need not sacrifice life in celebrating liberty and the pursuit of happiness. Washington and Cleveland report a noiseless holiday; in Chicago the ban was laid on the giant firecracker and the toy cannon. Many towns restricted the sale of holiday explosives to a few days before Independence Day. Unless the powder manufacturers and the doctors get together and have Aldrich rig up some sort of protection for their threatened interests, it really seems as if future holidays will demonstrate the complete compatibility of freedom and common sense.

In line with the recent declaration of the Merchant Marine League, in favor of free ships, is an article in the July *Atlantic*, "Wanted: An American Merchant Marine." Strangely enough, it is written by a British naval officer. He identifies himself no further than by saying that he is "second officer on a Liverpool liner." In common with the seafaring folk of all countries, he is amazed at the supineness of Americans in letting other nations do practically all their ocean-carrying for them. A chief reason for our marine backwardness he finds in the "insane law" which "makes it impossible for a ship whose keel was not laid down in America to fly the stars and stripes." Ah, but we ought to fear the foreigner even when he is bearing us the gift of good advice! How do we know that this British officer is not a secret agent of English shipbuilders, who want to get orders from the United States? In any case, he shows a deplorable ignorance of our noble policy of protection, when he suggests that we could build ships as cheaply as anybody else, if only our iron and steel manufacturers would sell for as low prices at home as they do abroad. That proves clearly that this benighted Englishman has not the faintest conception of the blessings of a high tariff which favors the foreigner at the expense of the native.

That an indictment should have been found, after all, against the Sugar Trust and its chief officers, suggests a contrast between the present Administration at Washington and a certain preceding Administration. In former days we grew accustomed to the loud threat against corporate iniquity, followed by the discovery that something or other had happened to make the wicked corporation immune. To-day, we have the refreshing spectacle of a government prosecution seemingly foundered on the old rock of the statute of limitations, but escaping the danger very cleverly and going right ahead. Counsel for the Sugar Trust have not been as successful as they thought they were in persuading the government's representatives that the Trust could not be prosecuted. The Department of Justice has found acts of criminality in connection with the Segal case that run back less than the magic three years which wipe out all things. It is a novelty to see Justice displaying something of the resourcefulness which we have hitherto associated entirely with its opponents.

The white firemen on the Georgia Railroad are quite ready to agree that, properly manipulated, arbitration is a very beautiful thing. If arbitration decides in your favor, why, there you are. But if judgment goes against you, then,

as members of a dominant race, you can draft a bill prohibiting negroes from working as railway firemen, and lay that bill before a Legislature which will think twice before it refuses to dance to the tune of the Dominant Race. The most elementary sense of what is just and permissible under the Constitution must be outraged by the latest shameless attempt to apply the educational test clause to the keeping down of the negro in the dirt where, according to Dominant Morality, he belongs. Are we soon to see the day when a man shall not be allowed to stoke an engine or turn a brake-wheel unless his grandfather was a freeman before 1867?

In his recent address to the Yale alumni, President Hadley discriminated between different fields of scientific research. He aptly characterized a certain kind of research as about the poorest business a man could engage in, and still retain the acknowledged status of a gentleman and scholar. Even the discovery of some things unknown before is not, of itself, sufficient to create any obligations on the part of the learned world to the discoverer. There are said, for example, to be known something like a million distinct varieties of living animals. A distinguished zoölogist has given it as his guess that there are probably still uncatalogued an additional million, mostly microscopic, however, and *not* confined to the continent of Africa. Merely to discover a single additional species would serve, of course, as the basis for the "ordinary Ph D. of commerce." But beyond that it would be of little worth. The serviceable investigator must possess at the outset, or acquire, an instinct for such knowledge as is worth while.

A Detroit clergyman, the Rev. Reed Stuart, has just resigned, after a pastorate of twenty-three years, because, as he explains, he does not feel "equal to the work of the institutional church." Without any bitterness, but in the most matter-of-fact way, he defines that sort of church as the one which "believes in free soup, in boys' clubs, and basketball, and in cadets carrying guns in the name of Christ." Those things, he admits, may be necessary in the modern church, but he intends from now on to leave the management of them to others. His early ideal had been that of a preacher, a spiritual leader; but he had found more and more of his time and strength taken up with the infinite variety of organizations within the church. We fancy that many a weary minister would find all this waking a response in his own heart. The institutional church does, no doubt, a world of good; but some of its activities are confessedly only a sort of pious bribe to induce people to occupy pews, and it certainly tends to belittle the prophetic function of the clergyman. What is really needed is a division of labor, by which those who have a talent for "serving tables," in the Scriptural phrase, may wreak themselves on the machinery of the boys' brigades, while those who feel a message burning in their souls may be left free to shape and deliver it.

The assassination in London of Lieut.-Col. Wyllie by a Hindu student is bound to produce a more painful impression in England than it could make in any other part of the world. England has so long been the home of public security that acts of violence take on a meaning often out of proportion to their importance. Englishmen have not known what revolt is for over two hundred years. They must go back to the Peterloo massacre—an event which even among us would be described as a riot—for an example of serious public disorder. When a couple of Russian anarchists went mad and ran amuck in Tottenham a few months ago, the country was driven to discuss the expediency of excluding foreign political refugees of a "dangerous" type. Hence such a cold-blooded act as this political murder cannot help creating a condition of public excitement which may in the end bring harm both to Great Britain and to the Hindus. Lord Morley may have to face a loud outcry for summary action in India. It will be his duty to judge just how much significance must be ascribed to the wanton act of the Hindu student and terrorist. India, as a whole, has accepted the political concessions recently granted her. It would be unfortunate if the work of conciliation should be hampered by the action of a fanatic or a lunatic.

If Professor Dicey and the editor of the London *Spectator* were among the onlookers in Parliament Square at the latest suffragette riot, we may be sure they kept well in the background. It was not only feminine brickbats, but their own words also, that they were afraid of having thrown into their faces. Professor Dicey, in a book he has just published against woman's rights, joins in the belief, "entertained by nearly every man, that women . . . are often lacking in the virtues, such as active courage, firmness of judgment, self-control, steadiness of conduct, and, above all, a certain sense of justice maintained even in the heat of party conflict." In approving this, the *Spectator* goes a step further:

> The basis of all government . . . is force. . . . Women also have less tenacity. This is a simple demonstrable fact. We wish to lay particular stress upon it, because in our own mind, it has a present application of conclusive urgency. Europe is entering upon a struggle for naval supremacy which . . . may mean a physical contest in which *the less resolute combatant* will surely be the loser.

Amid the din of charging suffragette cavalry, crashing window glass, and nightsticks thumping on feminine backs, constitutionalist and journalist heard a strange answer to their arguments.

Sydney Smith once defined benevolence as the feeling which A experienced when he thought that B ought to do something to relieve C's necessities. This vicarious excellence seems to-day to prevail in international public finance. The corporation tax works excellently in France, but, it is argued, is ill-suited to the United States. Mr. Lloyd-George finds that land taxes are admirable fiscal devices in the United States and Australia, but the Opposition is impressed with the totally different situation in Great Britain. The German Chancellor admires the patriotism with which the death duties and the legacy taxes are borne in England, but the Prussian Junker resents the importation of such a noxious fiscal project into the Fatherland. No expectant contributor sees the tax-halter draw "with good opinion of the law." If this mode of argument continues, the "shifting of taxation" will soon bear a different meaning. Like the criminal who asked as a dying favor that he might choose the tree on which to be hanged, the prospective tax-payer returns at night with the weary sheriff and confesses with tears that he cannot find a suitable tree.

The contrast between the latest utterances of the Kaiser and Lord Charles Beresford is significant. It is also very much in the Kaiser's favor. To use a nautical phrase, it quite takes the wind out of the sea-dog's sails. Lord Charles is not a panic-monger, and yet he insists on the necessity of expending between $275,000,000 and $300,000,000 on the navy, "in order to put the Empire in a state of safety by March, 1914." In the interim, what is to prevent Albion's foes from driving her from the seas? Lord Charles, it should seem, has as yet failed to substantiate the charges he launched against the Admiralty administration of Sir John Fisher. But with a Herculean reserve, he refrained from reference to the charges that are still *sub judice*. There might almost be a suspicion that the gallant tar is a veritable Hobson come to judgment, were it not for his reference to German industrial progress. The Kaiser in pacific fashion agrees with the doughty son of Neptune. In his recent interview with the head of the French Parliamentary Arbitration group, the Kaiser spoke deprecatingly of the current hysteria in England, and remarked that the British nervousness would disappear when Great Britain realized that by progress in industry she might regain her lost economic ground.

German method inheres even in German madness. So venturesome an undertaking as Zeppelin's proposed flight to the North Pole is to be gone at with an elaborate precaution which may be enough to turn madness into success. Before the final dash for the Pole, the region between the starting point and the goal is to be carefully explored for its geography and its meteorology. When Zeppelin sails at last it will be on no uncharted atmospheric seas. Were accident eliminated and the problem reduced to a mere question of distance to be traversed, Peary might yet see himself anticipated by the Germans. But, unfortunately, accident still thickly strews the paths of the aeronaut. True, that most dreaded peril to balloon and aeroplane, the tree, is beneficently absent from the Polar regions, and except for a possible impalement on the Pole itself, collision can occur only with an obstinate ice-hummock here or there. But that other dread foe, the wind, blusters sadly in these northern regions, and in case of storm everybody outside of England knows that there are no German regiments at the Pole to hold the airship down in safety.

M. Cruppi, Minister of Commerce, outlined on Monday, in his speech to the Deputies, the government's attitude toward the pending tariff revision in France. His speech was a singular blend of studied moderation in practice and of intellectual detachment as regards theory. A customs policy, he declared, is "not an essential factor in the economic development of nations." Free trade in Great Britain and protection in Germany are proof. But M. Cruppi would not disturb the *status quo*, and believes in the efficacy of an elastic tariff as a weapon in bargaining for markets. The "reasonable protection" which France has established he deems compatible with an extension of foreign trade by reciprocity treaties. But he deprecates the loud talk of tariff reprisals. With an export trade of a billion dollars he believes in soft words for the foreign customer. He undoubtedly impressed his auditors by citing the alarm evidenced by French chambers of commerce at the drastic way the Parliamentary commission on tariff revision is setting about its task. Especially delicate were M. Cruppi's allusions to Great Britain and the United States. It was the kind of counting-house prudence which appeals to the thrifty *bourgeoisie*. It shows a shrewd realization of the fact that French exports are largely of a luxurious or quasi-luxurious character. Silks, porcelain, wines, objects of art and of voluntary consumption, not necessities, are the wares that France excels in. It is the part of wisdom not to talk of drastic reprisals when the world at a pinch can do without many of these creations.

The most regrettable aspect, perhaps, of France's latest "affair," the navy scandal, is that the reactionary element will fashion a weapon for itself out of the exposure of frightful maladministration under the present régime. The Republican *bloc* which came into power under Waldeck-Rousseau was naturally concerned, first of all, with saving the country itself from threatened wreck over the Dreyfus affair. It was inevitable that reasons of political strategy should have outweighed every other consideration. Yet once the crisis had been weathered, the *bloc*, like every other government, should have concerned itself with governing. Now, the anti-Republican parties are in a position to show that what most Frenchmen consider the chief duty of their rulers, the maintenance of an adequate system of national defence, has been wofully neglected. When Gen. André, some ten years ago, set about ridding the army of anti-Republican intrigue, the result was, according to the opponents of the *bloc*, that the army was brought down to a state of disorganization which was first revealed in 1905, when France had to accept Germany's dictation concerning Morocco. Now come revelations which, if true, would argue that the French fleet is about as well prepared to meet an enemy as was the late Admiral Rozhestvensky.

The Young Turk leaders have evidently decided that the most pressing need of the moment is to ward off a second reactionary upheaval. They must show themselves as zealous for the maintenance of Ottoman supremacy in the Empire as they have hitherto been for constitutional progress. The attitude of the government in the matter of Crete is an instance in point. Had it consented to the occupation of that island by Greece, the government might have had another counter-revolution on its hands. In forcing the Powers to consent to a virtual continuance of the Cretan occupation, the Hilmi Ministry has closed, for a time at least, the mouths of the reactionaries. Parliament, meanwhile, has been working along the same lines. In giving statutory form to the various provisions of the Constitution of 1876, it has repeatedly laid stress on the connection between the Islamic religion and the Empire. Recently, the Chamber adopted an educational clause which provides that public instruction is free, but that "all schools are placed under the control of the government. The necessary measures shall be taken to assure to every Ottoman subject a uniform system of education." In spite of the accompanying guarantee that "there shall be no interference with the religious education of the different communities," the Greeks and Bulgarians profess to discern in the proposal of a uniform educational system under government control a possible curtailment of their existing rights.

NEARING THE TARIFF END.

Two reasons explain the speed—almost beyond the legal limit—with which the Senate is winding up its part of tariff-making. With the corporation tax adopted after less than a week's discussion, the Constitutional amendment authorizing an income tax passed without debate or even opposition, the special customs court voted in one day and the administrative features of the tariff agreed to at the same time, people might be excused for wondering what forces had suddenly overcome the Senatorial inertia. But there is always this kind of accelerated motion, when the Senate is dealing with large and controverted measures of legislation. The first paragraphs are debated with minute and apparently endless obstinacy. Time is wasted, and the endurance of mortal lungs and throats taxed to the uttermost. Despairing observers begin to think 'twill never be done. And then unexpectedly the whole discussion falls in a heap, and many of the sections which seemed to promise oratory world without end, are accepted without demur or delay. This is partly the result of sheer physical exhaustion. After three months of incessant use, the tongue even of a La Follette cleaves to the roof of his mouth. Moreover, the power of a disciplined majority has, by then, fully asserted itself. Opponents ask themselves wearily: "With mate in four moves inevitable, why insist upon making them all painstakingly?"

Another reason for the rapid crumbling of the Senate debate lies in the general conviction that the tariff is not really to be shaped by it. As Senators near the end, they are more and more impressed with the fact that their end is not the true end, that a great deal of insincerity and lack of finality has marked their procedure, and that the tariff law actually to be put in effect will be framed, as the English Parliamentary phrase is, "in another place." That place is the committee of conference between the two houses. The ten or twelve men who meet in secret are the real tariff-makers. What they report back will be put through *en bloc*, by the House of Representatives under special rule admitting of no amendment, and by the Senate under the irresistible pressure of party organization. So why need Senators haggle any longer over details which may issue from conference after having undergone a sea-change, altered into a shape which may or may not be rich, but which will certainly appear strange to those who begat them? Hence the growing desire in the Senate to get it over.

One would have said that the entirely new provision of the Senate bill, establishing a court with special and final jurisdiction in customs cases, would have furnished controversial matter enough to last the Senate a month. Yet it was dispatched in a single session. True, several vital amendments were adopted. Senator Rayner did good service in exposing some of the doubtfully constitutional, as well as manifestly unjust features of the plan, and secured their abandonment. The salaries of the new judges of the Customs Court were also cut down to the level of those of other Federal judges. With these changes made, and with the understanding that cases can be taken from the Customs Court by *certiorari* to the Supreme Court, when it can be alleged that flagrant injustice has been done, or property taken without due process of law, the chief objections of lawyers to the proposed court are removed. President Taft may be counted upon to appoint able and disinterested judges—even if this qualification rules out the men who have been toadying to Aldrich in the hope of judicial preferment.

The fact that every Senator present voted for the proposed amendment of the Constitution, authorizing the levy of an income tax, is not alone to be explained as a part of the bargain made by Aldrich and the President. Such unanimity is significant of a strong popular feeling in favor of a clear Constitutional warrant for that form of taxation. The House will undoubtedly agree with the Senate in this matter. It is said in Washington that those opposed to the tax are confident that the amendment will not be ratified by three-fourths of the States. They talk of eleven States—names not given—of which they say they are certain the Legislatures will reject the amendment. But such predictions are more easily made than fulfilled. The arguments for the amendment are not necessarily arguments for the tax. It may fairly be maintained that the power to lay an income tax ought to exist, even if it be unwise to use it at present. The opinion of the Supreme Court judges, as well as the utterances of Presidents and other public men, shows how serious a thing it might be for the nation, if in a great emergency, it found itself shorn of the right to place a direct tax on incomes. Add to this consideration the obvious spread of the conviction that the Federal government will be compelled in the future to resort to direct taxes more freely than at any time since the civil war, and the chances that the Constitutional amendment will be ratified by the necessary number of States, seem to us to be very good. We shall know within two years whether there is, after all, any truth in the assertion so often made that it has become impossible to amend the Constitution of the United States.

With the whole tariff question now nearing its final stages, the responsibility of President Taft for the ultimate form of this legislation grows acute. The country looks to him to exert all his influence and authority to induce the conference committees to agree upon a bill which he can honorably sign, and which the people will not regard as a betrayal and a mockery.

THE SCIENCE OF RACE-HATRED.

Two recent magazine articles on the negro invite consideration because of their individual significance and the contrast they offer. In the July *McClure's*, William Archer enters on a thorough search for a solution to the negro problem, after he has convinced himself that such a problem exists. Having enumerated the four possible ways in which the South can deal with the question—all of them calling for "almost superhuman wisdom, energy, and courage"—Mr. Archer finds it impossible to conceive that the negro can be exterminated, assimilated, or tolerated, and therefore pronounces in favor of segregation. A negro State within the Union might be built up, at first by the voluntary emigration, and after some twenty-five years by the forcible transportation, of all negroes under the age of forty-five. Into the details of a scheme which the writer admits is one of enormous difficulty, we need not enter here. The idea is not a new one. Whether either white men or black men in the South want such a State, whether such a State could be erected, and, if erected, whether it could long exist, are really questions of more than magazine scope.

Booker T. Washington s opinion of the plan is well known. Given a separate negro State, it would take a very high wall to keep the negro inside, and three or four very high walls to keep the white man out.

But it is with the writer's moral justification of his scheme that we are concerned. Mr. Archer widens the question from the negro and the South to the world and its various races. He argues:

"But," it may be said, "the rights and liberties of civilized humanity include the right to move freely hither and thither over the face of the earth. This right, at any rate, would be denied to the Afro-American, inclosed within the ring-fence of his own State." There is, I think, a sufficient answer to this objection. The right to travel would not be denied to the negro. Nor would he be debarred from emigrating and settling abroad among any community that was willing to receive him. It is, I think, becoming more and more clear that the right of every man, white, black, or yellow, to effect a permanent settlement outside his own country, is subject to this qualification. The idea that all the world ought to belong equally to all men, and that rational development tends toward an unrestricted intermingling of races, seems to be signally contradicted by the trend of events. Is it not the great essential for the ultimate world-peace that races should learn to keep themselves to themselves?

This is plain speaking. It immediately suggests the other article to which we have alluded, William English Walling's "Science and Human Brotherhood," in a late number of the *Independent*. Mr. Walling is without doubt an enthusiast. He is quite as strongly in favor of race admixture as Mr. Archer says the white South is against it. But, again, it is not with Mr. Walling's specific views that we have to do, but with the general issue he raises. Are we in the midst of a reaction away from those ideals of democracy and of human brotherhood to which the eighteenth century gave birth and from which the nineteenth century drew its nourishment? Our writer protests against what he describes as the growing Nietzscheanism of the times. Under modern names and backed by scientific instead of theological authority, the ideals of caste, of national exclusiveness, of the rule of force, are coming back to thrive among us. As for the Declaration of Independence, all scholars know nowadays that it embodies a vicious compound of Rousseauism and demagogy.

Such a view of the present march of civilization seems to us greatly exaggerated. But that such a view should be entertained seems natural enough when a man so conspicuously identified as is Mr. Archer with progressive ideals in literature and other fields of life, finds it easy to ask, "Is it not the great essential for the ultimate world-peace that races should learn to keep themselves to themselves?" Put aside the utter insufficiency of real evidence in favor of such a contention. Pass over the fact that a half-dozen years of Imperialist madness cut no permanent groove for the progress of the world. Merely consider that the ideal of race-exclusiveness here hinted at means nothing less than a throw-back to conditions that antedate civilization. High Chinese walls around every country to keep out not only the stranger's goods, but the stranger himself—that is what the modern theories of race-superiority and race-purity bring us to. Mr. Walling asks:

Will the defenders of individual freedom, social justice, and human brotherhood awake in time to the danger of the most monstrous reversion in history since the foundation of the religions of human brotherhood and love two thousand, yes, three thousand years before the period when the world was made physically one by steam and electricity, and half the population of the earth became sufficiently enlightened to claim a share in the world's progress?

We do not think the danger so imminent as all that. We find it deplorable, nevertheless, that Western thought should be dandling about ideals which we associate with a somnolent China and a caste-ridden India, and at a time when China and India are forcing their painful but steady way towards Western ideals.

The position held by Mr. Archer considers itself, and is apt to be considered, as scientific. His opponent's views are apt to be stigmatized as sentimental. Yet deeper reflection will show that science in a truer sense is with the old humanitarian view against the race and caste advocates. The chief scientific characteristic of the latter is their cold-bloodedness. A segregated negro State, a locked-up frontier, is impressive because it is cruel. It is not scientific to fix one's gaze upon the present spasm of militarism in Europe, and overlook the growing desire of the world's masses for peace, as twice shown at The Hague. It is not scientific to dwell on the defects of democracy in the West, and to pass over the stirring of nearly all Asia to democracy. It is not even scientific to interpret racial conflict as tending to racial exclusiveness. California's and Australia's hostility to the Japanese seems to Mr. Archer proof that the races must be kept apart. But it is nearer the truth to say that the existence of anti-Japanese feeling only means that the old rule of exclusiveness will no longer work. When the Japanese didn't count, no one disliked them. Now they do count, and, for all the temporary hatreds and exclusion laws, they must make their way to equality as their strength grows. Civilization which has grown by contact among the nations of the earth will not tolerate the splitting up of the nations.

AS BAEDEKER SEES US.

There is one pleasure which loyal members of the "See America First" society can never enjoy. This is the pleasure of perusing Baedeker's United States from the comparative point of view. The American tourist who associates the limp red binding with old-world associations gets a positive thrill from the inspection of the volume devoted to his own native land. John Graham Brooks in his recent volume, "As Others See Us," has skimmed the cream from many a volume of forgotten lore about our country, but did not include the impersonal Baedeker. It must not be imagined that anything one could say of this world-renowned series of travellers' hand-books can add to or detract from their merits. They have become an international institution. But one may venture to indulge in reflections upon the Procrustean formality with which they envelop the business of travel. Their Olympian aloofness and cosmopolitanism do not alter with a change in latitude. The serious-minded British globe-trotter and the indefatigable German tourist insist on taking their pleasures sadly, and find support in the ever-faithful Baedeker.

Despite the fact that Dr. J. F. Muirhead has for over a quarter of a century had charge of the English editions of Baedeker, the style has been thoroughly subdued to the material in which he works. The introductory article proves this up to the hilt. Beginning, as is proper, with the question of the expense of an American tour, he remarks truly enough that it may be reckoned inevit-

ably from one-fourth to one-third more in this country than abroad. "Persons of moderate requirements," however, by frequenting boarding houses, instead of hotels, and by avoiding carriage hire, may travel comfortably in this country. On one point he is very reassuring: "Throughout almost the whole country, travelling is now as safe as in the most civilized parts of the world, and the carrying of arms, which, indeed, is forbidden in many States, is as unnecessary here as there." Thrice armed is he who has his sensibilities under control. "He should, from the outset, reconcile himself to the absence of deference or servility on the part of those he considers his social inferiors; but, if ready himself to be courteous on a footing of equality, he will seldom meet any real impoliteness." As to hotels, the best American hostelries will be found "fully as comfortable as the first-class hotels of Europe by all who can accommodate themselves to the manners of the country, etc." Real penetration is evidenced, however, in the warning to avoid restaurants "which solicit the patronage of 'gents' "; and discrimination in the remark that "soap, curiously enough, though provided in hotels, is not provided in boarding houses or lodgings." Ringing for soap is evidently not a monopoly of the traveller in effete Europe.

As to travelling, he weighs carefully the respective merits of the American and European railway carriage, or "car," as he notes it is called here. A "single crying infant or spoiled child may here annoy from sixty to seventy people," whereas abroad the worriment will be confined to "the few in the compartment." Rugs, as a rule, are not necessary upon our trains. Indeed, our trains are generally overheated, even in winter, we are informed. But there are corresponding advantages, such as the amusement derivable from watching the other occupants of the long car, though, in case of accident, there are but two exits. He does not commit himself to a final decision, yet he is not quite without hopes of us. Even at Niagara Falls, "the former extortionate charges and impertinent demeanour of the Niagara hackmen have been somewhat abated." Under "General Hints," the comparative method of sociological induction yields the following gem: "The art of the *Barber and Hair-Dresser* has been developed to a high point in the United States, where the 'tonsorial saloons' are often very luxurious. The prices, however, are high, 10-25 cents for a shave, including hair-brushing and the application of essences."

Most important, however, are the tourists' Glossary and the allied hints about social usages upon the frontier. "An American takes a lady *out* to dinner, while an Englishman takes her *in*." To "wait on" the table does not imply that the *garçon* here leans against or sits on the festal board, but is merely the American equivalent of "waiting at" dinner. A "block" is a "rectangular mass of building, bounded by four streets." A "deck" is a "pack of cards," though with Teutonic thoroughness it is noted that this use of the term is found in Shakespeare. A "bug" is *anglice* "a beetle, insect of almost any kind." And time itself would fail us to tell of the patience with which "gums" and "rubbers," "biscuit" and "crackers," "grips" and "baggage," "high Balls" and "chowders," "pie" and "parlor," are defined for the wandering subjects of the Kaiser or the King. We were sometimes disposed to complain of a certain condescension in foreigners. We were sometimes inclined to ask shudderingly how we were vulgar, and were rebuffed by the answer, "Because thou art not like unto us," from Lucifer, Son of the Morning. But we have changed all that. Our sensibilities ought no more to be wounded by the stranger within our gates. For as the excellent Baedeker says: "The first requisites for the enjoyment of a tour in the United States are an absence of prejudice and a willingness to accommodate one's self to the customs of the country."

WHY WE COMMEMORATE CALVIN.

I.

It would probably be difficult to find anywhere to-day more than a handful of persons who would really enjoy being called by the name of "Calvinist." Yet the Protestant world is joining with singular unanimity in celebrating, on the tenth day of this month, the four hundredth anniversary of Calvin's birth. Geneva, the scene of his chief outward activities, will, in these days, be the central point of interest for all those, who, divided in every detail of religious organization, are one in their opposition to a church of authority. If we can explain this apparent paradox, we shall come near to an understanding of what Calvin means to the thinking men of our day.

The approach of the present anniversary has revived to a notable extent interest in Calvin's dominating, but perplexing, personality. The materials for the history of his life and work have been presented to the world in absolute completeness, and biographical studies of greater or less extent have helped in a general understanding of the man and his meaning for the world. Still, after all, the popular impression of him remains singularly inadequate. Probably most Protestants and all Catholics continue to hold the idea once expressed in the writer's hearing by an educated woman, that Calvin was a malignant, at times a furious, fanatic finding his chief satisfaction in violent controversy, a man whose memory was to be execrated and whose example was valuable only as a horrible warning. Nothing could be further from the truth. "Fanatic" is the last word that could properly be applied to Calvin. If it means anything, it means a man so absorbed by one idea that all others lose their proper proportion in his mind. From the first moment of his approach to the problems of his life, Calvin shows us the type of the deliberate, systematic, constructive mind to which all fanaticism is specially abhorrent, which cannot even co-exist with it. No fanatic has ever become a great leader of men along lines of constructive utility. Fanatics have, indeed, often given the inspiration that has roused enthusiasm and led indirectly to great results, but they have never built up the world's systems, either of thought or of social organization.

If we inquire into the causes of Calvin's influence, we shall be impressed first of all by its universality. The other great leaders of reform, Wycliffe, Hus, Luther, Zwingli, were, each in his time, identified with the special needs and the historical conditions of a single country. Each of these men represented, in a singularly true and singularly complete sense, the spirit of his own nation. Each was in his own way and has remained ever since the popular type of the people he primarily served. It might fairly be said of each, that he was the natural product of the national genius. His work was done for the nation and was made possible through it. The man and the nation belonged together, reacted upon each other, determined each other's character and defined the limits of expression within which each might move.

No such limitation exists in the case of Calvin. True, he was, as has often been pointed out, in many ways a typical product of the French genius; but France would not receive this, one of the greatest of her sons. She drove him out into an exile, bitter at first and never to become quite sweet to his emi-

nently domestic and affectionate nature. Through this exile, he lost that background of national support his earlier colleagues had possessed, but the gain was greater than the loss. Without fault or merit of his own, he was freed from a multitude of complications that had fettered in countless ways the thought and the action of the other reformatory leaders. They had been compelled at every turn to take account of the social and political conditions of their several lands. They had, almost from the first, been driven into compromises and adjustments that had seriously modified their own original views. They had had to consider ways and means, sometimes to play fast and loose with the standards of right they had themselves laid down, and all this had cost them dearly in the estimation of the world, even the world of sympathizers outside.

If, for example, we compare the Luther of 1520 with the Luther of 1530, we are at once impressed with the change that has come over his ideals. Step by step during that decade he had been driven from one position after another by the insistent demands of one and another policy too important for him to overlook. He had been warned by the extravagances of the radical wing on the one hand, and by the conservatism of existing powers on the other. His attitude, defiant at first, had by 1530 become largely apologetic. The great Confession of Augsburg, the Constitution of later Lutheranism, is penetrated throughout by the spirit of compromise made necessary by the complications of German political and social life. We are not questioning either the wisdom of this attitude or the nobility of the ideals still preserved in the Lutheran position. We are only illustrating the practical limitations of nationality and world-politics that kept the Lutheran movement mainly within the sphere of German life. It would be easy also to draw similar illustrations from Switzerland, from Bohemia, and from England. In each of these cases the Reformation had to make its way into the structure of an already fixed social and political order, and the measure of its success depended largely upon the degree to which it could conciliate the various elements of that society.

II.

If now we turn to Calvin we find an entirely different situation. The exile of 1535 remained an exile throughout his long life. Geneva, the home of his active years, was never the "place where he belonged." Instead of claiming him as its own, as Bohemia claimed Hus, it was rather taken in hand by him as material for the working out of ideas already elaborated elsewhere. Geneva was Calvin's laboratory, not his fatherland. Calvin belongs, therefore, not to Geneva, as Luther belongs to Germany, but to the world. His greatest work for humanity was not so much what he did for and with Geneva, as in the system of ideas worked out into tangible form before the thought of carrying them out into practice could ever have occurred to him. The author of the "Christian Institution" was a young, solitary, and homeless scholar, living, like so many others of his class, under the sheltering hospitality of that Swiss town of Basel, where Erasmus had spent his most peaceful and most fruitful years. The theology of the Reformation in its main propositions was already established. Under its Lutheran and its Zwinglian forms it was making its way; but so far no one had gone at the problem free of all entanglements, as a theologian pure and simple. It is true, Calvin addressed his appeal directly to the French king, but one feels at once that the audience he had in mind was as wide as the interest in religious things.

If we compare this appeal to the French government with Luther's "Address to the Christian Nobility of Germany," the difference is obvious. Luther proposes a series of practical measures whereby the religious ideas he would enforce might be realized under the leadership of the only "safe" class in the community to which he belonged. Calvin rises above all immediate questions of policy into the higher regions of speculative thought, entrusting to time and circumstance the realization of his ideals. It is this quality of universal appeal that more than anything else has made Calvin a name of dignity in the world of thought. Agree with him or not as we may, we recognize in him the man of universal grasp on the greatest problems of the religious life.

Keeping still within the field of speculation we may find a second explanation of Calvin's permanent influence in his emphasis on the great fundamental fact of human sinfulness. In our more joyous and, I venture to believe, sounder view of human life we shall doubtless feel at first thought as if this were but a sorry title to the lasting memory of our kind. Calvinism suggests probably to most of us, first of all a sour-faced disapproval of most pleasant and natural things, a gloomy insistence upon a Hebrew standard of morality little in harmony with our modern respect for what is natural and our modern sympathy with what is beautiful. That Calvin's emphasis on the sinful side of human experience was exaggerated, we need not question. It was exaggerated, as every reaction against rooted evil must be, if it is to be effective. It becomes intelligible only when it is seen in relief against the background of evil it was designed to remedy. Calvin's service in this matter was in making once again clear to the conscience of Christians that sin was a fact of individual experience, not a mere theological device to explain the mystery of human nature, but a tremendous, insistent fact, not to be explained away by theological ingenuity, nor palliated by ecclesiastical devices, but met squarely and dealt with in such fashion as the corporate conscience of Christianity might approve. Of course, in seeking support for his position he went back to the source of all later thinking on the fundamental problems of man's moral nature, to Augustine, and reminded the world anew of its debt to that singular medley of reason and unreason, the Augustinian theology. Of course, again, in so doing he ran perilously near the line along which Augustine was always coasting, the borderland of dualistic thought, ever tempting with its easy solution the loyalty of every Christian thinker who approached its frontier. His nickname of *Novus Manichæus* shows that his contemporaries did not fail to see his peril. He saved himself as Augustine had saved himself, by insisting, after all was said, upon the unity of the divine, even to the point of admitting the divine authorship of what man in his blindness calls "evil."

III.

To estimate this service of Calvin we must look at it, not in the light of our modern adjustments, compromises, or by whatever name we may call our ways of getting along with our consciences, public and private, but rather in the light of what Calvin, in common with the whole Protestant world, was trying to replace. His work was dictated by a profound sense of the need of reform, which no right-minded man of his day could overlook. Least of all could right-thinking Catholics afford, for the sake of their own institutions, to neglect the insistent demand for a pretty thorough overhauling of the whole ecclesiastical system. With the pitiless logic of the French mind, Calvin went straight to the heart of the matter, and found his solution in that emphasis upon personal sin as a part of the very nature of every human being which we are here considering. He had no new criticism of the existing order to offer. All that had been done before. From Wycliffe on there had been no lack of reminders as to the outward ills of the ecclesiastical body. What was needed was some principle whereby men could coördinate and harmonize all the varied forms of protest that so far had been inefficient for lack of such a rational unity. Neither was there any absolute novelty in the proposition regarding sin in itself. The Church accepted it and had built up its machinery of sacramental remedy and recovery upon it. What was new was the emphatic position given by Calvin to sin as the central fact in man's dealing with his religious needs.

Under the Roman system this consciousness of sin, though theologically accepted, had in practice become obscured and confused in a mechanism that kept the mass of believers satisfied, but could never escape the criticism of whoever could read the signs of the times. The reformers preceding Calvin had paltered with the sacramental system, trying to hold as much of it as possible out of regard for the weaknesses of those on whom they depended for support, both from above and from below. Calvin, to all intents and purposes, threw away these fictitious props to the religious life, calling sinful men back sharply to their sin and giving them what he believed to be the true means of remedy.

It is impossible to pass over this chapter of Calvin's activity without reference to what would now probably be thought his most repellant doctrine. The idea of predestination had never been able to take deep root in Christian soil. Ever since Augustine it had risen now and again to the surface of discussion, only to be either repudiated or so greatly modified as to lose its most distinctive character. Augustine himself had distinctly balked at the extreme form of putting the inevitable logic of the situation. He was willing to accept a selection of those destined to be saved, but he could not go the length of admitting a divine determination of those who were to be lost. Calvin did not shrink from this dire alternative. From the point of view of God, *i. e.*, of an ultimate philosophy, such as Calvin believed himself to possess, there was no great difficulty in accepting the idea that divine knowledge and divine will were so absolutely one that the final destiny of every man was determined in every sense in that infinite plan, which lay at the back of all Augustinian thought. The horror of the "double" predestination comes when we frail mortals try to bring in the element of human will and human responsibility. Calvin saved the day for himself and for those who followed his conclusions, as Luther had done before him, by the doctrine of justification by faith. The man of faith brought—or, what was the same thing, believed he brought—his own will so entirely into harmony with the divine that there was no contradiction between them, not indeed once for all, but so that a continual effort was necessary.

That is the explanation of the extraordinary grip of the Calvinistic morality upon minds of a certain type wherever they were found. French Huguenot, English Independent, Scotch Covenanter, New England Puritan, all alike were seized by the irresistible logic of Calvin's argument. The obvious comment, heard already in Augustine's day, that all predestination was fatal to morality, because, if a man's fate were determined beforehand, all motive to morality was taken away, proved itself utterly irrelevant. It was precisely this fact, this stripping away every element of bargaining with Providence, this categorical imperative without reference to rewards and punishments, that stiffened the moral sense and braced it to meet the assaults of temptation. The principle of effort, personal to every man, unaided by human mechanism, necessary at every point and wholly without guarantee as to its final result—this was something worth while for strong men and patient women. They were nerved to the effort, not by the hope of [illegible] by the conviction that they were thus entering vitally and personally into the "inscrutable plan of God." Right was right, no longer in virtue of a canonical system depending upon human enactments or human compromises, but because of an imperative command, laid down by divine sanction and needing to be interpreted only by the human conscience, guided by such light as a reverent study of the "Word of God" would give.

IV.

It is this directness of appeal that forms the third claim of Calvin to the respect of the modern world. It would, of course, be the insanity of laudation to describe Calvin as an apostle of religious liberty as we of to-day understand the word. Such an idea was utterly foreign to the thought of the sixteenth century. Men were searching, not for any abstract liberty, but for trustworthy guidance. They were repudiating the direction of an institution that seemed to have outlived its usefulness, but they were not proclaiming "Rights of Man" nor building temples to the "Goddess of Reason." They were seeking, in bitter earnestness of soul, for a better guide, and believed they had found it in the infallible written word. It needs no skill to point out the crudities and absurdities of any literal Scripturalism, Hebrew, Mohammedan, or Christian. Such criticism is only too easy, and it has been tried in every possible form. Nothing useful can be gained by it. To ridicule the appeal to Scripture as narrow and blind and fatal to human progress, is only to miss the point of the real Calvinistic contribution to the world's movement. The doctrine of the final authority of Scripture may well be compared to the theory of law which has led now and again to important codifications of existing legal practice. Society was getting along rather clumsily with its precedents and their interpretation by the courts, but how much neater it would all be if this mass of confusion could but once be analyzed out into chapters and paragraphs so that he who runs might read. So codes of law have been made. But, alas! no sooner was the ink dry upon their pages than the process of interpretation has had to be begun over again, lest the law, the hourly creation of the changing needs of men, should be hardened into a rigid system sure to defeat the very ends of justice for which it was framed.

This appeal to Scripture is really the summons to every individual man to go for himself to the original sources of Christian truth, and to interpret them for himself in the light of every illumination he can bring to bear upon them. If from time to time experts throw new light upon the meaning of Scripture, their appeal is again to the reason and conscience of the individual, and so new regions of thought and experience are opened up for the profit of generations to come. Such illumination can come only out of the continuous effort of individuals stimulated to their best thought by the call to personal action.

To this directness of the appeal to faith corresponds, then, a similar directness in man's approach to his God in every stage of worship. As he is free to believe what he must, without the dictation of any organization, so he is free to come face to face with the divine mystery without the aid of any priestly intervention. "The priesthood of the Christian man," the idea that every believing soul stands just as near to the sources of all truth as any "ordination" can ever bring him, is in many ways the most precious legacy of the Reformation. No doctrine of the reformers struck more vitally than this at the vested interests of every establishment or called forth more violent opposition. The reforming churches modified it in practice. Their ministries became sometimes as despotic and as arrogant as any apostolic succession could ever be, yet these ministries could never forget that they owed their authority, in the last resort, to their own personal superiority, intellectual and spiritual, to the people they guided, and would lose it if they failed in these particulars. The sources were as open to one as to the other, and if the ministry should deny a reverent freedom to their flock, they would be undermining the very basis of their own influence.

It would, of course, be idle to maintain that all these glorious possibilities were realized in the Geneva of Calvin: but the history of his struggle there to make his abstract scheme of a *civitas Dei* acceptable to the warring factions of the Genevese citizens is a perfect illustration of the principles we are considering. These hard-headed citizens had not thrown off one tyranny, only to accept another. The Reform must commend itself to them in all essential ways before they would commit themselves to it. The notion that Calvin, in some mysterious fashion, hypnotized Geneva into a blind obedience to his will, as the saintly heroes of the Middle Ages

won their victories by appeals to the superstition of a credulous age, is wholly erroneous. His life there was one long conflict with men who were as determined as he not to accept what did not commend itself to their judgment.

V.

The universality of his appeal, the emphasis upon personal sin and the directness of the approach to God as the way of salvation, these were what roused the individual to a new religious experience, and these constitute the chief part of the world's debt to Calvin. One other side of his activity claims our attention. Calvin was, indeed, primarily a theologian, but his idea of theology was a very large one. Already, in the first draft of an "Institutio Christiana," he had outlined his view of the mutual relation of religion and the state. Developed theoretically in the later editions and put into practice at Geneva, this contribution to political science forms the practical commentary upon the soundness of the more speculative achievements of Calvin's genius. The example of England, where a determined monarch had declared himself under God Head of the Church in his realm, filled him with indignation. The Lutheran solution of expediency which allowed the head of the state to dictate the religion of his subjects was hardly less repellent to him. In principle his ideal differed little from that of the Roman Church. Like that, it favored complete independence of church and state, provided only that the state should be absolutely dominated by religious purpose. The world owes to Calvin the lesson to be learned from his model experiment with the little community of Geneva. It was, humanly speaking, an accident that gave Calvin his opportunity. So far as we know, he was not seeking a chance to put his theoretical scheme into practice, but was simply resting at Geneva in the course of a journey back from Italy to his study in Basel, when he was importuned by his early friend, Farel, then chief minister of the reformed Geneva church, to stay and help him in his difficult task. We cannot even be sure that the opportunity was welcome to Calvin. He had never been what we now call an "organizer." He was anxious to be back at his congenial studies. His *nolo episcopari* was more than the conventional reluctance of the canonical tradition. Yet that momentous resolve to lend a hand where it was sorely needed gave an impulse to the whole process of delimiting the civil and the spiritual powers, the most recent wave of which has appeared in the final separation of church and state at Geneva itself. The advocates of that separation were the true spiritual children of Calvin, rather than their opponents, who claimed that title for themselves.

The Calvinistic state was, indeed, very far from being what we now think of under the name of a purely civil order. Its ideal was almost a theocratic one. It conceived of a community so thoroughly penetrated by religious feeling that its government should be only the working expression of religion. It was not that the government, being something different from the people, as in a German principality, might dictate the forms of religious belief and practice. Rather, the government was the instrument whereby the people was to carry out its highest ideals into beneficent practice. Yet Calvin's ideal form of government was not a democracy any more than it was a monarchy. It was an aristocracy, that is, really a government by the best fitted to govern, and so far as the world has advanced in this matter the results have at least not yet disproved the value of this ideal.

It is through this principle of a civil community interpenetrated with the ideals of a kingdom of God on earth, that we come to Calvin's chief service as a teacher, although an unconscious one, of human liberty. If it were true that every man had a right to be heard on the most important problems of the spiritual life, and if the community as a whole were to be founded upon the best results of such deliberation, then it seemed to follow of necessity that every man might also in the last analysis have a right to his opinion on the problems of social order as well. This conclusion did not need to be drawn in any theoretical fashion. It was suggested by the very working of the Calvinistic state itself. It was idle for leaders of the Reformation to protest that they were not advocating a liberty that in the end must prove dangerous to the tyrannies of every land in which it could gain a foothold. It was only a momentary check that came from such a monstrous inconsistency as the destruction of Servetus, carried out by Calvin and approved by the leaders of the reformed churches everywhere. The ancient Church was perfectly right in maintaining that the impulse of the religious revolution could not be permitted to go on without danger to all the traditions it held most precious. It was impossible for the reformed state not to go further. If the sources of religion were to be understood in such a way as to make them vital for the people's good, then they must be studied, no longer in the foolish manner of the mediæval allegorizing method, but with an honest desire to know what the writers of the sacred books really said and meant. If such study were to be successful, education must be directed to this end. If education were to be free to work out its own ends, it must be protected by the civil order. Scholarship must be raised from the service of a religious institution to an independent standing as the indispensable foundation of all sound doctrine. If the enlightened human reason were, indeed, as Calvin maintained, a necessary adjunct to a complete understanding of the word of God, then it was obvious that a sound philosophy must come in to make the mere linguistic accuracy of Christian scholarship effective. In short, if we examine the progress of all modern liberal thought, we see that the way was prepared for it by the struggles after clearness of the systematic reformers and, above all, of Calvin and his successors. There is no fact better worth impressing on the modern liberal churches than this: that they have come to be what they are through a development out of the Calvinism they are only too ready to undervalue or to despise. Whatever they have that is most vital to the religious experience of to-day, they owe, not to the rags of ecclesiasticism that still cling about a timid Protestantism, but to the sound, creative principle of reverent liberty that is the best heritage of John Calvin. EPHRAIM EMERTON.

NEWS FOR BIBLIOPHILES.

The volumes of Charles Evans's great "American Bibliography" are coming along with surprising regularity. Vol. V, covering the period 1774 to 1778, has just been sent out by the author from his home in Rogers Park, Chicago. This was a prolific period for the American Press, and 3,085 books, pamphlets, and broadsides appearing in those six years are described in the present volume. The total number of items recorded from the introduction of printing in 1639 to the end of 1778 is 16,176. With each volume the quality of Mr. Evans's work improves. His first volume was mainly a compilation, few of the books were described *de visu*. Now he is getting into a broader and fresher field, much of his work is new, and his descriptions are largely made from the books themselves. As he points out in his preface to the present volume, up to 1774 the literature of America had been distinctly religious. But for a period beginning with 1774 the intellectual effort of the best minds of the colonies were occupied with political discussion, and the presses teemed with political pamphlets. The first Congress met at Philadelphia, September 5, 1774, and extracts from their proceedings were reprinted in most of the colonies. These various publications have been well worked up by Worthington C. Ford, in his edition of the "Journals" being brought out by the Library of Congress. In January, 1776, Thomas Paine's "Common Sense" appeared anonymously from the press of Robert Bell in Philadelphia, and of the twelve editions, according to Mr. Evans, not less than a hundred thousand copies were printed. The Legislature of Pennsylvania voted its author five hundred pounds in appreciation of its value to the cause of American liberty.

The difficulty of securing paper must at that time having seriously hampered the printers. Some copies of "Additions to Plain Truth; addressed to the Inhabitants of America," printed by Bell in 1776, have

the latter portion printed on blue paper with a slip:

To every purchaser. The impossibility of obtaining white, constituted the law of necessity for part of these Additions to appear in blue. The philosopher reacheth beyond outward appearances. The patriot surmounted every difficulty. And the bookseller industriously attempteth business, agreeable to the prescriptions and decrees of the British and American laws of freedom concerning the liberty of the press. Third Street, April 24th, 1776.

Another printer, Isaac Collins of Burlington, in his Almanac for 1773, says:

> Paper so scarce is grown of late
> My customers I stint,
> For tho' I've matter in my Pate
> It can't get into print.

In our notices of the preceding volumes we have called attention to the wastefulness of the space in the column headed "Auction Values." It is even more notable here. Out of the 3,085 titles recorded "auction values" are given for seventy-six only. No effort whatever seems to have been made to secure this information, and the values where given are largely from the Brinley sales and other now antiquated records. Misleading values are worse than useless. As examples: for Romans's "History of East and West Florida," 1775, the Barlow sale record of $85 is given, though a copy brought $410 in the Conely sale at Libbie's in 1902. For that Tory tract, "A Dialogue between a Southern Delegate and his Spouse," 1774, the "value" is given as $16, though $100 was paid for the Pennypacker copy in 1907. Other similar cases might be noted.

Correspondence.

WAS JOHN COTTON THE PRECEPTOR OF HENRY VANE?

To the Editor of The Nation:

Sir: The letter of Dr. Henry M. King in your issue of June 10, "Was John Cotton the Preceptor of Sir Henry Vane?' since it calls in question statements made in the present writer's "Life of Young Sir Henry Vane," of twenty years ago, is a challenge to maintain, if it can be done, those positions. That Vane was affected by his association with John Cotton, Dr. King denies; and in general that an influence went back from New England to Old England which was potent in shaping the English Commonwealth, he gravely doubts. In these opinions Dr. King rejects the conclusions of J. Wingate Thornton, in his "Historical Relations of New England and the English Commonwealth" (*passim*) and of David Masson, in his "John Milton" (vol. II, pp. 597-8).

He attaches no weight also to the contemporary testimony of Baillie, the Covenanter, the enemy of the English Commonwealth, nor to that of the Independent ministers and leaders who promoted it powerfully. The popular cry of the days of the English Civil War, that Independency was "the New England Way," Dr. King makes little account of. If his opinions are just we must regard as discredited one of the most picturesque and interesting traditions of New England history, which until now no good scholar has seemed inclined to question.

As regards an influence upon Vane proceeding from Cotton, Dr. King objects to the phrase "trained in Cotton's study," employed by Thornton and approved by the present writer in his biography. Vane in New England was little more than a boy in years, but twenty-three in fact, finely endowed and precocious indeed, ripened, too, by remarkable experiences, for he had travelled over Europe as far as Vienna in the depth of the Thirty Years' War, seen life in courts, camps, and universities, and enjoyed the privileges of a high-born English youth. He was nevertheless immature, showing plainly in his New England career the youthful faults of conceit, petulance, and unsteadiness. He was, of course, susceptible to influences from his environments. He had been trained at Westminster and Oxford, trained also, there is too much reason to suppose, at Vienna in the crafty atmosphere of the Jesuits, who, under Ferdinand II, were laboring to undo the Reformation; trained also among Calvinistic disputants in Protestant lands. Now came a time of training in John Cotton's study. What manner of man was John Cotton? If we had only his writings to judge from, he is at a disadvantage as compared with several of his New England contemporaries. To modern readers he is less interesting than the candid and sensible Winthrop, the bold and earnest Roger Williams, the pungent Nathaniel Ward, "The Simple Cobbler of Agawam." In the enormous perplexities, moreover, among which his lot was cast, his course was sometimes vacillating and inconsistent. In spite of all this he must be reckoned one of the best purposed and forceful Englishmen of his day. For a generation his character leavened the life of the Eastern counties of England in a marvellous way. After his emigration he dominated New England no less; he maintained his prestige, though unsteady in his politics and theology and apparently treacherous in his friendships; and when he died at last the people who had felt his power saw portents in the heavens as at the passing of almost a God-inspired prophet.

With this strong figure, then, in full maturity, Vane, at an age when all men are impressionable, came into close association for many months. Dr. King thinks Vane must have regarded Cotton with repulsion. Why, then, did Vane seek Cotton out and cling to him? Dr. King does not question the accepted story that during Vane's sojourn in America they lived together by Vane's election in the same house. So far from being repelled, Vane was plainly attracted by Cotton. They had many points in sympathy, notably an admiration for the prophetess Anne Hutchison. Cotton was no democrat, avers Dr. King. Nor was Vane a democrat, for not until a time long after this did he accept the doctrine of the sovereignty of the people. Of course they differed. When is it otherwise in contacts of vigorous natures? There is the best evidence that for Vane Cotton was a presence winning and congenial. As the two leaders of the colony, Winthrop being for the moment in the background, we may infer without much stretch of the imagination what they talked about. Certainly the constitution of the churches would be a topic, and the author of "The Way of the Churches" and "The Keys," epoch-making tracts of Cotton about to appear and become the accepted text-books of Independency, would instil into Vane's mind Independency—a thought, of course, not new to the youth, for, as Dr. King rightly declares, it had been working its way in England for half a century. But the veteran's convictions would certainly not fail to clear and deepen the idea in the mind of the inciplent champion. In 1637 Vane and Cotton parted, the latter to pursue a career in which a disposition naturally broad and kind was warped into severity and narrowness which would not have developed among other surroundings, the former to move among conditions which carried him at last into an atmosphere of the freest. The facts of human nature being what they are, Vane must have carried an impress from Cotton. Besides his wide training in other schools, it is certain he was trained in Cotton's study.

As to the claim that New England had an important influence in the setting up of the English Commonwealth, a claim which Dr. King seems to think not well founded, since New England Congregationalism was something quite different from Independency, this may be said. For full half a century, no doubt, before the Plymouth and Massachusetts immigrations, Robert Browne's leaven was working in England. Independency was, however, a movement under the surface, not effectively voiced, and without vogue among the classes which held place and power. It was nevertheless struggling up, and notably the founders of Massachusetts Bay were scholars and gentlemen well disposed toward free ideas. At the setting up of the First Church, August 27, 1630, the church of Plymouth was invited to appear and take part. Plymouth sent its delegates, who, however, were prevented by storms from arriving in time. The ceremony was of the simplest, the ordination of Wilson and Nowell being by a simple laying on of hands by members of the congregation, and when the Plymouth men, out and out Separatists, arrived, all that had been done was fully approved. Winthrop was naturally of a liberal spirit, undergoing rebuke for undue "leniency." Cotton, too, arriving somewhat later, was by nature as we have said, broad-minded. But the experiences of Massachusetts Bay soon discouraged a tolerant policy. However much we may admire Roger Williams, his words and deeds were often of a kind to startle people of steady habits, anxious for a quiet, well-ordered society while they clung precariously to the edge of the new continent. When a little later the Hutchinsonian excitement began, however much the prophetess may call out our pity and sympathy, no careful student of the time will judge otherwise than that the crisis was appalling. When men like John Underhill, the successful soldier of the colony, claiming to be a "subject of grace," gave himself up to libertinage, such excesses as those of Munster seemed not far off. When in the Pequot war, with a blotting-out of the colonies imminent, the Boston contingent, an important part of the forces, refused to march because the chaplain, John Wilson, was "under a covenant of works," it was only reasonable to ask how under such conditions the English hold could endure. Inevitably the disposition toward toleration grew feeble, giving way to the con-

viction that, if the colony was to stand, there must be greater rigidity in both church and state. Hence it came about that what Dr. Dexter calls a "presbyterianized congregationalism" set in in place of the freedom to which the wiser leaders at first inclined. Plymouth, not populous and in a way remote, felt the strain less; the tradition of spiritual freedom, moreover, was deeper and stronger there; it remained liberal. Liberal, too, remained Rhode Island, which was only, in fact, the asylum of the Massachusetts recalcitrants; and also Providence, though it ought not to be lost sight of that there were bounds even to the tolerance of Roger Williams.

Turning now to Old England, the development was widely different. Browneism, long submerged, working its way among humble people with little recognition from the scholarly and high placed, found at last authoritative statement, a setting forth which gave it prestige and respectability; and the champion was no other than John Cotton (Masson's "Milton," II, 598), in his earlier time the ecclesiastical light of the Eastern Counties, and now the dominating personality of the New England Church. No one will contend that he was consistent. He vacillated; in the strait into which he came he did violence to his natural disposition and went back upon his earlier professions; for democracy in church or state he never had a kind word. Nevertheless in the "Way of the Churches" and "The Keys" (the ideas in these tracts we may suppose were in his mind during his intimacy with Vane) he distinctly enunciated an order in which certainly neither prelate nor synod had part, each congregation, after the Browneist fashion, being left to determine for itself what it should believe and practise. Tho books appeared at the critical moment. The writer was in a distant wilderness, but they went far and wide throughout agitated England, and we have the testimony of the great independent divines how powerfully they were themselves affected by them, and how far the tracts contributed to crystallize and make potent the ideas at the basis of the then nascent Commonwealth.

The return tide from New England to the old home was strong. While immigrants poured westward, there was always a reflex stream eastward, and in the stream went many men of force and education whom it was a misfortune for the colony to lose. Most of the first Harvard class, of 1642, found their careers in the Old World, an illustration of the strength of the attraction exercised by Europe upon the more intelligent young men. While in one way the drain was calamitous, in another it was for the best, for it is quite certain that far the larger part of this New England reflux engaged in the effort to establish that construction in which the Anglo-Saxon race has especial reason to take pride, the English Commonwealth. A few New England men, no doubt, found Presbyterianism more congenial, of whom Thomas Weld was a type; but far the larger number, however balked in its development the Independency might be from which they had come, upheld the Root and Branch, fought with the Ironsides, and helped to break the power of crown, bishop, and synod.

To glance at a few figures of especial significance among these returning New Englanders, first comes Henry Vane, whose early inclination toward Independency we persist in believing, with all due deference to Dr. King, was defined and confirmed by his training during his Boston sojourn in John Cotton's study. He was in the head and front of the leadership which achieved among such trials the great result. A man of great influence, too, was Hugh Peter, who, however he may at one time have disclaimed Independency, as Dr. King shows, became in a new environment perhaps the most extreme type of the idea he had once rejected, the especial *bête noire* of Cavalier and Covenanter, whether he preached or headed a squadron of Ironsides or sat at the ear of Cromwell as the most radical of counsellors, until at last he was tortured to death by his foes in a martyrdom whose details must not be given for modern readers. A soul of even purer zeal and devotedness was Roger Williams, who sped back and forth across the Atlantic, and was scarcely less a power in Old England than in New. In particular his "Bloudy Tenent" established toleration as a cardinal principle of the Independent creed. In the same company must be reckoned George Downing, nephew of John Winthrop, a Harvard alumnus of 1642. Beginning his English career as chaplain of Okey's regiment in the New Model, he soon became an active soldier, rising, until at last as "scoutmaster-general" he became the eye of the army; later he was not less capable in the field of Cromwellian diplomacy. He fell at last under a cloud, adhering to the Stuart after the Restoration, and while he feathered well his own nest, betraying his old comrades to suffer as traitors and regicides. For long George Downing ran well, though sadly hindered at the end from winning the race.

Such were the leaders; men of lesser note following numerously, the reflex stream from New England recruiting and invigorating essentially the forces of Independency. There are good historical grounds for saying that the idea was first authoritatively formulated in John Cotton's study, in which Henry Vane, the boy Governor, underwent a useful training, and that the popular voice in England did not go wide of the truth when it spoke of Independency as the "New England way."

JAMES K. HOSMER.

St. Paul, Minn., June 25.

THE BACON ACROSTIC.

To the Editor of The Nation:

Sir: I have been following with an interest perhaps disproportionate to its real value in affairs in general, this latest Bacon acrostic. It is the "curiousest"—as Alice would say—puzzle that I have ever met with. Here is a variation of the old numerical "string" cipher, used, apparently, as an identification mark for keeping Bacon's name in Shakespeare's works.

There are some—and your columns have already given them expression—who consider the acrostics to be accidents. So did I at first. A friend of mine, however, a mathematical professor, examined Mr. Booth's book for me, and showed me, on a scientific basis, how such a thing was, in the present case, impossible. One acrostic found in an indifferent place in a book—such as Gray's "Elegy," with which Bacon could have had nothing to do, is not significant. The problem in Mr. Booth's book is this: Can a series of similar acrostics recurring on first and last pages throughout a single set of writings be due to chance? It is the duplication, the reduplication, in corresponding and significant places that counts.

Let me relate a personal experience: Having the mathematician's words echoing in my mind, I set to work looking for acrostics. Instead of confining myself to one man's books, however, I took down volumes at random from my shelves, and, applying *all* of Mr. Booth's varieties of the (one) method, sought for "signatures" on *first* pages. Out of over a hundred books thus inspected I got *one* acrostic, better than those which Mr. Rice published in your paper for the 24th. It read Francisco Bacono from the corner of the top line to a central O, and then ran out backwards to a corner F on the last line. It read the same *up*. It read Francis Bacon in the same two directions, keying on a central N. It read Fran as well as Fra Bacon up, but not down. Moreover, it should be repeated, this was only *one* in a hundred first pages, and there was no recurrence in the book—on first and last pages of the chapters.

Calling then the chances of finding an acrostic by accident on first or last pages one in one hundred (and this was by using all the "approaches" that Mr. Booth uses) the chances of finding another, in the same book, in a corresponding place, are two in a hundred squared. Three would mean three in a hundred to the third power, and so on. If there were a hundred, as is the case with the First Folio, the figures are so overwhelming that the veriest Shakespearean—as I once was—must throw up his hands. Of the accuracy of this calculation there can be no question, and I am anxiously waiting for the scholars who understand this problem to tell us what it all means. The literature of the cipher is so little known in this country, however, that we may have to call on Germany to help us out.

W. L. STODDARD.

Boston, Mass., June 25.

[In the interest of fair play we gladly print this letter, though we feel compelled to add that the illustration and the argument seem to us not at all final. That the works, in whole or in part, attributed to Bacon, Shakespeare, Spenser, Marlowe, Puttenham, Bodenham, and Barnfield, were written by a single man, is so repugnant to historical evidence and the most elementary literary sense as to demand proof of an altogether extraordinary sort. Such a cipher, if it exists—and its existence is far from being proved—could only have been inserted by some wanton mystificator. The discussion is not profitable.—Ed. Nation.]

FIFTEENTH CENTURY VERSES IN PRAISE OF PRINTING.

To the Editor of The Nation:

Sir: The correspondence on what we may perhaps call the evolution of Cardelius (see the *Nation* of April 1, May 6, 13, and 27)

has been very amusing. Before the appearance of the illuminating letter of Mr. J. C. Dana I had been much puzzled by the quotation from the pseudo-Cardelius, for I was at the time occupied with a genuine fifteenth century poem in honor of the first printer. It is remarkable that so little was in its early days said of the invention of typography. In ancient times it was the function of poets to celebrate the heroic deeds and skillful achievements of those who contributed to the advancement and prosperity of the tribe or nation to which he belonged. But this was discontinued at an early date, for where is the poem to celebrate the invention of printing? And yet what battle or conquest has had so wonderful an effect on civilization as the art of multiplying books by means of metal type?

The greatness of the invention was, however, not entirely without recognition. In reading Mr. Alfred William Pollard's remarkable monograph on "Colophons" I came across phrases which show that some men had at least a dim sense of the power of the new revolutionary force. But the most elaborate attempt I have seen is in the verses subjoined by Hieronymus Bononius to his edition of the "Orthographia" of Tortellius of Arezzo, sometimes called Jean Aretin, which was issued in 1477. Of the author there is a characteristic notice by Pierre Bayle in his "Dictionnaire." Bononius is known to me only as a name in the British Museum catalogue. The text of his poem begins thus:

Tingere dispositis chartas quicumque metallis
Cœpit: et insigues edidit ære notas
Mercurio genitore satus: genitrice Minerva
Præditus ætherea semine mentis erat. . . .

The whole poem, which extends to thirteen couplets in the original, may be turned thus into modern speech:

THE POEM OF HIERONYMUS BONONIUS IN HONOUR OF THE FIRST PRINTER.

The man who first devised the happy art
With brazen type on paper fair to write,
Was surely son of Hermes, god of skill;
Pallas Athene was his mother wise,
And in him dwelt the spirit of the gods,
Nor Ceres nor yet Bacchus did he love,
And was disdainful of all worldly wealth.

The Latins, eager though they were for books,
Had but a slender store for their delight.
Now goodly books on every side are seen,
Thanks to the man in whose applause we speak;
Now for a trifle books of worth are sold,
Though countless coin they cost in former days,
So greedy were the sellers then of books.
Now Livy's History in the mart is seen;
Virgil and Pliny, Marcus Cicero,
Alike in every grammar school are found.

Such are the happy arts of this our day
No books lie mouldering on forgotten shelves.
Kings only in the past, yea scarce a prince,
The priceless volume could obtain, but now
No man so poor but he may own a book.

Here in this goodly volume, by this art,
The words of wise Tortellius are set forth.
Then buy this book all ye who wish to know
The Latin tongue in all its varied forms.
Buy this and from the skilful master learn
Whenas the double letters must be used.
And when the syllables are short or long.
Master this book, and you will skilful be
In all the use of right and pleasing words.

And you who from this volume shall receive
Pleasure and profit, quick make known to men
By hearty praises all your gratitude.

May Providence forever prosper him,
The pious artist-craftsman, who has made
By his skilful art this ever useful book.

Our poet's testimony as to the change in the cost of literature is very emphatic and useful. But how gladly we would exchange his complimentary phrases about Mercury and Ceres for some homely details about that first printer who had excited the poet's gratitude.

WILLIAM E. A. AXON.

Southport, England, June 28.

Notes.

G. P. Putnam's Sons announce that the fourth volume of the "Cambridge History of English Literature" will appear early in the autumn. It will cover the period from Sir Thomas North to Michael Drayton.

Other publications announced by Putnams for the early autumn are: "A Book of Precious Stones," by Julius Wodiska; "A Quiz Book of Nursing for Teachers and Students," by Amy E. and Tbirza A. Pope; "Biographical Story of the Constitution," by Edward G. Elliott, and "American Inland Waterways," by Herbert Quick.

Another Stuart book is to be issued by the Oxford University Press, dealing in this case with "The Last Days of Charles II," from the point of view of the physician. The author is Dr. Raymond Crawfurd.

From T. Fisher Unwin we learn that a volume containing the Complete Plays of Robert Greene is to be added to the Mermaid Series. The editor is Thomas H. Dickinson of the University of Wisconsin. The series is published in this country by Charles Scribner's Sons.

Longmans, Green & Co. announce the following books for early publication: "Tables and Diagrams of the Thermal Properties of Saturated and Superheated Steam," by Lionel T. Marks and Harvey N. Davis; "Hydraulic Tables and Diagrams for Practical Engineers," by Capt. A. ff. Garrett; "Artificial Manures," by Georges Ville, translated and edited by Sir William Crookes; "The Basis of Ascendancy," by Edgar Gardner Murphy; "Explorers in the New World," by Marion McMurrough Mulhall; "Some Papers of John Francis," from essays and speeches delivered by him, and "Elementary Chemistry," by W. H. Godfrey.

Mme. Gabrielle Sand, granddaughter of George Sand, is dead. She has bequeathed the château at Nohant for an academy, with $20,000 for its maintenance.

"The Love Letters of Famous Poets and Novelists," selected by Lionel Strachey and prefaced with descriptive sketches by Walter Littlefield (The John McBride Co.), is a prettily bound volume containing seventeen groups of amorous correspondence by English, German, French, and American geniuses, with their variously beautified Ophelias. There are philandering epistles by Laurence Sterne expressing the pious hope that, when his inamorata is a widow and he is a widower, they may meet under more auspicious circumstances. There are tragic little sallies of wit and love from Heine lying half blind in Paris and waiting for death. There are frenetic outgushings of sentiment by Victor Hugo. There are romantically idolatrous letters from Poe. Bulwer-Lytton is exhibited in his doddering erotic idiocy. Goethe reveals his sempiternal softness. Keats swoons in ecstasy of passionate expression. Byron betrays the unscrupulous rake. This collection, though it looks like a bible for Daphnis and Chloe, is really a museum of curiosities made up of just those things which the curious public rushes to see, and which the judicious critic declares should be burned. The showmen do not bore us with any tedious historical preamble or moralizing conclusion. They merely inform us, not without a certain zest in the salacious, of such facts as are essential to a lively relish of the object. They make it perfectly plain that when it comes to an affair of the heart a great genius may be as consummate a fool as a grocery clerk. They assemble considerable evidence of the fact that several distinguished men of letters have been very free moral agents. The excerpts from the various writers are so short that one can gain from them no adequate conception of character; but the gossip-loving ear retires satisfied as from an exciting session at seventeen different keyholes.

Like that other traveller, the Lady of the Aroostook, the visitor to Florence "wants to know." He wants more of the human side of the city's story than the standard guides tell him, especially if he outstays the four days assigned by Baedeker. When, for example, all Florence goes hunting crickets in the meadows of the Cascine, he wonders at the association of this *festa del grillo* with Ascension Day, and asks how it represents the "aspiration of youth for love." To meet such needs a class of books which supplement rather than supplant the standard guides has sprung up. To this class belongs, in spite of its pages of "useful information," Signora Elvira Grifi's "Saunterings in Florence," of which R. Bemporad & Son have just issued an enlarged edition. The author shows familiarity with both Italian and English sources, and writes adequately of Florence, and *con amore*, yet briefly, of Florentine heroes and families. The book has so many excellences that one would gladly recommend it as a desirable accession to American librarians, did it not sorely need passing through the hands of a competent English editor, for the sake of added clearness and conciseness and to remove the frequent lapses in grammar and spelling which reappear uncorrected in successive editions.

In "Italian Highways and Byways from a Motor," by Francis Miltoun (L. C. Page & Co.), we are carried through delightful scenes, but the method of conveyance is not calculated to give the traveller more than a superficial impression of the country he is going through. How can it be otherwise? In the space of 370 not over closely printed pages, diversified by Blanche McManus's suggestive illustrations, we are hurried from the Genoa Riviera to Naples by way of Tuscany, around through Romagna to Venice, Lombardy, and back to Piedmont. A motor car can merely speed through—may one say?—the broader byways and allow only a fleeting glimpse at the obvious. At Sermione, for example, we can see all we wish of the Scaligers' fortress, while passing it at the rate of twelve miles an hour, but that most alluring of spots, the villa of Catullus, would require a pause, and with the pause would come the temptation to linger. This temptation Mr.

Miltoun spares us. The book, however, is full of helpful hints, not only regarding by-ways to seek out, but, when these have been sought and found, other directions of a more practical nature concerning distances and inns, garages, and gasolene. It may well be a literal *vade mecum.*

"Motor Tours in Wales and the Border Counties," by Mrs. Rodolph Stawell (L. C. Page & Co.), is written for those who can read it in immediate connection with the same journey, and admirably fulfils its purpose. From Shrewsbury, through North Wales, the Heart of Wales and South Wales to the Valley of the Wye, Mrs. Stawell is a pleasant and observant guide. The motor is not obtrusive and the historical and antiquarian information is clearly and often attractively presented. The general reader will miss a more interpretative estimate of landscape and associations, and will wish that a lurking wit and sentiment had been allowed to develop into distinction of style. But motorists who desire to learn of new tours will be fortunate in the uniformly good taste of this convenient guide book. The photographs used in illustration greatly enhance the brief descriptions of a charming country.

"The Statesman's Year Book" is well on the way toward middle age, the volume for 1909, which has just reached us, being the forty-sixth annual issue. With advancing years it has gathered increase of authority, but also a decided corpulence which the publishers have attempted to counteract by dispensing with the larger type used for a good deal of the explanatory text. By such heroic measures the book, 1,400 pages and more, has been kept down to the moderately chubby size which makes it so comfortable to handle. The ordinary reader will probably hasten to find what this standard British annual has to say on matters connected with the great question of the time, Great Britain versus Germany. A colored insert compares the growth of naval construction in the two countries. A table summarizing the finance and commerce of the principal nations is useful. One error, however, has crept in. When Germany is credited with a per capita revenue of about twelve dollars, as, for instance, against France's twenty dollars, it would seem as if the Kaiser's ministers were quite justified in declaring that the German people are among the most lightly taxed of the nations. The table should have stated that the revenue given is only the German Imperial revenue. Add to that the taxes imposed by the separate States, and the German taxpayer is by no means a subject for congratulation. Under Turkey we catch the evidently unrevised statement that "the will of the Sultan is absolute," etc. That is no longer so, as the text goes on to show. Under New York, the State census of 1905 is not referred to. These are, perhaps, minor blemishes in a handbook of very large and recognized usefulness.

"Qui Êtes-vous?" the French Who's Who for 1909-1910, comes to us from Lemcke & Buechner. We note that an appendix of some thirty-nine pages has been added, giving the regular biographical information about a number of *Étrangers.* This will add to the usefulness of the book. We must say, however, that continual reference to the preceding volume during the past year has shown that the list of home names does not do for France what "Wer Ist's" does for Germany and the two "Who's Whos" do for England and America. "Qui Êtes-vous?" should be enlarged to double its size by the inclusion of the many minor celebrities now omitted.

The standard set by the earlier volumes of "The Catholic Encyclopædia" (Robert Appleton Co.) is fully maintained in the present (fifth) volume. The fear has been expressed in many quarters that the controversy over Modernism might affect the work unfavorably, interfering with its scientific character and compelling the editors to give it a more exclusively traditional tone or to suspend publication. The fear has thus far proved groundless. Volume V, which, like its predecessors, carries the ecclesiastical *imprimatur,* continues to show the same breadth and fairness of treatment, and the same desire to make its readers acquainted with the results of the best modern scholarship. The article on the Old-Catholic Professor Doellinger, where if anywhere in a Roman Catholic dictionary the polemic spirit might be expected to manifest itself, is on the whole remarkably sympathetic and appreciative, though the author's own personal attitude on the issue raised by the Vatican Council is revealed clearly enough toward the close, when he says that Doellinger "weakly yielded to the pressure of those who were bent on apostasy"—a rather unhappy characterization of the motives of the men who could not accept the dogma of Papal infallibility! Among the more elaborate and notable articles are those on Discipline, Dispensation, Divorce, Dublin, Eastern Churches, Ecclesiastical Art, Education, England, and Egypt. Evolution is treated with intelligence, though the evolutionary hypothesis is rejected as not proven. The articles on early Christian writings are critical and fully up to date, as for instance the one on the Pseudo-Dionysius. The interesting article on Doctors gives a useful list of the titles applied to the mediæval Doctors in Theology—Acutus, Angelicus, Ecstaticus, Subtilis, etc., and that on Doctrine, which deals chiefly with the subject of catechetics, contains much convenient and valuable information concerning Roman Catholic catechisms. On the other hand the insertion of a portrait of the Philadelphia banker, F. A. Drexel, one of the few portraits in the volume, seems rather unnecessary, and is to be regretted as decidedly out of keeping with the dignity and general character of the work.

The Gibb Trustees have also undertaken the publication of Ibn Miskawayh's history, "The Book of the Vicissitudes of Nations and the Results of Efforts." The only known complete copy of this work was discovered in 1906 by Dr. Horovitz in the library of the mosque of St. Sophia, while making researches in the libraries of Constantinople on behalf of Leone Caetani, Principe di Teano. The manuscript has been reproduced in facsimile, and the first volume has now appeared (Leyden: Brill; London: Luzac), with a preface and a summary by the prince; this volume brings the history down to A. H. 37 (A. D. 658). Ibn Miskawayh (eleventh century of our era) is remarkable among Moslem writers for the almost modern character of his conception of historical writing. He regards it not, as his contemporaries do, as an undiscriminating citation of facts, legends, and gossip, but as an organic structure, whose details must be verified. He suppresses the legendary and the miraculous, passes briefly over Mohammed's prophetic mission, but gives the Sassanian history at length—this last fact is explained in part by his position as treasurer to the Persian Buwayhid Sultan Adud-ad-dawlah. A note gives what is known of the historian's life. The whole work is to comprise six volumes.

A. C. Hollis, to whom we owe an excellent book on the Masai, now gives us an equally excellent study of the Nandi (New York: Henry Frowde). These people, living in the British East African Protectorate, north of Lake Victoria, belong in a group of tribes that resemble one another in ideas and institutions, and differ markedly from the Bantu. The Nandi, formerly nomadic but now agricultural, appear to be clearly related to the Masai; a noteworthy fact is that the Nandi magicians are descended from a Masai clan. The principal magician is the supreme political head; the young warriors are organized as a separate body. Worship is paid to the sun and to the dead, and spirits good and bad are recognized; it is, however, a mistake to say (as our author does) that they have a supreme deity and a "devil." Circumcision is performed on both sexes. Sexual license prevails before marriage, but after marriage the relations between the sexes are carefully guarded. Mr. Hollis gives a number of myths, folk-tales, and proverbs, and a full sketch of the grammar; the most noticeable morphological feature is the elaborate structure of the verb, in which distinctions of time are clearly expressed. Sir Charles Eliot, the well-known traveller and student of Oriental peoples, contributes an introduction, in which he discusses the institutions of the Nandi and the related tribes, with a comparative study of the languages of a considerable group—an interesting contribution to the linguistic history of this little-known region. The question of the possible Semitic origin of the Nandi has been raised; Sir Charles properly holds that the available evidence does not favor the supposition of such an origin. In fact, the character of the verb-forms is distinctly non-Semitic. Mr. Hollis does not offer his work as exhaustive, and it is to be hoped that he will continue his investigations.

It is worth while recalling the existence and indicating the progress of the giant "Bibliographie des travaux historiques et archéologiques publiés par les Sociétés Savantes de la France," prepared under government auspices by Robert de Lasteyrie of the Institut, with the aid of Alexandre Vidier, sub-librarian of the Bibliothèque Nationale. The third fascicle (Nos. 95,413 to 100,817) of the fifth volume has appeared (double-column, pages 401 to 600, Leroux). The eighteenth series (Fiches, 1701 to 1800) of the "Répertoire bibliographique des sciences mathématiques" is also published (Gauthiers-Villars).

"L'Année Internationale—politique—ouvrière," by F. Challaye, P. G. La Chesnais, and A. Thomas, begins its first year with 1908 (Pages Libres). The nineteenth year (1908) of "L'Année philosophique" is still directed by F. Pillon, its founder, along

with Renouvier. Besides the valuable French philosophical bibliography of the year, it contains four essays (Alcan). Dr. Georges Bohn publishes in a compact volume "La Naissance de l'intelligence" (Flammarion), with forty figures to illustrate the text from the natural science to which philosophy now stoops.

H. Ollion, professor at Lyons, gives a small volume to "Notes sur la correspondance de John Locke," with thirty-two unpublished letters of the English philosopher to Thoynard, written during the years 1678 to 1681 (A. Picard et fils). Georges Deherme, who has shown original thought in his sociological experiments, has written a book with a strong personal flavor, "Auguste Comte et son œuvre" (Giard).

Paul Mantoux, who has already published scientific studies of English social organization, in "À travers l'Angleterre contemporaine," treats of English opinion and the South African war, the organization of the Labor party, and political evolution (Alcan).

The Fratelli Treves of Milan publish a series of essays by Prof. Luigi Luzzatti of the House of Deputies entitled "Libertà di Coscienza e di Scienza," which, while examining the relations between church and state, historically and constitutionally, reflect the attitude of the most liberal minds in Italy alike towards clericalism and anti-clericalism, "the product of the same moral deformity, intolerance," and at the same time reveal the attitude of the leaders in church, government, and anti-clerical circles towards these minds.

The death, in his fifty-seventh year, is announced of John Joseph Jennings, a well-known newspaper man of St. Louis and New York. He has to his credit two books: "Theatrical and Circus Life" (1882) and "Widow Magoogin" (1900).

Clement Lawrence Smith, professor of Latin at Harvard from 1883 to 1904, and dean of the college from 1882 to 1891, has died in Cambridge, Mass., at the age of sixty-five. He graduated at Haverford College in 1860 and taught at that college before going to Göttingen. On returning from Germany he held the position of professor of Greek and German in Swarthmore College for one year, and then, in 1870, went to Harvard as tutor of Latin. Besides contributions to philological journals, his chief publication was an edition of the "Odes and Epodes of Horace."

Henry Hardwicke, formerly a leading criminal lawyer of New York, has died at the age of forty-seven. He wrote five books: "The Art of Winning Cases," "The Art of Living Long and Happily," "History of Oratory and Orators," "The Art of Rising in the World," and "The Art of Getting Rich."

The death is announced of Learmont Drysdale in his forty-third year. Mr. Drysdale, who belonged to the younger school of Scottish composers, was head professor of composition in the Glasgow Athenæum School of Music. He first came into prominence by winning a prize of thirty guineas for his overture "Tam o' Shanter." At the time of his death he had practically completed the score of a grand opera for which the Duke of Argyll had written the libretto.

The death is reported, in his fifty-third year, of Giuseppe Martucci, director of the Royal Conservatory in Naples since 1902. He wrote two symphonies, a number of pianoforte concertos, and much chamber music.

OUR WATERWAYS.

The Great Lakes: The Vessels that Plough Them; Their Owners, Their Sailors and Their Cargoes, together with a Brief History of Our Inland Seas. By James Oliver Curwood. 72 illustrations and a map. New York: G. P. Putnam's Sons. $3.50 net.

The Story of the Great Lakes. By Edward Channing, Professor of History in Harvard University, and Marion Florence Lansing, Editor of the "Open Road Library." With maps and illustrations. New York: The Macmillan Co. $1.50 net.

Old Times on the Upper Mississippi: The Recollections of a Steamboat Pilot from 1854 to 1863. By George Byron Merrick. Cleveland: The Arthur H. Clark Co. $3.50 net.

Mr. Curwood's volume belongs to the American Waterways Series, the scope of which has been indicated by previous reviews in these columns. The facts of the lake freight traffic which he has here presented are doubtless in great part new to most Americans possessing no immediate financial interest in the subject, and are of unquestionable value to students who wish an accurate grasp of the main features of our present material development, and of its probable trend in the future. The more unconcerned reader, however, may be pardoned for tiring a little of the insistence with which the material magnitude of everything connected with the Great Lakes is thrust upon him by the author, who seems deliberately to prefer the tone of the professional promoter. One is continually meeting the city where in 1907 "was built more tonnage than in any other city of the United States," the "richest country on the face of the earth," the "greatest freight traffic road in existence," the "greatest waterway of commerce in the world," until even the adult head is in a whirl comparable only to that of the boy on his first visit to the wonderland of a Barnum and Bailey. The boy who starts down at the bottom and rises to do things is much in evidence—the two who began in overalls and grease, pulling and heaving with common laborers until they stand to-day "monuments to courage and ambition, the earth's two greatest builders of ships"; the poor ten-hour-a-day mechanic of a few years since, "whose word is now law in the directing of more than a hundred vessels, the greatest fleet in the world"; the president of five steamship companies who began as a messenger-boy at Lansing, Michigan, "with just two assets: his clothes and his ambition"—and many another. One could wish that there had been less insistence upon such matters as these and somewhat more of detailed description of the methods by which some of the results of our lake traffic are secured. The pen and camera together might have given, for instance, a fairly complete and clear idea of the development of loading and unloading devices, a triumph of mechanical ingenuity, the extent and importance of which is one of the first things to impress itself upon the mind of the traveller on lake waters.

The pages given by Mr. Curwood to the earlier history of the lake region are too hurried and subordinate to bear comparison with the second volume before us, in which the historical motive is, of course, foremost. Professor Channing divides his work into three parts: Discovery and Exploration, the Struggle for Possession, and Occupation and Development; in the last of which we get in more subdued light the main features of that material growth to which Mr. Curwood's volume is devoted. The main features of the story have been often told, but the grouping of the facts about the great bodies of water which so often gave them their character had never been systematically done, and was well worth the doing. Many readers who have already made the discovery that a number of statesmen of high ability and usefulness were thrown into undeserved obscurity by the brilliant light of the Websters and Clays of the first half of the last century, will appreciate the justice done in this volume to the services of Lewis Cass, as Governor of the Michigan territory during the critical years subsequent to the War of 1812. Though born in New Hampshire, Cass was a frontiersman by early training, and held the first certificate of admission to the bar granted by the new State of Ohio, dated in 1802. He knew the Indians, and in his dealings with them never lost that sense of justice which so many apparently regard as applicable only to men of like skin. Many treaties were negotiated by him during this period of reorganization, always with insistence upon three points: The chiefs should understand fully the purport of the treaties to which their assent was asked; concessions received from them should in all cases have fair remuneration, and the agreements entered into should be faithfully kept by both sides. "The flag that he carried into the lake region remained during his administration the symbol of justice and honor, and won the respect of all."

Mr. Merrick's title, "Old Times on the Mississippi," naturally suggests the somewhat random character of the chapters over which it stands. But even random observations are worth while if the observer knows what to look at, and a river pilot of the old days had perforce to train his eyes to catch what

was really significant. His experience at the wheel lasted less than ten years, but it came when the development of railway building had not as yet cut deeply into the rich profits which the business of steamboating drew from the rapid occupation of the lands of the river valleys of the Middle West, nor had the spice of variety and danger been removed by the clearing of snags and wrecks, the dredging of bars, the straightening of channels, the maintenance of lights, and other aids devised by a generation of experience in river improvement at government expense. Mr. Merrick, therefore, has many a story of absorbing interest to tell, and he does not hesitate occasionally to put into four or five pages material which a more practised hand and a keener eye for the market would have been tempted to expand into twenty. It is a good book for any one to pick up for a half-hour of recreation, but it is still more than that to any reader who would realize the life of our Western rivers a half-century ago, when mere human ingenuity, without scientific training, was meeting and mastering a class of problems of enormous difficulty, now removed and all but forgotten.

CURRENT FICTION.

The Romance of a Plain Man. By Ellen Glasgow. New York: The Macmillan Co.

The story of this book needs a special charm to make one overlook its triteness—to forget would be impossible. In brief, it is the rise of a man who works up from absolute destitution to spectacular wealth, and marries a girl of refinement and high social position. Her family in outraged pride disown her, and her husband, pursuing the Business to the neglect of the Dream, drives her in loneliness to lean almost to scandal on the tender consideration of a rejected but constant lover. The husband is ruined, and falls ill; Sally does fine laundering to maintain the family, and there is a brief interlude devoted to the Dream. But with Ben's returning to strength, the Business regains the ascendency, and he recovers his fortune only to find at last that he has tried Sally's faithful heart too far and that her sweet and dutiful affection can never be rekindled even by the sacrifice of his ultimate ambition, which, knowing this, he makes silently, in expiation, not in hope.

As with the greater number of Miss Glasgow's books, the plot is only a thread whereon are held up for our delectation single characters as carefully and intricately cut as Chinese beads. There is a fine distinction in the brief but suggestive picture of the hero's mother; in the more exhaustive presentation of the General, the "gay old bird," all whose faults cannot wholly belittle his inner greatness; and of those two gentle daughters of Pooh Bah, the conservative Miss Mitty and the radical Miss Matoaca, united only by sisterly love and "family pride." Miss Matoaca indeed impinges sensibly upon the issues of to-day. As she marches with her suffragist banner, "her eyes on the sky and her feet in the dust," one is reminded of modern instances of the pathetic incongruity of the real with the ideal; while in the General's naïve outburst, "I tell you there's not a woman alive that ain't happier with a bad husband than with none at all. What business has a lady got with a view anyway?"—one catches the crude essence of the spirit that, homœopathically, to be sure, is still prescribed for the health of the body social. The plain man himself is so living and human that one involuntarily compares him with other figures of fiction. The story as a whole has a haunting flavor of "Lewis Rand," and readers of the two books will find it an interesting diversion to note the startlingly frequent points of similarity. The resemblance, however, is kept well this side of the danger-line by the subtle individuality of the writer, which invests the most hackneyed themes with a touch of her own originality.

Stickeen. By John Muir. Boston: Houghton Mifflin Co.

We have had no American "nature-writer" of quite the quality which has distinguished that indomitable patriarch of the wilderness, John Muir. Mr. Burroughs is of the farm, the domesticated countryside; he is the balladist, as Bradford Torrey may be called the sonneteer, of wild life in the dooryard. Thoreau at his most savage was within hail of the pencil-market and his mother's kitchen-garden. Professor Van Dyke has studied the desert wastes as he has studied pictures or economic conditions—as a series of interesting, even exciting, phenomena, worth the consideration of sensitive and sophisticated town-dwellers. But John Muir, with a full equipment of city lore, has written in terms of home-felt enthusiasm about the wilderness, that stupendous far-western wilderness, which is (to so many whose daily walk hugs the Eastern seaboard, and whose daily gaze turns instinctively yet farther eastward) but the shadow of a name.

This little story of a man, a dog, a storm, and a glacier, is full of the glamour that belongs to the heroic-in-little. Hop o' my Thumb was a great boy because he was such a little one; and Stickeen, the least and most nondescript of all dog-kind, triumphs for similar cause. And yet far more than that: Stickeen is a tiny but vital atom pitted against a vast conspiracy of inorganic forces. He recognizes the odds, yet, at the summons of his fellow-atom, man, dares the impossible—and wins. There is an epical suggestion in this, as in other episodes recounted by Mr. Muir, which reduces to their right proportions, for the moment at least, those anecdotes of street, shop, or parlor with which our magazines, and daily lives, are filled.

Young Nemesis. By Frank T. Bullen. New York: E. P. Dutton & Co.

Mr. Bullen is straying further and further from the excellence which Kipling discerned in "The Cruise of the Cachalot," and which a large audience recognized in one or two later books. His early catches were excellent, and to all appearances he is now able to dispose of pretty much anything that happens to find its way into his net, seaweed, rubbish, and all. The number of his books has already passed the score, and it must be confessed that most of the later ones are pretty bad—none quite so bad, perhaps, as the latest of all.

"Young Nemesis" is a really ludicrous performance; a tract aimed at that pirate-worship which is implanted in all normal youthful breasts. Mr. Bullen has taken it into his head that the world is laboring under a damnable delusion with regard to the real nature of pirates, and here sets himself to demolish those false idols. Piracy is a monster of frightful mien, and he proposes to picture it to us down to the last horrid lineament. The result is one of the most bloodthirsty books on record, which we cheerfully recommend to all good lovers of pirate lore. But, of course, there needs no able writer to invest such villany with glamour. We greatly prefer the pirates in this book to the young prig of an avenger whom Mr. Bullen has set up against them, and we do not see why it is not more fun to be bloodthirsty at the expense of virtue than of vice, which is sadly remote from the lives of most of us. If details like the Ten Commandments are going to be considered, Mr. Bullen might as well take our giants and our ogres away from us, and be done with it.

Salvator. By Percival Gibbon. New York: Doubleday, Page & Co.

Arms and the Man, Mr. Gibbon sings; a man's life flung into the bottomless pit of devotion to a chimera. Salvator, the hero, is a gallant, vividly colored figure against the background of plain, honest, common-sense people who seem somehow hopelessly stodgy and self-centred by contrast with the fanatical idealist. He is bent upon the regeneration of Mozambique, and to this visionary life-work he sacrifices his love for an English girl—a part of the Background aforesaid—and finally his

life as well, for he is shot by a traitor in the moment when his revolution is declared. As a story of adventure the book would be commonplace and lacking in artistic finish; but its appeal goes below the surface. The writer has wisely kept his central idea so prominent that the eternal strife of the ideal and the practically expedient dwarfs the mere narrative. Reason admits the unanswerable character of all the solid arguments of the Background, and yet—where would this world be now without the flaming efforts of those divine fools who have filled up so many quagmires by what seemed the useless throwing away of life?

Poetical Works of Giles and Phineas Fletcher. Edited by Frederick S. Boas. Vol. II (Cambridge English Classics). New York: G. P. Putnam's Sons. $1.50 net.

This second volume contains an exact reprint of the poems, original or translated, of Phineas Fletcher, which appeared in or after the year 1633, together with "Brittain's Ida," first published in 1628. The earlier work of Phineas, together with all the poems of Giles, made up the first volume. It is unnecessary to repeat the commendation of Mr. Boas's care in carrying through this difficult task. How needful such care was any one may learn for himself by comparing a few pages of "The Purple Island" in the present volume with the text of that poem as printed by Grosart. Our commendation of the editor's labor is the warmer for a reason which Mr. Boas would probably repudiate—that it is expended on one of the most unrewarding poems of the language. Phineas evidently thought himself, as indeed he was called by Francis Quarles, "the Spencer of this age"; and in so far as he possessed to an exaggerated degree all the faults of his model, the characterization is just. It would be a fairly amusing diversion to compare "The Purple Island" with "The Faerie Queene," II, ix, of which it is a monstrous expansion, so to speak, and show how Spenser's passion for allegory, which only his great genius could save from tedium, becomes in Fletcher's hands not only tedious but endlessly absurd; and how, not content with rendering Spenser's allegory grotesque, he must lug in a would-be Spenserian pastoral theme with which the allegory has no natural connection. It is well to speak the truth bluntly about "The Purple Island," for since Lamb's day an utterly false value has been attached to the productions of the minor Elizabethans, or Jacobeans—among them to this dreariest work of the Fletchers. As a matter of fact, if Phineas is ever great, it is not when he is imitating Spenser, but, as it were, preluding Milton. His true genius lay not in suavity or beauty, but in a kind of impulsive crude sublimity. There are passages in "The Apollyonists" which must have been in the mind of the author of "Paradise Lost" when he portrayed the rebel Satan, and which possess an indisputable, if formless, grandeur of their own.

The total absence of warm beauty and genuine sensuous charm from Phineas Fletcher's work makes it difficult to follow Mr. Boas in attributing to him "Brittain's Ida," which is included in this volume. That poem, it is well known, was published in 1628 as a posthumous work of Spenser's. In 1762, Thomas Warton, in his "Observations on the Fairy Queen," after rejecting Spenser's authorship on internal grounds, observed that "It's (*sic*) manner is like that of Fletcher's 'Purple Island.'" This conjecture was taken up by others, particularly by Grosart, but has of late years not found general favor. Mr. Boas now attempts to confirm it by the comparison of a number of lines in "Brittain's Ida" with passages from the undoubted poems of Phineas. As for Warton's suggestion, any one who can see a similarity of manner in "The Purple Island" and "Brittain's Ida" has a sharpness of vision to which the present reviewer lays no claim. "Brittain's Ida" is a copy of Shakespeare's "Venus and Adonis," whose theme it takes, with a sensuous charm, rather pale, but very genuine, which to the rich glow of Shakespeare is as the moon to the sun. Of charm or appeal to the senses, there is nothing in "The Purple Island," and but the faintest glimmer, or semblance, in the other poems of Phineas, whose theme would naturally lead to such qualities. The verbal parallels pointed out by Mr. Boas, if they mean anything, would indicate, not identity of authorship, but that Phineas thought "Brittain's Ida" to be Spenser's, and borrowed language from it for his amorous poems as he had borrowed images, and even words, from "The Faerie Queene" for his allegorical "Purple Island." The parallel passages noted by Mr. Boas could not, in the judgment of the present reviewer, have been written by the same man. To take an example, Mr. Boas quotes from the "Piscatorie Eclogues" of Phineas:

> So is my love an heav'n; her hair a night:
> Her shining forehead *Dian's* silver light:
> Her eyes the starres; their influence delight:
> Her voice the sphears; her cheek *Aurora* bright:
> Her breast the globes, where heav'ns path milkie-white
> Runnes 'twixt those hills: her hand (*Arions* touch)
> As much delights the eye, the care as much.
> Such is my Love, that, but my Love, was never such——

and asks us to believe that these halting lines were composed by the poet who made this stanza of "Brittain's Ida":

> Her spacious fore-head like the clearest Moone,
> Whose full-growne Orbe begins now to be spent,
> Largely display'd in native silver shone,
> Giving wide roome to beauties Regiment,
> Which on the plaine with love tryumphing went:
> Her golden haire a rope of pearle imbraced,
> Which with their dainty threds oft times enlaced,
> Made the eie think the pearle was there in gold inchased.

It is extremely doubtful whether "Brittain's Ida" was really the work of Spenser; from the comparison of two such stanzas as those here quoted it seems to be not at all doubtful that it was the work of a better poet than Phineas Fletcher.

The Love Affairs of Napoleon. Translated from the French of Joseph Turquan, by J. Lewis May, with numerous portraits. New York: John Lane Co. $5 net.

A Favorite of Napoleon: Memoirs of Mademoiselle George. Edited from the original manuscript. By Paul Cheramy. New York: The John McBride Co. $2.50 net.

Like the other books of the author on the women of the Empire and the Restoration, "The Love Affairs of Napoleon" has not the slightest claim to original research. It tells us nothing new, is evidently composed of memoirs of the period, extracts from pamphlets, and stories of scandalous episodes, for several of which M. Turquan does not advance any authority. But the work is decidedly interesting. Several of the anecdotes, and the book is fairly stuffed with them, will find an excuse for their presentation, in spite of their sadly unedifying details, in the light they shed, not only on the social turpitude of the time, but on certain political events. In the pages of M. Turquan, the men and women who surrounded Napoleon are depicted as unspeakably coarse and brutal, with none of the grace and elegance which, in the opinion of the famous Irish orator, palliated the immoral excesses of the ancient régime.

Perhaps the most amusing chapters in the volume are those which treat of Napoleon's relations to Josephine before and after their marriage. It has been said, with some truth, that the Bonapartes belonged to the Renaissance in their morals, views of life, and indifference to all the proprieties. The brothers and sisters of Napoleon, especially the sisters, are shown by M. Turquan to have been as sublimely indifferent to personal morality as were the deities of Olympus. But Napoleon, in his earlier years, loved Josephine with

an affection that was almost disinterested and that lasted for years, in spite of her extravagance, frivolity, and numerous infidelities. There is something pathetic, as well as comical, in the narrative of his courtship of the Beauharnais. The eagle-eyed warrior, the future despot, shows himself on this occasion as weak as a schoolboy. The whole affair is an illustration of the cynical maxim that in love, there is one who loves and one who consents to be loved. Josephine consented to be loved, and she made no secret of the fact among her intimates that her youthful suitor was perfectly indifferent to her, and that she married him in the hope of being relieved from her monetary embarrassments. Then when the divorce came, her anger and despair passed all bounds. There is no doubt that she began to experience at this period as strong a passion for Napoleon as that with which she had once inspired him. Some moralist has said that women really love only those who ill-treat them.

One conclusion the reader will deduce from the work of M. Turquan, namely, that not a single one of the women to whom this Corsican sultan deigned to throw the handkerchief had the slightest affection for him—though we fancy that the author might have excepted Madame Walewska and Mademoiselle George from the list. And they were all false to him—Marie Louise and Josephine and all.

M. Cheramy, the grave and venerable president of the Society of the Solicitors of Paris, has deemed it necessary to defend in a long preface his actions in publishing the memoirs of an actress like Mlle. George. The gist of the whole explanation amounts simply to this: In the days when George IV was king, or when Plancus was consul, M. Cheramy was very fond of frequenting the society of actors and actresses; now that he is retiring from public life, he is returning to his *premiers amours*. But no apology was necessary. M. Cheramy is a Frenchman, and a Frenchman never grows old.

Mlle. Weymer, who assumed the name of Mlle. George, was born in 1787. Her father led a little wandering troupe of actors through the French villages, and was, in fact, what we would call a barnstormer. His daughter must have been a precocious young person, for she played comedy, vaudeville, and tragedy at the age of five. She grew up a marvellous beauty, to which circumstance, rather than to her talent, she owed her engagement at the Comédie-Française, when barely sixteen. The next day, the consul saw her, and invited her to a supper at the Tuileries. The liaison lasted from 1802 to 1808. Her memoirs certainly reveal the Emperor in a sympathetic aspect. If we are to believe them, Bonaparte was a tender and thoughtful lover. But like many of her class, she was very good-natured, not vindictive at all, and utterly free from malice. Subsequently, she had a multitude of ardent wooers, embracing kings, princes, authors, diplomats, and even a bishop, Talleyrand. The last of her lovers seems to have been Victor Hugo. M. Cheramy is inclined to consider her at heart a virtuous woman. He contrasts her tranquil and kindly nature with the frenzied and passionate transports of that other lover of Victor Hugo, Marie Dorval, whose correspondence he intends publishing.

Science.

Birds of the World. By Dr. Frank H. Knowlton. New York: Henry Holt & Co. $7 net.

This is the third volume thus far published in Group I of the American Nature Series, the others being Jordan's "Fishes" and Kellogg's "Insects." The predecessors set a very high standard of excellence, which we are glad to see has been well sustained by the present publication. Dr. Knowlton is a palæobotanist in the United States National Museum, so that his success in this ambitious venture into ornithological work is all the more remarkable. He has had the assistance of two well-known ornithologists, Dr. F. A. Lucas, who has contributed a short but able chapter on the anatomy of birds, and Prof. Robert Ridgway, who has acted as general editor of the whole manuscript.

In a single volume of 873 pages the author has succeeded in setting forth in non-technical language the salient facts regarding the birds of the world. Such an undertaking by a naturalist to-day is, of course, largely a matter of compilation. Careful search through the pages shows that Dr. Knowlton has scanned a vast mass of literature and has shown good judgment in the selection of quotations. For example, in the two pages devoted to that strange reptile-like bird, the Hoactzin, we have, first, a well-worded general description of the plumage and structural peculiarities of the bird. Then comes a paragraph from Newton in the "Dictionary of Birds" concerning the remarkable crop, and then long quotations from the "Ibis" by Quelch and from a "National Museum Depot" by Lucas, treating of habits and general ecology. A final paragraph relates to the various opinions of Huxley, Sharpe, and Gadow as to the relationships of this strange creature. The frank way of using direct quotations is admirable.

The general method of arrangement is the conventional one. Five preliminary chapters treat respectively of Birds in General, Anatomy, Geographical Distribution, Migrations, and Classification. These are full, well-balanced accounts, embodying the most recent results obtained by ornithologists. The remaining twenty-one chapters are devoted each to a single order of birds, this treatment making the chapters of very unequal length. The chapter on the elephant-birds (Æpyornithiformes) occupies only two pages, while that on the Passeriformes covers 244 pages. The lowest unit of classification to be covered in detail is the Family; all known groups of this rank being included. Below this, especially in the larger assemblages, only the more typical genera and species are mentioned or described. The Families are marked by sub-headings, and the representative birds by black-faced paragraph titles.

The classification adopted is essentially that of Professor Gadow, modified by the more recent investigations of other ornithologists. Their influence may be illustrated by the rejection of the sub-class Ratitæ, and by the change of name of the genus of our American robin, from Merula to Planesticus. It is scarcely worth while to criticise any linear classification, the necessary sequence of groups written one after another rendering the relationships misleading and erroneous. But it is the best we can devise for written use until some one invents a genealogical diagram utilizing all three planes of space.

A review of the main body of facts shows that the author is conservative in all mooted problems. Both sides of a question are presented, and the more plausible solution is suggested. Beyond this he does not go, as he is avowedly not writing for the advanced ornithologist, but for the average intelligent student of birds who desires general information.

The proof reading and editing have been carefully done, and errors are chiefly those accepted in compilation. For example, on page 337, as regards the South American Trumpeter; the bird does *not* call with its bill widely open; the females *also* share the trumpeting ability; the nest is *not* placed on the ground, and the eggs are *not* bright green. But errors of this sort show only how much we need real field observations on birds. The author, by occasionally admitting our ignorance, stimulates observation on the part of bird students, as, for instance, in the chapter on Migration, where he confesses that the cause of this world-wide phenomenon "still remains without a wholly satisfactory answer." And again, "it may be acknowledged that we do not yet know the winter home of our Chimney Swift, Bank Swallow, and Cliff Swallow."

The black and white illustrations number 236, and with few exceptions are old friends, taken from well-known English, German, and Dutch works. Their average of excellence is rather low, and we could have wished for a new set by some modern artist. The

sixteen colored plates partly make up for this lack. They are from paintings by Miss Mary M. Mitchell of Washington, and are unusually true to life. The surroundings are carefully chosen, and minute attention has been devoted even to the selection of appropriate plants. Thus in the frontispiece, representing the Resplendent Trogon, we have as a background a Mexican composite flower, and the ruin of an Aztec conventional carving of this bird, the deified Quezal of that ancient nation.

A copius index of both common and scientific names adds much value to the work. The most serious drawback to the book is its unwieldy size and its weight of seven and a half pounds.

"A Little Maryland Garden," by Helen Ashe Hays (G. P. Putnam's Sons)), is a chatty and confidential book, well worth reading. When to its charm of style is added that of drawings in neutral tints, and a few remarkably fine illustrations in color, one can see that here is a garden-book above the average. Of course, the reader does not expect to get from the amateur horticulturist much information which is not presented formally in the standard treatises, but he is sure to get some good hints as to what to avoid. It has been asserted, apparently with truth, that the rapid advance in photography has been largely due to the work of amateurs. This class of enthusiasts can always be found ready to try costly experiments and to break over and through conventionalities: whereas the professionals do not care to take great risks. In gardening much the same holds good. New methods are constantly tried either through design or happy accident, and the results are made known without reserve. The writer of these pleasing chapters had known the glories of sky and the profusion of bloom in California, and she brought to her little garden in the East a strong love for many plants, together with numerous dislikes, and even marked antipathies. Columbines are on the black list, although the author had often seen their brilliant colors in the cañons. The pea-shaped flowers of small size are in the same class of unloved blossoms, although she admits the larger sweet-peas to some favor. And wistaria, as well as yellow broom, are tolerated. Coleus she "detests." And ampelopsis is also under the ban. It is always a pleasure when we find that our likes and dislikes are shared by someone who dares to speak out. This writer takes one into her confidence and offers a wide range of choice as to likable and unlikable things. And if sometimes we cannot agree with her preferences, or may even think them unreasonable, at least the statement of her case is generally well put. It is to be noted also that she is one who delights to work with her own hands, and thus has a claim on the sympathy of a large and increasing group of true garden lovers. A curious effect is produced on the printed page by the bold rejection of capitals for generic names: thus hemerocallis, montbretia, tigridia, and forsythia present almost an unclad appearance without their usual large initials; but if this is a step in the direction of employing these words as common names, no good objection can be urged.

The "Absorption Spectra of Solutions," by H. C. Jones and J. A. Anderson (The Carnegie Institution), is a continuation of Professor Jones's work on absorption spectra, which appeared as No. 60 of the Carnegie Publications. It gives results for about 1,200 new and different solutions. Besides publishing the maps of the spectra, an analysis of the bands has been undertaken for the purpose of comparison with Beer's law. This law states that in a simple solution the absorption of light of a given wave-length would be simply proportional to the number of absorbers in the path of the light. The authors find many confirmations of the law, but there are numerous exceptions to be accounted for. For example, in spite of the large amount of work on solutions of cobalt chloride, no adequate explanation of its absorption spectrum is known. In this work, the authors also find an unexpected effect in the appearance of new lines when a little water is added to certain non-aqueous solutions. This fact apparently opens up the question whether a salt forms a compound with the solvent.

"L'Amérique précolombienne" (Rudeval), by Alphonse Gagnon, is a serious essay on origins of civilization in our side of the world (376 pages, 55 illustrations in text). Lieut. Lucien Marc of the Colonial Infantry, in "Le pays Mossi" (Larose), gives one of those geographical reports for which we are indebted to official expeditions of the French in their new colonial empire. It deals with the country and peoples of that central part of Africa which is in the neighborhood of the Niger curve. The book is illustrated from sketches and photographs taken on the spot.

Dr. Daniel John Cunningham, professor of anatomy in the University of Edinburgh since 1903, and dean of the Medical Faculty, has died at the age of forty-nine. His published works include: "Manual of Practical Anatomy," "Monograph on the Marsupials (Challenger Reports)," "Two Cunningham Memoirs in the Royal Irish Academy," "The Microcephalic Brain," and "The Anatomy of Hernia" (with Prof. E. H. Bennett).

Art.

ART EXPERTS ON THE DEFENSIVE.

No lawyer and no judge, we fear, respects the expert witness. His follies and less pardonable vagaries are well understood. But the art expert has on the whole managed to maintain the mystery and dignity of his high calling. We depend on him to tell us when pictures were painted, for example, and who painted them. Your more skeptical collector will buy no work of art without a written guarantee signed and attested by some well-known authority. Even such reactionaries as the gallery directors admit grudgingly to their catalogues the more plausible pronouncements of this pontificate. Yes, the times are distinctly for the art expert.

And yet the other day the profession got a knock that sets the plain man to thinking very hard. In the gallery of Cologne and elsewhere exist a certain number of old pictures, unduly pretty, inconsequential as art, but much extolled by German criticism as the evidences of a strong and independent school of painting on the Lower Rhine. Because documents prove that a certain Meister Wilhelm lived at Cologne towards the end of the fourteenth century, these pictures have been arbitrarily ascribed to him. Well, it turns out that these panels were one and all fraudulently repainted early in the nineteenth century. The restorer had ideas of his own. He not merely improved upon his archaic originals when professing to rejuvenate them, but when the restoration of an intricate bit of decorative background was called for, he took the easier way of painting in his own figures to conceal the damage. What a hundred treatises have with greater or less laudation set down to "Meister Wilhelm," turns out to be the work of a journeyman restorer, whose name even escapes us. Fortunately these repaints are being removed, and under the skilful fingers of Herr Fridt is reappearing the fine old work that was ruthlessly travestied some hundred years ago.

All's well that ends well, but what shall we think of the expertise that consecrated this vandalism, gave it credit as art, found in it the sources of German painting? Can we trust anything any of the experts say until the restorers have gone over all the pictures in all the galleries? As for the plain man, how shall he feel comfortable in any enthusiasm, until he knows what he is looking at? Of what avail are the itinerant interpreter and the very best of stereopticians until we are freed of the horrid doubt that all this rhetoric may apply to the work of some painter chap who flourished yesterday and probably belonged to a union? What's the use, in short, of the expert, and of what possible value can be his judgments?

If the average man argues thus, no one may blame him. And if expertism is for a while put on the defensive, no one need be surprised. Only good will come of a general testing of the accepted theories. But some one will say this was not a question of theory, but of fact. We understand that theories may lead into a realm of moonshine, but an expert is supposed to know whether a painting was done a hundred years ago or four hundred. Well, if all of art criticism and expertise were of a piece with this "Meister Wilhelm" business, we should be quite justified in dismissing the self-styled expert to the limbo of the astrologer and alchemist. But, as a matter of fact, "Meister Wilhelm" is a

very special case, involving many possibilities of illusion that rarely enter into expert judgments.

In the first place, this mare's nest was "made in Germany." Next, it was made when Germany was at her silliest, namely, during the Romantic movement. Accordingly, nearly all the writers on the subject have been consciously or unconsciously dealing, not in art history, but in patriotism. It became a national article of faith to extol the ancient Wilhelm, the predecessor of the Van Eycks. A German critic was as little inclined to inspect injudiciously these panels of the early Cologne School as a devout believer is to challenge the articles of his creed. English, French, and Italian critics have given but casual attention to this mythical master, and it is fair to say that they have seldom accorded him high praise as an artist. Foreign criticism, that is, while depending too indolently upon the Germans for the facts, does not seem to have been far off in its æsthetic judgments. To the credit of the Germans it should be said that they are now destroying "Melster Wilhelm" as unflinchingly as they invented him lightheartedly.

Where personal or patriotic fallacies enter, no expert, and for that matter, no scholar of any sort can be trusted. In our times an obvious forgery of Leonardo da Vinci has passed a number of the greatest specialists, for no better reason than because it once belonged to the critic Giovanni Morelli. Every judgment into which such motives enter is suspect. Perhaps an overhauling of recent art criticism would reveal other cases as absurd as that of Cologne. Yet such a revision would not be a demolition. Happily, the chief results of art historical research are not infected by these sentimentalisms. We may measurably trust the expert when he puts himself seriously in contact with the facts. What we have to fear is some intervening emotion that makes him judge before he really sees. Scholarship implies the elimination of these disquieting idols, and as a scholar the art expert is neither more nor less fallible than the biologist or the historian. The plain man must take the same precautions in every case.

But "Meister Wilhelm," what trouble he has made! If he could have stayed home; but no. Again and again Italian scholars, misled by a sort of generalized prettiness in Meister Wilhelm, have speculated on possible relations between the Cologne School and that of northern Italy. Could Pisanello have been influenced by Meister Wilhelm? Gentile da Fabriano? In the light of recent revelations, evidently not. But the painter who disfigured the old panels of the Canon Wallraf collection, may well have been at Paris, where Napoleon had gathered in Pisanello and eke Gentile. This hint mere journalism gives to art history for what it is worth.

It is not pleasant to have to condemn a book on art by an emeritus professor of the history and criticism of art at Yale University, but we can find little to praise in D. Cady Eaton's "Handbook of Modern French Painting." It gives, indeed, a good deal of information in a handy form, but the text is so carelessly printed as to deprive this information of much of its value. What, for instance, is one to make of the statement that, "according to Diderot," who died in 1784, "Constable's pictures, exhibited in Paris in 1824, produced great excitement," or the other that Raphael Collin was born in 1885 and received a medal of the second class in 1873? Of Professor Eaton's criticism it might be enough to say that he considers Gérard and Horace Vernet among "the greatest of French artists," that he has little sympathy with Ingres, that he prefers Breton to Millet, and is evidently inclined to think Corot the inventor of "an unnatural style that captured the careless eye of the public," which "he worked out fully to the satisfaction of his pocket." One specimen of what the publishers call "illuminating criticism" we will, however, give in full—a well marked, but by no means exceptional, type of his style of comment. Of Lefebvre's "Truth," holding aloft her immemorial symbol, the mirror, he discourses as follows:

> His Vérité has not the ideal grace or poetic beauty of some of his other subjects. She is a nude woman of ample proportions and life-size, standing upright in the bottom of her well. Her right arm, stretched straight up, holds a gleaming incandescent globe. With her left hand she holds the rope with which she ascends and descends. The rope is realistic; the electric globe is very modern; the well looks damp and uncomfortable.

That is all; and anything further on our part is surely unnecessary.

An exceptionally valuable work has been published by Karl W. Hiersemann, Leipzig, entitled "Altorientalisch Teppiche," a continuation on a large scale of the work under the same title which appeared from 1892 to 1896 under the auspices of the Vienna Museum of Art and Industry. The work appears in twenty-five richly colored folio plates, with a descriptive text in German, English, and French. The editor is A. von Scala; the introduction is written by Wilhelm Bode; and the text is by Friedrich Sarre. The edition is limited to 370 numbered copies. The Austrian Cultus Ministerium has granted a liberal sum to defray the expense of publication.

The *Anthropos* brings intelligence of a remarkable discovery, made in the garden of the Trappist monastery in Durban, Natal, recently. This is a bronze coin, yellow in color and containing four Hebrew words, two on each side, these together reading: "Fourth year of the Delivery of Zion," which is by specialists considered as referring to the delivery of Jerusalem by Judas Maccabæus (143-136 B.C.). Similar coins have been found before, but this is the first ever to turn up in Africa. Anthropos declares that two things are facts: (1.) that the coin must have found its way to Natal by sea; and (2.) that its discovery throws an entirely new light on the vexed question as to the origin of the great field of ruins in South Africa. It will be remembered that not a few archæologists now insist that the gold land of Ophir, to which Solomon sent his fleets, was in Southern Africa.

Finance.

The Fourth was flanked by holidays on Saturday and Monday, and the calm surface of the market was hardly marked by a ripple for the week past. The only real exception to the ruling apathy was cotton. The government report of the average condition of cotton was issued at noon on July 2. For the entire cotton belt the average is 74.6 per cent., the lowest record for this date for a period of fifteen years. Cotton jumped at once from 40 to 50 points—about two dollars a bale—and profits were taken on the bulge amidst excitement not paralleled in years. But the activity in this market did not prove contagious in stocks, whose dealers looked on with a rather envious surprise, but quite unmoved. It should not be forgotten that there is still a full month of growing weather for the staple, and that its position differs from that of wheat, in that the left-over stocks of the cereal are not large in comparison with the promised harvest.

The Lackawanna melon was cut on Tuesday last. It carried a 50 per cent. cash dividend for registered holders. The railway has now done formal obeisance to the commodity clause of the Hepburn law by organizing a coal company. The cash dividend was designed apparently to facilitate the railway's shareholders' absorption of the coal company's stock. The coal taken from the D., L. and W.'s properties is to be bought by the coal company at 65 per cent. of the tidewater price. The carrier will carry the freight as heretofore.

While the market mourns the dearth of the speculative customer and the paucity of genuine investment demand, the world of productive industry seems to be quickening its pace. Bank clear-

ings are 38 per cent. more than last year at this time. Imports are on the increase, but this may be in part a rush to evade higher duties. Postal receipts are swelling. The number of idle freight cars is on the decrease. With it all, money is fairly easy. The Treasury's call on the banks for $25 000,000 of government deposits and the export of two millions in gold to Holland and a half million to Argentina produced no appreciable stiffening in loan rates. Compared with the attitude of business men in Great Britain, our industrial leaders seem fairly apathetic as regards the pending corporation tax in Congress. The small investor who is credited with acquiring a little block of stock here and there in the recent rich man's panic is particularly immobile. He is sitting on his holdings very hard, even if he is not able or willing to take any more just at present.

The summary of actual receipts and expenditures in the fiscal year ending June 30 has been issued by the Treasury Department. Owing to the new system of Treasury statements, the deficit is variously estimated. The nominal expenditures, including the redemption of national banknotes, exceed the receipts by $115,000,000. The actual difference between cash received and disbursed is $89,000,000, as compared with a similar deficit of $59,000,000 for the previous fiscal year. But the total cash receipts for the last fiscal year were only a trifle over three millions in excess of those of the year previous, and were sixty millions less than those for 1906-7. The cash expended in the past twelvemonth was $694,000,000, or $37,000,000 more than in 1907-8, and $116,000,000 more than in 1906-7. In other words, while the annual revenue has fallen approximately by sixty millions since the last year of normal trade, annual outlay has increased by nearly one hundred and twenty millions. The expenditure in the War Department alone ran $40,000,000 ahead of last year's. But the idea of necessary retrenchment seems inexplicably to be wholly lacking. Forecasts there are as to whether the Treasury's working cash balance can safely tide it over the midsummer months when outlay is proverbially heavy; or whether Panama bonds or certificates of indebtedness authorized by the Spanish war act of 1898 will have to be issued; but a serious proposal to bring about budgetary equilibrium is conspicuous by its absence.

Darwin and Modern Science

Essays in Commemoration of the Centenary of the Birth of Charles Darwin and of the Fiftieth Anniversary of the Publication of "The Origin of Species." Edited, for the Cambridge Philosophical Society and the Syndics of the University Press, by A. C. SEWARD, Professor of Botany in the University, Honorary Fellow of Emmanuel College. Large Royal 8vo. 609 Pages. 5 Ills. $5 net, Carriage 30 cents.

In the contributions to this memorial volume, some of the authors have more especially concerned themselves with the results achieved by Darwin's own work, while others pass in review the progress of research on lines which, though unknown or but little followed in his day, are the direct outcome of his work.

NEW YORK, THURSDAY, JULY 15, 1909.

The Week.

Four months after the President called an extraordinary session of Congress to revise the tariff, the real work of revision has begun. All that has gone before is merely preliminary; providing the basis upon which the conference committees will do the actual shaping of the final bill. In the nature of the case, Mr. Taft will now be drawn into the affair though he has steadily refused to be down to the present. Others will be the conferrees; he will necessarily be the referee. The Republican leaders cannot be so mad as to pass a bill which they know the President will not sign. That would be party suicide. It is inevitable, therefore, that they will, from time to time, refer disputed schedules to him, as the discussions in conference go on. Indeed, it is an open secret at Washington that the President has prepared himself thus to act as umpire. He has had full tables made of the duties proposed by the Payne bill, as compared with those adopted by the Senate, and will be ready to meet each case as it arises. Mr. Taft has said that he thinks the tariff bill which the House passed to be a fairly reasonable measure, and that, if the further reductions made in the Senate could be embodied in it, he should regard the resulting law as in accord with the pledges of the party and the expectations of the country. The question now is whether he will be able to compel the besotted protectionists to surrender the prey in which they have set their teeth.

The almost unanimous vote by which the House assented to the Senate's joint resolution for a Constitutional amendment authorizing an income tax signifies the strong trend of public feeling in favor of such a measure. The majority apparently are in favor of the project as a regular part of our Federal financial régime. Others, like Mr. Payne, based their support on the sure ground that such a source of revenue may be needed in an emergency. Of the opponents, Mr. McCall made the most strenuous fight on grounds whose present-day validity is extremely doubtful. He referred to the Constitutional provision of direct taxation by apportionment to population as one of the great compromises between the large and small States, consecrated by the Constitution. So it was originally, along with equal representation in the Senate. The repeal of the former provision he pictured as a sort of temptation to the small States with a majority in the Senate to plunder the larger commonwealths. But both as historian and as prophet, he seems in error. The numerical preponderance of the large States in the House forever bars any such hypothetical assault on the large States as he fears. Moreover, it would appear that the linking of direct taxes to population was originally motived by the slave-holding States. A Federal poll tax, if it fell on slaves, would have been a serious burden for the South. By the three-fifths rule applicable to both taxes and representation in the House, the slave States were exempted from paying poll taxes on more than 60 per cent. of the slave population. A similar protection was afforded to States which had vast tracts of land of little value. If land area were made the basis of imposition, such States would suffer more sharply than the other States. The disappearance of slavery made the Constitutional provisions relating to direct taxation practically obsolete.

Attorney-General Wickersham's advocacy of a Federal charter for corporations, in his speech before the State Bar Association of Kentucky, is the revival of an old idea, but with a difference. One difference is that Mr. Wickersham speaks not as a heady reformer in a hurry, but as a cool and sound lawyer. His premises are, not his wishes, but the statutes of States and the nation, and the decisions of the Supreme Court. Another difference is in the changed posture of affairs, both economic and legal. With a Federal tax on corporations now certain to be adopted, involving inspection and a certain measure of control, the argument for national incorporation becomes stronger, and the objections to it fainter. Corporations may in time run to embrace what they long shrank from in terror. The initial difficulty is that of change of status. Creatures of separate States as they now are, the corporations will find it a complicated process to shake off their present obligations, or surrender their existing privileges. But more stringent State regulation confronts them, in any event. The Attorney-General dwelt upon this, and suggested a method by which the device of a holding company might be met. This is to vacate the license of any corporation to do business within a given State, whenever 50 per cent. or more of its capital stock is held by any other corporation, domestic or foreign. Such a law would be, Mr. Wickersham showed, in consonance with doctrines laid down by the Supreme Court, and would, in his opinion, be effective in checking the too rapid growth of monopolies, and in halting monopolies. He did not say, what lies on the surface, that legislation of that kind would more incline the hearts of corporations to seek a Federal charter.

The address of Mr. James B. Forgan of Chicago to the Michigan State Bankers' Convention, last week, sounded a warning as to the banking and currency legislation promised at the next session of Congress. There is a very real danger in devising elaborate, but unworkable powers of inquiry into banks and their condition, and then reposing in a quite unjustifiable confidence upon the law. Mr. Forgan called the Comptroller of the Currency the most powerful man in the financial world—this, presumably, because of his right of inquiry into the condition of any national bank. But he correctly said that in the last resort the responsibility for the honest and capable management of any bank must rest with its own directorate. The bank examiner can satisfy himself as to the presence of the requisite cash reserve. He can assure himself, negatively, that the loans and discounts do not offend against the explicit prohibitions of the statute. But to judge the quality of the assets, where they so largely consist of discounted paper, is beyond the power of any bank examiner, unless he be exceptionally acquainted with the financial condition of the particular locality, or unless he devote himself to a long-continued study of a single institution.

Nothing finer has been urged for a long time than the proposed celebration in 1914 of a century of continuous peace between the United States and Canada. The suggestion is said to have been made at the Harvard Commencement by MacKenzie H. King. The Canadian Premier, Sir Wilfred Laurier, is reported to approve the project very heartily. With a century of peace behind us, we should have good reason for mutual congratulation. It should afford the cause of world-peace an impetus, this notable instance of two neighborly nations with a common boundary line of 3,000 miles without fortifications on either side. It is true that a system of jurisprudence fundamentally similar, and a common language, bind the two peoples together. But whatever abatements may be pleaded, the spectacle is one to be proud of. It is to be hoped that our Government may heartily respond to the invitation for a joint celebration which the Canadian Government will probably extend.

If calling a man "grafter" does not constitute libel, as a Chicago court has ruled, it must be because "graft" by indiscriminate usage has lost so much of its original precision. The law of libel is concerned not with phraseology, but with intent. If a prominent corporation lawyer were to slap a United States Senator on the back and say, "Hello, you blackguard, come and have a drink," it would not be as if he had made use of the epithet after a sharp dispute at a directors' meeting. On the other hand, the courts have held that for a stock-broker to refer to a fellow-broker as a lame duck, while underlining his words with a wink, constituted defamation of character. "Graft" has undoubtedly been a useful term, but useful just because it offered a convenient handle to the lazy man with a dislike for distinctions. The Harrisburg capitol thieves grafted; the contractor who made only the customary overcharge, grafted; the clerk who used the office stationery for his private correspondence, grafted; the maiden aunt from the country who came self-invited for a three months' stay, grafted. Having set up a standard of absolute virtue such as never has been realized on land or sea, we have called everything that wavered a hair's breadth, graft. Thus the term became a substitute for plunder, defalcation, bribery, rebate, allowance, prerogative, perquisite, tip, and favor. That a word of such broad connotation should always carry libel with it, was clearly out of the question.

In the death of Prof. Simon Newcomb, this country lost a distinguished scientist of world-wide reputation. In his own special department of mathematical astronomy, his achievements were both solid and original, and, unlike the work of many scientists, much of Professor Newcomb's was of the greatest direct serviceability, especially in the domain of navigation. The born man of science was in evidence, whether he was journeying to a remote land in quest of observational knowledge, or whether he was calmly pursuing his scientific inquiries in Paris while the window panes of his observatory were rattling under the musketry of the Commune. Like all of the greatest men of science, he was simple, direct, unaffected, never ashamed of admitting the limits of his knowledge. An illustration of this almost naïve quality once came under our notice. He complained of his inability to grade written examination papers. He said he never felt certain that the relative markings he gave were correct. The secular variations and mutual relations of the asteroids, the weight and the orbits of the planets, hid little from his scrutiny. But the elusive windings and spectral emergencies of the human mind he recognized as beyond any precise rule that he could frame. Particularly noticeable was a contribution of his to economics, that of the distinction between "funds" and "flows" of wealth. The whole terminology of modern economics which hinges so much on the difference between income and capital may be regarded as the outcome of this pregnant suggestion. Equally sane was his recent summary of the limited possibilities of aerial navigation.

It is a little surprising—this claptrap that is indulged in by various critics of college education. Not that the colleges are not open to criticism on legitimate grounds, such as administration, curriculum, the organization of extra-academic activities, and the like. But when the indictment is based on the intangible ground that "the moral output" of the college or university is entrusted to nobody in particular, it is time to call a halt. This last charge was uttered by the president of the Religious Education Association, Prof. George Albert Coe, in an address at Chautauqua. The allegation seems to imply that "moral output" is something that can be weighed and measured like sugar or candles, or at least that it can be graduated on some scale of value. Matthew Arnold's "doctor of the soul" could canvass with official breath "the future and the viewless things," but it remains for the practical "religious hustler" of to-day to compile the current statistics of "moral output." The truth is that there is nothing more conducive to "moral output" than insistence upon the student's making proper progress in a well-chosen scheme of intellectual pursuits. Like many other admirable things, moral maturity, in college or outside, comes generally without observation, and the drum and trumpet scheme of an all-too-formal organization of such activities is as apt to retard as to advance the consummation so devoutly to be wished for.

It is reported from New Haven that a higher standard of entrance examinations has resulted in the rejection of 622 candidates out of 900 applicants for admission to the Sheffield Scientific School. It fails to indicate whether the 900 includes only candidates for immediate entrance, or whether it embraces also candidates taking preliminary examinations, with the intention of passing final examinations a year hence. Statistics of college entrance examinations are slippery things for the outsider to handle. A large percentage of applicants admitted may indicate either adequate preparation on the part of the ordinary candidate, or complaisance and lack of rigor on the part of the examiners. The same thing is true of the percentage of admissions with or without conditions. One tolerably good index of the comparative difficulty of college entrance examinations is found in watching the current among the less efficient students in the large preparatory schools. They are quick to discover where it is "easy to get in"; and in the absence of family preferences to the contrary, they try the easier openings. If it is true that candidates admitted to the Sheffield

school are weeded out so that the classes lose one-half of their initial membership in the first two years of the course, a higher standard of entrance requirements would seem to be desirable.

Princess Lwoff-Parlaghy, lately arrived on our shores with the purpose of painting the portraits of the twenty-five greatest Americans, will not immortalize Mr. Rockefeller, the reason she gave being, it is alleged, that "he is too selfish." She apparently does not deny that he is one of our twenty-five greatest men. That she concedes, but she will not paint his portrait because his "progressiveness is for himself only." It is clear that the Princess has never been bitten with the idea of art for art's sake. She does not seek, apparently, the characteristic, but the virtuous. This does her honor, no doubt, as a woman, but her attitude as an artist is revolutionary. Of course, there is a possibility that she is not an artist, and. if this dreadful alternative be true, it is easily understood why she seeks ready-made heroes and heroines of virtue for her subjects: for these are fully formed and fitted in the popular imagination, and do not need the interpretative touch of the artist. Mr. Rockefeller, we imagine, would appeal greatly to an artist, whatever the artist's ideas might be in regard to his influence for good or evil. A searching artistic interpretation of the Standard Oil magnate might throw fresh light on his character. There is a story by Henry James in which, by means of a profoundly interpretative portrait, the hidden villany of a man is shown, for the first time, to a woman who knew him intimately. Thus, even with the best intentions in the world to work for art's sake, the artist may find that he has done a moral act, by bringing out the deeper truth.

The British public, in its recent naval scare, went like a crab, backwards. Alarm began over what might happen to the British fleet in 1913, and ended by making some Englishmen sit up of nights in the year 1909. What will happen in 1913 no one knows, not the experts who have fallen madly afoul of one another, and not the ministers and prime ministers whose personal knowledge of "capital" ships and striking strength is about equal to the average United States Senator's intimate acquaintance with the cotton schedules. What the situation among the world's navies is to-day, has been put into brief compass by the Office of Naval Intelligence at Washington and given to the public. Taking the navies in the order of their ship tonnage, both Dreadnought and pre-Dreadnought, it appears that the old order hath not yet changed into the new. Great Britain is first with 1,669,000 tons; the United States is second with 685,000 tons; France is third with 629,000 tons; Germany is fourth with 525,000 tons, and Japan is fifth with 372,000 tons. After that, expert opinion may perhaps veer around to the belief that the pre-Dreadnoughts are something more than scrap-iron, after all.

The "Chancellor-crisis" in Germany naturally takes up great space in the German newspapers. They do not agree, however, either in their assigning of causes for Prince Bülow's fall, or their reading of the immediate political future. Through all the accounts runs the distinct implication that he had lost the Imperial favor. It was the subtle conviction of this that blew his Parliamentary *bloc* in pieces, and left him a Minister without a majority in the Reichstag. With that combination broken up, it was evident that, as the semi-official North-German *Zeitung* promptly said, the success achieved at the general election of 1907 was at once made "illusory." With the Kaiser stanchly behind him, the Chancellor might have decided on a dissolution of the Reichstag. But neither William II nor Prince Bülow cared to face the hazard of an election so soon, with the practical certainty that the Social-Democrats would make great gains; and, besides, the Emperor made it clear that he was ready for the Chancellor to go. Von Bülow had repeatedly declared in the Reichstag that he should remain in office as long as the Kaiser wished him to do so; and his sudden announcement that he would leave his post as soon as possible, could only be interpreted as an admission that he no longer had the Imperial confidence.

Such royal and personal motives, however, are not enough to account for the Chancellor's retirement. Tney may explain the final push over the brink, but do not show how the edge of the precipice was reached. Von Bülow had been long in power, and upon any statesman of whom that is true, difficulties and resentments accumulate. In Bismarck's famous "dead-tired" speech of 1880, he spoke of the *haines inassouvies* which necessarily hung over him, after eighteen years as Chancellor. Prince Bülow has not the personality to provoke such unappeasable hates as Bismarck stirred in his enemies, yet a growing political hostility has faced the present German Chancellor. The deepest reason for this lies in his failure to have a clear and vigorous policy all these years, and particularly in his lack of sympathy for the classes in Germany that have been rising to wealth and strength, and should have been allowed to rise to political power.

From Teheran comes news to confute the facile philosophers who have sneered at the Orient's make-believe game of constitutionalism. The Nationalist forces have fought their way into the Persian capital, and with the sympathy of the populace entirely on their side, they should have no difficulty in making themselves masters of the situation. The Shah has taken sanctuary in a foreign legation. Thus Moslem Persia has almost repeated the experience of Moslem Turkey. Like the Turks, the people of Teheran conquered a Constitution almost at a blow. A Parliament assembled at Teheran, the Shah repeatedly took oath to the Constitution while plotting for its undoing, and after long hesitation he succeeded, with the aid of a mercenary force under Russian generalship. Here was the time when the East should have shown how really unprepared it is for any other government than despotism. But the Liberal element refused to be discouraged. With Teheran under a reign of terror, Tabriz, the northeast, the entire south, rose in insurrection. When Tabriz was occupied by the Russians, the Nationalist cause flared up all the more brightly in the south. The Shah's hired men have proved too weak to enforce quiet in Teheran and defend it against attack from the outside. The triumph of the Nationalists was foreshadowed in the excommunication of the Shah by the heads of the Shiite faith. Once more it was shown that the religious authority of Sultan or Shah was no very terrible weapon, after all.

INTEREST IN DIRECT PRIMARIES.

Political activity up the State, unlike that in Greater New York, does not wait for the coming of September. Several contests for Assembly and Senate nominations have already been fought out, and others are under way. In all of them, the chief issue is Mr. Hughes's plan of direct primaries. This must astonish those confident gentlemen who had sunk that measure of the Governor's forty fathoms deep, but it is the fact. Indeed, the opponents of Gov. Hughes have found the people so interested in his project that they have made haste, in some counties, to call the party primaries at an unprecedentedly early date, so as to forestall discussion and outwit the advocates of the direct primary. In various parts of the State, as in Chenango County, candidates are announcing themselves in opposition to the choices of the party managers, and are doing it on the Hughes platform. Be their motives selfish or not, their course testifies to the extraordinary hold which the proposal to introduce direct primaries has taken upon the political imagination of the people of New York.

In this fact lies the really strongest reply to such arguments against the direct primary as are advanced by Prof. H. J. Ford, in his article in the July *North American Review*. His trenchant contention practically comes down to this: all political machinery is bad; it leads directly to irresponsibility and graft; therefore, instead of arranging to give the people more to do with primaries and elections, you ought to be planning to give them still less. Professor Ford's view frankly leans to the aristocratic theory of government—we use the word in no invidious sense. He would have as few elected officials as possible, with large powers entrusted to them, and with political machinery and the interference of the electorate reduced to the minimum. This is that idea of heaven-born rulers of men, placed above the crowd, which Lord Salisbury once expounded and which John Morley afterwards attacked with such an array of historic proof, showing what a mess the aristocrats had made of government. Be that as it may, we are in for the democratic movement, think what we will of it. The people are going to participate in their political management, whether we like it or not; and the only questions to ask are how they can be got to do so wisely, and what useful political weapons we can place in their hands.

Professor Ford seems to think that no one can favor direct primaries, unless he can show, or believes, that they will prove a panacea for all our political ills. But Gov. Hughes is under no such illusion. He does not expect to get rid of the boss or the professional politician. What he is aiming at is a wider and more flexible system of party government. Of the new machinery, it may well be true that the skilled practitioners of politics will, in ordinary times, get control. They are in the business year in and year out, so that the average citizen cannot hope to compete with them. Yet the fact will remain that a new possibility of popular assertion, and even, in a pinch, of popular revolution, has been provided. Voters will be able more easily and directly to effect their will, when they really will something very hard. And undoubtedly it is this thought which most sways the people of New York, who are displaying so much interest in the subject of the direct primary. They are not abstract political philosophers. In the mere frame of government, as such, they are not deeply concerned. But they strongly desire to make their political activity more felt and effective; and because they are convinced that Gov. Hughes has pointed out the way to that end, they are supporting him with so much enthusiasm in his plan for reforming party management.

A LIBERAL AND LABOR ALLIANCE.

Last Friday's bye-election in the Cleveland Division of Yorkshire was hailed by the Conservatives as a blow to the Government, because the Liberal majority was cut down one-half. In 1902, the last time this constituency was contested, the Liberal candidate, Mr. Herbert Samuel, received a majority of 2,036; now the figure is reduced to 971. This result may or may not indicate dissatisfaction with the budget, but one thing is certain: the majority would have gone much lower, and might have been wiped out altogether, had not the Independent Labor party decided not to put up a man against Mr. Samuel. And this decision, of course, was due almost wholly to the Labor party's satisfaction with the budget. Indeed, the signs of a closer electoral coöperation, if not tacit alliance, between the Liberals and the Laborites are multiplying, and are causing the Conservatives much uneasiness.

One of them writes to the London *Times* declaring that this "Liberal-Labor" movement means the extinction of the Liberal party. He is particularly distressed by the situation in Mid-Derbyshire, where a bye-election is soon to be held, and where the Liberals have endorsed the Labor candidate, Mr. Hancock. The latter, in his election address, committed himself flatly to free trade, and said that he was "opposed to any return, under whatever guise, to the old and discredited system of protection." This Labor representative also applauded Lloyd-George's budget as "the most democratic and beneficial to the general community ever put forward." As the Liberal majority in this district was more than 3,500 in 1906, the chances of Mr. Hancock's election must be thought excellent. If three candidates had stood, the Conservatives had high hopes of winning the seat. As it is they are exclaiming at the disgrace of the Liberal party in "surrendering seat after seat to 'Liberal-Labor.'"

The thing goes far beyond these scattering bye-elections. It foreshadows an understanding and working agreements between the Liberals and the Labor party in the general election, which cannot be deferred much after next year. If the committees of the two parties are able to arrange it so that nearly all three-cornered contests can be avoided, the task of the Conservatives in winning a majority, independent of the Irish, will be made much harder. As the drift now is, their success seems assured; but the great preponderance to which they have been looking forward, as a basis for a strong and lasting Ministry, will not so easily be attained if the Liberals and Labor party go into the struggle practically as allies. Hence these Tory tears.

Furthermore, this new political combination will have highly important immediate effects. It will make any meddling with the budget by the Lords, much more their throwing out of the finance bill altogether, an exceedingly delicate and dangerous operation. Should such a revolutionary step be ventured by Mr. Balfour and his obedient Peers, the infallible result would be to weld all radical elements indissolubly. The cry would be raised that the Conserva-

tives were merely the party of the landlords and of privilege. And a new and burning issue would be injected into the campaign, the voting upon which no man could predict. All these considerations are plainly giving the Conservative leaders pause. Many among their followers, and several newspaper organs, in their violent denunciation of a "socialistic" and "confiscatory" budget, have been demanding that the House of Lords take its courage in both hands and make an end of the measure entirely, challenging an appeal to the country at once. But Mr. Balfour's cautious Scotch nature does not incline him to such vertiginous policies. During all the debates on the budget in the House of Commons, he has not once intimated that it might be done to death in "another place." And the likelihood is strong that his aversion to such a course will be deepened by the evident preparation of the Liberals and the Independent Labor party to pool their electoral issues.

Unquestionably, Mr. Asquith and Lloyd-George and Winston Churchill are in a position to appeal strongly for Labor support. They have sought to enact a budget which, as the Chancellor of the Exchequer asserted in the Commons, is a war budget—that is, a war for social reform. In addition to making a beginning of special land taxation, which the Labor party has long urged, they have inaugurated the system of old-age pensions, and have besides undertaken, through a system of official Labor Exchanges and in other ways, to grapple with the problem of the unemployed. If gratitude were the most powerful motive in politics, the Liberals might certainly be able to count upon the heartiest kind of support by the Independent Labor party. We know, however, that it is not. Pride, selfishness, greed, the spirit of faction, often show themselves able to lead political man to do what gratitude is too feeble to induce him to attempt; and, in spite of the *rapprochement* now visible, it is not probable that we shall see anything like a real consolidation of Liberals and Laborites, even for one general election.

INDIA AND TERRORISM.

Only three days before the assassination of Lieut.-Col. Wyllie, a special correspondent of the London *Times*, in summing up his researches into the present condition of India, showed himself a prophet and a sage:

> That the anarchist organization will continue to spread and will break forth into fitful outrages is tolerably certain. The anarchists remain a class apart, though they are really only the ultimate expression of a very widespread phase of Indian feeling. Lord Morley is under no illusions about their continued existence, and has repeatedly warned the British public that "bombs are not an end." Alone the anarchists could do little. A Punjab civilian said proudly, "The bomb is not made that could burst the Indian Empire."

The murder of Col. Wyllie came, and British opinion, in spite of early manifestations of rage and panic, has on the whole remained sober in the face of exceptional provocation. The Tory press will probably raise an insincere cry for strong measures in India. The violated sanctity of human life in sea-girt Britain will be insisted upon. But the noise will be made for partisan purposes, since India, like the navy, is no longer outside the sphere of domestic politics in England. At heart, there are few Englishmen of standing who believe that reaction is possible or desirable in India.

We catch this mood in the article on Britain's future in India from which we have quoted. At first sight, the writer is openly in favor of a drastic policy against Indian "sedition." He declares that, so far as British rule in the peninsula is endangered, Lord Morley's reforms have not abated that menace in any material degree, for British rule is disliked, not because it is bad, but because it is foreign. Nearly every experienced administrator in India is against the reforms. If Hindu discontent has recently shown signs of abatement, the reason is found, not in Lord Morley's policy of conciliation, but in "the tardy vigor of the authorities in dealing firmly with the seditious press, and in the wise and discriminating exercise of the salutary power of deportation." As for Britain's general attitude toward India, we find the argument of the mailed fist put forth with engaging frankness. "While we believe our presence in India to be for India's good, we must maintain it against a growing and unappeasable antagonism" And yet, for all his fine frenzy, this writer cannot help revealing his perception that force alone will not avail against a great people awakening to national consciousness and modern ideals. He admits that the Indian official is too prone to say, Do this and it shall be done. The Indian politician's right to speak his mind boldly must be recognized. British policy, administrative or legislative, must be willing to defend and explain itself.

But just how it is possible to reconcile the Indian politician's right "to speak his mind boldly" with "the wise and discriminating exercise of the salutary power of deportation," is hard to see. The danger is that a discontented people may be driven to make use of that "ultimate expression" of its feelings which the Hindu student in London employed against Col. Wyllie. Terrorism as a policy has been repeatedly proven futile, as notably in Russia. Terrorism as a symptom has its value. The isolated act of a Guiteau or a Czolgocz is indicative of nothing but an individual aberration. But in Russia, or in India, the political assassin, even though fanatic or half-insane, is the product of conditions. His act may do more harm than good, as the case usually falls; but only in Russia is it imagined that a nation's ailment can be permanently done away with by hanging the individual in whom the general ill-being rises to fever heat. Common sense, which with the British people rises to genius, must recognize the folly of making terrorism an excuse for reaction. Given the awakening of Asia to the aspirations of Western liberalism, and it is not Britain's army, but such reforms as Lord Morley has "forced"—so we are told—upon the Indian administration, that will shape the future of India with a minimum of riot and political assassination.

REFORMING THE FOURTH.

It should seem, to judge from figures compiled by the Chicago *Tribune*, that our great national holiday has this year, thus far, cost us fifty-two lives. After the same interval of time last year, the death-roll was seventy-two. Thus our attempt at a sane Fourth has saved us twenty lives—a great saving, but not enough. To effect a moral reform, the substitution of a good habit for a bad one is essential. A drunkard could never reform in a moral and æsthetic vacuum. But give him sustained new temperamental and emotional interests, and he may wonder why he was ever intemperate. The Fourth of July, as we celebrate it now, is a bad habit, a bad na-

tional habit, bad in its destruction of life, of health, bad for the nerves and character of the young, as all extreme things are, and harmful to the taste of the entire nation.

Yet, bad as the habit is, we probably cannot get rid of it without the substitution of something else which is good and equally satisfactory to the temperament of the nation. It has been suggested in many places that a wise substitute would be a pageant, representing the trappings and the romantic backgrounds of history. Everybody loves a show, from a circus to a painting by a sixteenth-century Venetian, where a crowd of gayly dressed courtiers and fine ladies march across the piazza, their hearts filled with the excitement of love and with the romance of the national victory they are celebrating. But in our country, it may justly be objected that there have been no kings and queens blazing in ermine and wrought gold, no mediæval church or haughty conquerors; there can be no millennium of history, "no pell-mell of the men and women of Shakespeare's plays," no solemn cathedrals to enter, no "Cistercian abbesses, in garments whiter than the driven snow."

Nevertheless, if we have perhaps a sober-garbed history, it is not entirely devoid of the picturesque. Our white-wigged and short-trousered Revolutionary heroes strike tenderly to every American heart, as the decorative costuming of our romantic plays indicates —and what girl novelist of the States has ever failed to find material in our history for a romantic and appealing background? Our wars give opportunity for military scenes in which the trumpet and the brass band may supplant the isolated, impertinent, and destructive firecracker. A hero riding up San Juan Hill is a suggestion that may be made parenthetically.

There are, perhaps, other difficulties in the way of a great American historical pageant. We should need to learn more public honesty, for pageantry would require great coöperation and large appropriations of money. Imagine Tammany Hall organizing a consistent New York pageant for the occasion; imagine the appropriations that would be made!

One of the most important benefits to accrue from a national pageant would be the æsthetic education involved. It would give an opportunity for our municipal artists to exploit their decorative talents. Modern Paris shows how a great spectacle can be organized on a holiday without an impossibly rich reference to history, and with a moderate expenditure of money. Sensibility to form and color and musical harmony would grow, and with it a true patriotism, for we could justly be more patriotic if we had more to be proud of. If the romantic elements in our history could be shown strikingly, who can doubt that our æsthetic taste and our love of country would be heightened? There is no more patriotic people than the French and none that loves more a beautiful, orderly spectacle.

The adoption of the pageant might even create better harmony between parent and child. Children love a loud crackling noise, and their parents hate it. By means of the pageant we might be able to do away with this annoyance, for the pageant would please and refine both parents and children. The trumpet and the band would tickle the ears of the eager child, while his eyes and imagination would be ravished by the glittering pictures of the past. And if he saw at his side his father and his mother as pleased as himself, he might understand the strange fact that grown-up people are human and a pretty good sort, after all.

ELIMINATING THE CHILD.

How is it with the birth-rate in books and on the stage? People who take their æsthetic pleasures seriously, and like to speak of literature as the mirror of life, may find striking confirmation of their view in the simultaneous disappearance of the child from real life and from books. The task of statesmen is being made harder every year by a slackening increase of population. But the novelist and the playwright are not at all in the same boat with the statesman. Small families lighten the writer's problem. His interest being chiefly with the passions and behavior of men and women, he prefers to remove so complicating a factor as children very often constitute in the lives of their fathers and mothers. Thus it has been to the author's purpose even grossly to exaggerate the world's growing reluctance to reproduce. The family, as he usually sees it, is the family of two. We have travelled far from Victorian fiction, with its hordes of angel-infants dying amidst a welter of pathos; but children who die nowadays in literature are so much fewer because so many less of them are born. The dramatist, in this respect, is far more ruthless than the writer of novels. Take the particularly strong plays of the last few seasons, and in those that deal with the triangle or with any other geometrical refutation of the marriage tie, this is the common formula: five or ten years of marriage, husband busy in Colorado, wife bored in Paris, no children; or, husband well-meaning but stupid, wife intellectual and high-strung, either gnawing away at the other's happiness, no children; or, artist husband busy with pictures, artist wife busy with music, temperaments clash, and no children.

In the end, therefore, this kind of literature is untrue, even to conditions in our high-priced apartment houses; for even in flats and apartments children have been known to exist. They may be there in sadly diminished number, but there are enough of them at least to raise most human couples to human families. To Mr. Roosevelt the difference between one child and five children may seem enormous, but that is as nothing, of course, compared with the difference between the home with one child and the typical barren pair of the play or the novel. Why the stage in particular should be like Bethlehem after Herod's orders had been carried out, several matter-of-fact reasons occur. If a playwright puts children into his manuscript, they will have, as a rule, to be shown on the stage. Only now and then will audiences be content with mere allusion to a young family behind the scenes; we know how anxious Sir Roger de Coverley was for a peep at young Pyrrhus, who, by all that was said of him, must have been a fine child. Now, good child-actresses are rare. Plays like "Way Down East" still make their appeal with a stageful of little ones in checked aprons and bonnets, but our more sophisticated audiences will not tolerate the checked apron, and will howl with laughter at the stage-mother who dares to fondle the traditional rag-baby. Yet no such reasons exist for the novelist. If he leaves Rachel disconsolate because her children are not, it is because he chooses to do so.

Not that the modern child is banished either from the theatre or the story.

Peter Pan, and the unnumbered successors of Alice and of Fauntleroy, show quite enough to the contrary. Our magazines give up an utterly disproportionate amount of space to the humors and tragedies of child-life. There are Josephine Dodge Daskam's children, Myra Kelley's children, Miriam Michelson's children, Ellis Parker Butler's. But here again we have a peculiar type of artificial isolation. It is the children that fill up the book, with parents and other adults as mere foils and background. In other words, the child is the protagonist, and not what he is by nature, the child. He lives in a world of his own into which he has seemingly been projected by a special creative power; he is not a part of the world of grown-up men and women. Corresponding to our realistic form, the type of the father and mother without children, we have here almost a type of children without parents. Perhaps the only branch of art which shows the child in his natural environment is the illustrated joke. When Tommy at the dinner-table asks the minister why his wife is so homely, the artist distinctly shows a horrified father of Tommy at one end of the table and a horrified mother at the other end.

The futility of our childless literature is all the more striking, because so much of this literature attempts to deal with the phenomena of marriage. It is amusing to turn to book after book in which wedlock is depicted either as a trial, or a disillusion, or a burden, or a curse, or at best a very difficult problem, and find the vital factor of the question absent. We imagine Mr. Harriman looking into the affairs of a bankrupt railway. If he discovered that, in spite of economical road-bed construction, excellent equipment, and an admirable personnel, bankruptcy came because the managers objected to hauling freight and hated to bother with passengers, we wonder what Mr. Harriman would say.

NOTES ON FRENCH BOOKS.

PARIS, July 1.

"Le Pluralisme" (Alcan) has an added interest from its author, J.-H. Boex-Borel, the elder of the two brothers that, under the joint name of J.-H. Rosny have won renown in the writing of very distinctive novels. His book is an essay on the discontinuity and heterogeneity of phenomena, from which he argues against all Monism. "L'Être et le connaître" (Leroux), by H. Espinasset. leaves questions of existences to deal with Being, which is the heart of metaphysics, and its relations with Knowing, which is the underpinning of all philosophy and of scientific certainty as well. "Les Systèmes de philosophie" (Alcan), by the late Ernest Naville, treats of "affirmative philosophies," and is, as it were, the last testament of one, who, for the greater part of a century, had taken an active place in philosophic thought. "Essai historique sur les rapports entre la philosophie et la foi, de Bérenger de Tours à Saint Thomas d'Aquin" (Lecoffre), by Th. Heitz, is a study by a Catholic doctor of letters in a question which is still burning, but which was philosophy itself in the mediæval centuries chosen by the author for his theme, when the Scholastic philosophy was in its period of growth. Paul Fournier, dean of the university law faculty at Grenoble, in his "Études sur Joachim de Flore et ses doctrines" (A. Picard et fils), writes learnedly of the mystic doctrines of one who is little known, and that only as an apocalyptic seer. For Dante, who came just a century later, he was "with the spirit of prophecy endowed"; the Scholastics variously noted him; and his Eternal Gospel has been claimed alike by orthodox and heretical religious revivals down to our own day. René Waltz, in his "Vie de Senèque" (Perrin), presents an earnest study of the philosopher who strayed into Roman imperial politics with harm to himself and no apparent good to Nero, but with good intent as the book explains.

Professors Charles Gide and Ch. Rist publish a considerable work, "Histoire des doctrines économiques depuis les Physiocrates jusqu'à nos jours" (Larose). "Le Contrat social et les idées politiques de J.-J. Rousseau" (A. Rousseau), by Henri Rodet, a doctor of laws, analyzes the history of ideas which had to do with North and South America as well as French Revolutions. Eugène d'Eichthal, son of John Stuart Mills's correspondent and himself of the Tocqueville Liberal Democratic school, in 'Pages sociales" (Alcan) comes back again, briefly and clearly, on the social revolution, State and Democracy, and moral and religious France. J. Maxwell, a French judge of experience, treats of the duty of the community to the underworld, in "Le Crime et la société" (Flammarion); the book forms a volume of the popular Bibliothèque de Philosophie scientifique.

The Vicomte G. d'Avenel continues the long series of his studies in the economic life and mechanism of France from the middle ages to our own day, in "Les Riches depuis sept cents ans" (Armand Colin). It completes the book already published by him on peasants and workmen during the same period of time. The rich are all those who have a yearly income exceeding $500, whether from capital or labor. State functionaries, soldiers, judges, priests, diplomats, professors, and professional men, like doctors and lawyers, artists and actors, and men of letters—all pass in review from the standpoint of their annual money receipts or the payment of their work. Even the exceptions are interesting, like the million and a half of francs paid for an operation on Louis the Fourteenth, and Voltaire's riches, which were earned by other than literary industry. The final chapter comes to striking, and, at first sight, confusing conclusions. Capital in France within a hundred years has increased sixfold and wages only fourfold; and the distance between rich and poor has been increased. And yet the cost of living has scarcely doubled. Here are pretty problems of human equality. The total annual money income of France is estimated at 27,000,000,000 francs; and there are 11,000,000 separate households. Divided equally, this would give 2,500 francs for each home—the $500 per year which the book counts as riches. Country laborers earn not one half as much; many Paris workmen earn much more. Our author goes on to show that, meanwhile, the employer's share in industry and trade has also diminished. The increase of capital has, therefore, not been made at the workman's expense. That is, capital grows for other reasons than labor—by unearned increment in cities and elsewhere with ease of communications; by interest on public funds and bonds, in which capital has been invested—for labor has a yearly receipt, but capital is the accumulated receipt of fifty years. And, most of all, in France, capital increases from foreign sources where money is invested. In France, there are consequently more revenues than wages in the annual receipts; in America more wages and salaries than revenues. Hence the vanity of hard and fast deductions to prove an opposition in the development of capital and wages, or against the production of "economic highnesses" by democracies, since inevitable evolution may equalize enjoyments of well-being, but never of fortunes.

The third volume of "L'Internationale —documents et souvenirs (1864-1878)," by James Guillaume, deals with a period (1872-1876) in which the organized movement to equalize social conditions by the suppression of individual distinctions due to the possession of capital reached its natural end in the Anarchy of Bakunin. As in the former volumes, the very personal rôle played by the author colors and heightens the interest of his narration, the more so as the spirit of the Internationale has not lapsed with its organization. We have the long-announced posthumous volume

of Sully-Prudhomme, "Le Lien social" (Alcan), edited by C. Hémon, one of the poet-philosopher's disciples. It is deep dreaming of a subject by one whose mind's eye was essentially philosophic; but it is to be feared that our general confederations of labor will look rather to realities in countable wages than to moralities like solidarity and social union.

Henri Hauser of the University of Dijon continues his great work for students of history in the second volume (A. Picard et fils) of "Les Sources de l'histoire de France, XVIe siècle (1494-1610." It covers the reigns of Francis I and Henry II (1515-1559), with a first section on general and French sources, and a second on foreign sources for Francis; a third section for Henry; and a fourth devoted to details of Henry's reign. The third volume will do the same work for Francis II, Charles VIII, and Henry III, leaving a fourth for Henry IV. The entire work will thus comprise the Renaissance in France from its beginning in the Italian wars of Charles VIII and Louis XII, which was the matter of the first volume. It is rare that so complete a period of national life coincides so nearly with an artificial division of centuries. M. Pellechet publishes the third volume of his general catalogue of the Incunabula of the public libraries of France, reaching from "compagnies" to "Gregorius Magnus." It forms a volume of 660 pages. Georges Doutrepont of the University of Louvain gives us a volume of 550 pages on "La Littérature Française à la cour des Ducs de Bourgogne" (H. Champion) —Philippe le Hardi, Jean sans Peur, Philippe le Bon, and Charles le Téméraire.

S. D.

NEWS FOR BIBLIOPHILES.

A copy of the exceedingly rare account in Italian of Frobisher's voyages has recently turned up. This little book, of which no other copy is traceable, has been barely mentioned by bibliographers, who have only quoted Ternaux's meagre transcript. The title, condensed, reads: "Lo Scoprimento dello Stretto Artico et di Meta Incognita Ritrovato hel' Anno MDLXXVII & 1578 dal Capitano Martino Frobishero Inglese. Posto Novovamente in luce nel nostro idioma Italiano dal Sig. Gio. Lorenzo Anania. . . . In Napoli Appresso Gio. Battista Cappelli, 1582." The copy of the book which sold in Bright's sale (No. 2304 of the Catalogue), in March, 1845, bringing £2 10s., cannot now be located, unless it be, indeed, the present copy, which is in similar binding, "vellum, gilt leaves."

The authorized contemporary account of Frobisher's three voyages of 1576, 1577, and 1578 was prepared by George Beste, and printed by Henry Bynnemann in 1578 (the colophon is dated December 10) with the title, "A True Discourse of the late Voyages of discoverie, for the finding of a passage to Cathaya, by the Northweast." Of this book there are copies in the British Museum, John Carter Brown, and Lenox Libraries, and in the private collections of Robert Hoe, E. D. Church, A. T. White, and E. E. Ayer.

In his Dedication Beste says that "hy sundrie men's fantasies, sundry untruths are spread abroad, to the gret slaunder of this so honest and honorable an action." The printer, Bynnemann, in his address to the reader, refers to the same unauthorized publications as follows:

> And for that (as I understand) many trifling pamphlets have bin secretly thrust out, not only without the consent of the captaynes and executioners of the same, but also rather to the great disgrace of the worthy voyage, than otherwise.

The "trifling pamphlets" referred to must be those little books by Settle, Ellis, and Churchyard. Dionysius Settle's account of the second voyage (of 1577) was published as "A True Report of the Laste Voyage into the West and Northwest regions" by Henrie Middleton in 1577. Three copies are known, in the British Museum, John Carter Brown, and E. D. Church libraries. The latter copy brought £760 at Sotheby's in March, 1907. The British Museum copy contains a manuscript note to the effect that the writer had "seen a second edition of Settle's True reporte of the same year, with some slight alterations" but no copy of this second edition, as described, can now be traced.

Thomas Ellis, "sailor and one of the companie," wrote "A True Reporte of the Third and Last Voyage into Meta Incognita," which was printed in 1578 by Thomas Dawson as a small octavo of twenty leaves. Though this book (wrongly called a quarto) is described by Lowndes and copied from him by Sabin, the only copy now known is the one in the Church collection. It was purchased at Sotheby's in March, 1907, for £920.

Thomas Churchyard, a literary hack of the end of the sixteenth century, was a friend of Frobisher's apparently. He published in May, 1578, just before Frobisher set out on his third voyage, "A Prayse and Reporte of Maister Martin Forboishers Voyage to Meta Incognita," and at the end of the year he added to some copies of his "Discourse of the Queenes Maiesties Entertainement in Suffolk and Norffolk" four leaves containing "A welcome home to Master Martin Frobusher." This latter is in verse, and in it he refers to the preceding book:

> A Boke I made, at thy Farewell,
> In prose (where ere it is)
> Another for thy Welcome home,
> thou shalt have after this,
> If this mislike thee any whitte.

Of the prose tract only three copies seem to be known, two in the British Museum, and a third in the Church collection. The latter brought £1,000 in March, 1907.

Settle's book seems first to have been translated into French and printed (probably at Geneva) by Anthoine Chuppin as "La Navigation du Capitaine Martin Forbisher." Of this there are copies in the British Museum, John Carter Brown, and Lenox libraries, and in the Church collection.

From the French version translations were made into Latin and German, both published in 1580 at Nuremberg by Catharine Gerlachin. These had included an account of the second voyage only. Then in 1582 at Naples there appeared the Italian translation noted above. This contains an account of both the second and third voyages, the latter probably adapted from Ellis's book.

Correspondence.

"BOOSTING."

To the Editor of The Nation:

Sir: Not long ago, Edward S. Martin wrote for the *Atlantic* an interesting little essay on advertisement. In its cheerful homage to the God of Things As They Are, the essay was characteristic both of the author and of the times. If I understood Mr. Martin correctly, his drift was that the prejudice against the advertisement of personal or professional qualities is old-fashioned and rather foolish; that advertisement of everything is a natural development of democracy and the spread of education; and that it must be a good thing, since "it is a form of publicity," and publicity is "cousin to Truth, and Truth shall prevail." The cousinship sometimes appears to be rather distant; but, even if we let that pass, is it not rather a strange kind of argument by which the excellence of a person may be inferred from the belief that his cousin shall prevail?

Whether the inference is sound or not, I presume the conclusion would be accepted without much question by most Americans. As a nation, we believe in advertising everything, from sermons to shoelaces, from colleges to cathartics. There is a form of advertisement very popular in this part of the country and I think growing in popularity elsewhere, commonly known as "boosting." No doubt it is a distant cousin of Truth. At all events, I should like to examine both the cousin and the cousinship a little.

The term is, of course, a metaphorical application of a word that we all used as boys. The metaphorical usage, I think, originated in the West; it is widely employed here, and seems to be coming into use all over the country. Not long ago I came across it in the comparatively classic pages of the Springfield *Republican*. The dictionary says that the word is etymologically connected with "to boast," and with words in other languages meaning "to blow" or "to swell." It is a hard word to define accurately, but it means approximately this: to praise constantly and liberally anything or everything relating to one's self—for instance, one's town or State or college or country; and never to admit any defect in these things. The direct opposite of "to boost" is "to knock," that is, to blame, recognize, or admit some faults or differences from the ideal in anything relating to one's self. Boosting is coming to be recognized as one of the cardinal virtues. A newspaper recently concluded an enthusiastic eulogy of a prominent citizen with these solemn words: "He was a booster." Knocking, on the other hand, is regarded as one of the Seven Deadly Sins, having, perhaps, displaced pride in that illustrious company.

The conscientious cultivation of this virtue and avoidance of this vice have already led to some interesting results in the rising generation. The avowed aim of boosting is progress, and progress of a material kind may have been aided by the first generation of boosters, who never more than half believed what they said. They were whistling to keep their courage up. But the second generation takes boosting literally. Through a natural and par-

donable confusion of boosting with its distant cousin, Truth, they have reached a state of mind similar to that of those who, in other days, believed that they were the elect—with this important difference, that, while the elect believed that they alone had attained perfection, the young Americans I have in mind believe that everything even remotely pertaining to themselves has attained it. You cannot convince them, for instance, that English railways have fewer accidents than ours, or that German cities are better governed. The thing is inconceivable: are not we the greatest and best people in the world?

The ideal goal toward which the boosters are tending and which, as I have suggested, some of them have already reached, is a state of mind similar to that of China before China began to wake up. Could anything be more Chinese than the following paragraph, from a high school oration which was approved by the principal of the school and entered in an interscholastic contest:

Conceit reigns unmolested in the hearts of men. Foreigners have been so careless in their expressions and so conceited in their hearts as to pick flaws in American character and custom.

Taken by itself, this is amusing enough, but when we consider that it represents the honest opinion of a considerable part of young America, it is enough to make the judicious grieve, if not to make the angels weep. The lack of opportunities for comparison resulting from our geographical isolation makes us peculiarly liable to this sort of infatuation. It may become a serious menace to the national welfare. A keen observer, Mrs. Anna M. Rogers, who recognizes and deplores this tendency, has suggested that it might be partly counteracted by introducing into our public schools the reading of such intelligent foreign criticism of America as Arnold's and Münsterberg's. The suggestion seems worth careful consideration. A bit of reading which might be quite as valuable for this purpose, and which ought to be printed in every reading book in America, is Cardinal Newman's definition of a gentleman. The ideal there beautifully set forth is one that we cannot afford to forget.

HOMER E. WOODBRIDGE.

Colorado Springs, June 24.

THE DUTY ON PICTURE POST-CARDS.

TO THE EDITOR OF THE NATION:

SIR: Your arraignment of the action of the Finance Committee of the Senate in increasing the duty on picture post-cards by over 300 per cent. (contained in your issue of July 1) has had rather an exhilarating effect on me, although I am myself engaged in the lithographing and printing business, and am a member of the National Association of Employing Lithographers, through whose efforts, I believe, the Finance Committee of the Senate was persuaded to raise the import duties in question.

I feel that in principle your position is absolutely correct. I believe in the blessings that come with the fight for existence, and I personally delight to meet and to grapple with competition. In fact, as for myself and my company, I do not much care what the tariff is. But I feel it would be as unfair to press my convictions on my colleagues, as it seems unjust on your part to pass judgment on the apparently ludicrous proposition of raising the duties on picture post-cards over 300 per cent., without carefully weighing what may be said on the other side of the question.

The facts are that without some such equalizing duty post-cards, of the kind in view, cannot be produced in America. Whether or not, under these conditions, they should be attempted at all is another question. My own company, on several occasions, has considered the advisability of entering this large and seductive field, but was obliged each time to pass the proposition by.

The reasons why, without heavy tariff protection, picture post-cards cannot be made in America are:

(1.) Because the wages for work of this class are in Germany from one-half down to one-fourth of our own standards and scales as established by the unions.

(2.) Because we are debarred by Federal laws from importing from European countries artisans expert at this class of work—or any other, for that matter.

Now, in commodities of this kind, the labor item alone is between 35 per cent. and 50 per cent. of the output value. Against this initial cost the fact that the German must buy photographs here, reproduce them at home, transport them back again, is of very small significance. All our ingenuity and efforts at economy in production go for little when the item of skilled human labor forms so large a part of the selling price of a given article.

But the greatest handicap that commercial art work in our country has to contend with is contained in that disgraceful and insidious law which prevents the engagement freely of new talent wherever it may be found: the so-called alien contract law. Organized labor, the father of this law, secure in its hold upon American industry, has contrived to deaden individual effort and to restrain technical advancement among its members, while at the same time, with the aid of this law, it prevents the employer from infusing, by importations from technically more alert and advanced countries, new blood with which to take up competition with the rest of the world on something like equal terms.

JULIUS GUGLER.

Milwaukee, Wis., July 4.

TAXING CORPORATION BONDS.

TO THE EDITOR OF THE NATION:

SIR: In "The Week" of your issue of July 1, you refer to the proposal, in the tariff bill now before the Senate, for a tax on corporations and strongly object to exempting them from paying a tax on their bonds. I cannot conceive how you or any other sensible man can see any right, equity, or justice in an attempt to make a corporation, or a man, pay a tax on the debts he owes. Corporate bonds are merely evidences of a debt owing by the corporation. Why should a corporation pay taxes on its debts any more than you should pay a tax on your note of hand or on a debt you may owe to your grocer or butcher? I have never heard of a more monstrous proposition. If you would have the owner of the bond pay a tax on it, you would then have an income tax and not a corporation tax at all.

Congress, and, I believe, every property owner in the country, are opposed, and rightly, I think, to an income tax, and I believe Congress would do a great wrong if it tried to accomplish by indirection what it dare not do directly.

Of course all socialists, and populists, and non-tax-payers are in favor of an income tax, for the reason that it will rob the property owner, but I cannot conceive that you belong to either of these classes, and hence cannot conceive how you can think that a corporation should pay a tax on its debts.

JOSEPH ADDISON.

Chicago, July 5.

[There was no proposal to tax bonds. It was only a question whether the interest on bonds should be deducted from the net income of the corporation on which the tax was to be levied.—ED. NATION.]

THE TARIFF ON ART.

TO THE EDITOR OF THE NATION:

SIR: The tariff bill, now in process of preparation, having passed the Senate, will soon be in the hands of a committee of conference of the two Houses.

I believe that there is a difference between the Senate and the House on the subject of the admission to this country of works of art, the provision of the Payne bill relating to that matter being more liberal, according to my present understanding, than that of the proposed Aldrich or Senate bill.

In the issue of the London *Athenæum* for June 12, 1909 (p. 708), there is a paper on the "Chauchard Legacy to the Louvre." In this case a collector of works of art had accumulated a most valuable gallery of modern paintings, numbering nearly 200 pictures of a high grade; and he has now left it to the nation. Among these masterpieces are no less than twenty-five examples of Corot, seventeen of Diaz, eight of Daubigny, seven of Th. Rousseau, eighteen of Troyon, and twenty-six of Meissonier. After thus enumerating them, the writer of the article in the *Athenæum* proceeds as follows:

The most famous, although perhaps not the finest, of the seven by J. F. Millet is L'Angelus, which, originally sold for about £60, was knocked down in the Sécretan sale in 1889 for 553 000 francs. It was then obtained by M. Antonin Proust, who was acting on behalf of those who desired that it should remain in France; but the French government decided not to purchase the picture at this high price, and M. Proust handed it over to an American syndicate, who had been the underbidders. But the American customs authorities claimed a duty of something like £7,000, which they consented to waive on condition that the picture did not remain more than six months in America, and was not resold there. So the picture found its way back to Paris, and was purchased by M. Chauchard.

At just this juncture, and with a new proposed tariff under consideration, the above extract from a foreign journal calls for no comment. It speaks for itself.

CHARLES FRANCIS ADAMS.

Boston, July 7.

THE TRIAL OF ANIMALS.

TO THE EDITOR OF THE NATION:

SIR: The recent notes in your columns on the trial and punishment of animals in

mediæval times seem to have come exclusively from antiquarians, philologists, and literators. It is a little odd that the lawyers' share in elucidating the meaning of those practices has apparently not come to the notice of your learned correspondents; though the subject is essentially one of legal history. A careful study of it was printed in 1892, by Prof. Karl von Amira (then of Innsbruck, now of Munich), one of Germany's greatest legal historians, "Thierstrafen und Thierprocesse." A long list of other references (in part by legal historians) will be found in Dr. E. P. Evans's "Criminal Prosecution and Capital Punishment of Animals" (New York, 1907). The first part of this volume treats the matter historically; Dr. Evans, not being, I believe, a lawyer, has not fully traced out the latent legal ideas.

A chief explanatory fact, for all these practices, is the primitive and mediæval attitude towards what we should now call the theory of criminal responsibility; the treatment of animals is merely one side of a larger subject. Citations to the works dealing with it, not only in Europe but in other systems of law, will be found in essay No. 66 of "Select Essays in Anglo-American Legal History" (Boston; vol. III, now in press). W.

Chicago, July 1.

Notes.

Ernest H. Shackleton's book, giving a full account of his antarctic expeditions, 1907-1909, will be published in November by the J. B. Lippincott Company. It will be issued in two substantial volumes with color plates and more than 300 illustrations from photographs.

The Oxford University Press announces for early publication "A Short History of English Agriculture," by W. H. R. Curtler.

Late this summer Duffield & Co. will bring out Albert Sonnichsen's "Confessions of a Macedonian Bandit," giving his adventures in Macedonia as a member of the Committee of Revolution. The same house promises for the early autumn a new issue of the Shakespeare Library, to be called "The Shakespeare Allusion Book." It will be in two octavo volumes, and will contain the allusions originally collected by Dr. Ingleby, Miss L. Toulmin Smith, and Dr. Furnivall, now for the first time arranged in chronological order and supplemented with explanatory notes.

A ninth edition of "Norway, Sweden, and Denmark, with Excursions to Iceland and Spitsbergen" has come to us from the incomparable Baedeker (imported by Charles Scribner's Sons). In its present form this work is revised and somewhat augmented, and with its abundance of maps and plots offers a strong lure to travel in these Northern lands.

The first of the series of Noble Thoughts, edited by the late Dana Estes, and published by Dana Estes & Co., contains the "Meditations of Marcus Aurelius." It is regrettable that no indication is given of the translator whose version is here followed, or of the fact that the text is not reproduced in its complete form. A second volume contains "The Thoughts of John Ruskin," a series of short paragraphs grouped under such headings as Beauty, Painting, and Nature Studies. Each volume has a suitable introduction, and is printed in heavy faced type and bound in limp green leather.

Mr. (or, as we must now say, Sir) Henry W. Lucy's "Sixty Years in the Wilderness: Some Passages by the Way" (E. P. Dutton) is a pleasant but slight narrative of his journalistic experiences and his friendships. Most of the volume had previous publication in various periodicals, and the collection of the articles here does not rob them of their fugitive look. Good nature, a gentle humor, absence of bitterness or of style that bites—these are the qualities which the writer has long identified with his name, and they mark this latest book of his.

The Rev. P. H. Ditchfield has evidently taken upon himself to gather into a succession of volumes the romance and humors of old English life. Some time ago (November 7, 1907) we had occasion to speak of his book on "The Parish Clerk." Again, the next year (September 10, 1908) he brought out a pleasant work on "The Charm of the English Village." Now E. P. Dutton & Co. are publishing in this country the second edition of "The Old-Time Parson," which, as the title implies, is a companion volume to "The Parish Clerk." It seems to us a pity that Mr. Ditchfield in this book should have given so much space to controversial matters of the Reformation, and especially to a rather bitter account of the sufferings of the clergy under the Commonwealth. That he should write from the high Anglican point of view is natural, and indeed only a man of such persuasion would be likely to devote his time to gathering up these annals of clerical life. But we enjoy his work much more when he forgets the battles of intolerance and gives us stories of the eccentricities and beautiful charities of old-time country parsons. There is abundance of material of this sort in his chapters, but there is still room for a fuller story of the life represented by such men as George Herbert on the one hand, and R. S. Hawker on the other.

"The Struggle for Imperial Unity," by Col. George T. Denison (The Macmillan Co.), recounts the experiences and recollections of a Canadian imbued with a dominating passion for a Pan-Anglican *Kriegs- und Zoll-Verein*. The question of the desirability of an eventual economic and political alignment of Canada with the United States is simply not arguable with Col. Denison. For a Canadian to entertain such a hope he says flatly is treason. The book narrates the author's exertions in awakening the imperial spirit in Canada and in England. Some passages offend the American reader. There is a superfluous strain of rather contemptuous reflection upon our "national spirit," the "Yankee militia," and our mercenary motives (pp. 66, 162, 193). One must concede, however, that the design which Col. Denison has at heart has been very sensibly promoted by his tireless efforts in its behalf. His accounts of interviews with Lord Salisbury, Joseph Chamberlain, and others, are illuminating, and the American statesman may profit by the author's account of how the national spirit in Canada has been fostered by our own stupid policy toward them. Since the expiry of our reciprocity treaty with Canada, the Dominion has been created, and manifold ties have bound it more closely to Great Britain. We have contributed our share to this alienation of Canada by the McKinley tariff and the virulence of the Venezuelan message.

The publishing house of A. Pierson, in Dresden, has brought out "Perlen Englischer Dichtung" (Pearls of English Poetry), by Herman Behr. Mr. Behr is not a German author, but a New York business man, who devotes his leisure to literary pursuits. "Perlen Englischer Dichtung" is the result of several years' labor of love, inspired in turn by the translator's enthusiasm for the fifty poems which he has rendered into German. Nor has he made his problem easy by selecting poems that, as it were, translate themselves. Certainly, "The Bridge of Sighs" is one of the most difficult English poems to reproduce in a foreign language, yet Mr. Behr has preserved not only the dirgelike rhythmical cadence, but also the pathos of the original. "Locksley Hall," in certain stanzas, actually seems more sonorous in German, and several of Keats's odes are most happily transferred. Indeed, Mr. Behr's translations hold to the poems, from which they are made, the same relation as do fine mezzotint engravings to the original paintings. They are interpretations in another medium, not copies.

President Henry Churchill King's "The Laws of Friendship" (Macmillan) is a good book for an age little given to seeing visions or indulging in dreams. It treats its great theme, human and divine, *con amore*, yet without rapture. President King does not value very highly those rare moments of ecstasy which come to the introspective saint. Into the genuine and mysterious joys of life we pass, he holds, by no mysterious means, but by common and open ways. The man who has learned obedience to the laws of disinterested love in the human relationship has already learned the laws which govern right relationship with God. This implies that friendship with God must be sustained by a broad, many-sided culture. "How can our love increase," was the deep question of Thoreau, "unless our loveliness increases also?" Particularly suggestive is the chapter on the "Self-Forgetful Mood," which is an exposition of the inalterable truth that the strongest friendships are formed between those who forget themselves and each other in their devotion to some heart-uplifting cause—the cause, for example, of God. Though we miss in this work the golden vistas of illumination opened to us by the old English divines, we find in it something of their eagerness to know the highest friendship, and something of their wisdom in the pursuit of it.

The two volumes on Edward Randolph, now issued by the Prince Society (Boston), add not a little to our knowledge of that interesting and somewhat erratic royal commissioner, sent from England to control customs duties in the colonies in the last quarter of the seventeenth century. A number of documents have been found since Mr. Toppan's volumes on Randolph were printed, and of especial value is a series of letters from Randolph to Blathwayt intended for the personal use of the latter. In such a form the agent

could be more free in his expressions, and full use was made of this freedom. This he found to his cost, for an intercepted letter led to his imprisonment, the Governor of Bermuda not liking some of the criticisms of his conduct. Nor was this the only instance of persecution directed against Randolph. It was but natural for him to arouse the dislike and opposition of the colonists, for he was possessed by the idea that a good part of the colonial trade was illegal, and attempted to prove it so by enforcing the laws. It was one thing to pass the laws in London, and quite another to enforce them in America. Many in high office were concerned in the forbidden practices, and they resented his interference. The Governors would tell him that they were there to carry out the laws, and their instructions were sufficient to control the administration of the customs. Wherever he went, and he was in every colony from Piscataqua to Bermuda, he saw the same conditions: neglect of the law, dishonest officials, and combinations among the great to share in the illegal profits. He warned his superiors against the "leprosye of Rebellion" that had spread from Boston. He suffered by his connection with Andros and his eagerness to prove his worth to the King. The juries would not convict, the courts would not enforce his seizures of goods or vessels, and the merchants ignored his demand for formalities in entries. He was, as he said, an "unwelcome guest." He had a strong prejudice against the Scotch, who had been active in absorbing the rich tobacco trade of Virginia and Maryland; but his protests were ignored or met in such a fashion as to make him "quite tyred with the starched conversation and Spanish Gravity of ye Genl. Assembly." He appears to have been an intelligent but over-zealous and untactful officer, recognizing what was wrong, and intent upon correcting through law. His reports are good reading as well as good history, and he was as honest in pocket as in opinion, which is high praise for that day. The documents are admirably edited by the Rev. Mr. A. T. S. Goodrick.

"The Russian Conquest of the Caucasus," by John F. Baddeley, with maps, plans, and illustrations (Longmans, Green, & Co.), gives a history of the campaigns against the Caucasus as a whole up to 1829, including an account of the Turkish and Persian wars in the regions south of the mountains; and of the conquest of the tribes in the eastern Caucasus, ending with the capture of their leader Shamil in 1859. The desultory fighting against the western tribes, as intrinsically less interesting, is not recounted. Mr. Baddeley is personally familiar with the regions of which he writes, and draws his historical materials largely from Russian official sources. His main subject, the wars of the Russians with the tribesmen, has never before been presented to English readers. Of them he gives a clear and impartial, but not a particularly animated, narrative. Though his point of view is that of a military historian, he is not blind to the human and romantic interests involved. Of each commander's work he forms an independent judgment, casting grave doubts, for example, on the wisdom of Yermóloff's policy of ruthless repression, which he regards as responsible in large measure for the growth of Muridism and so for the nearly thirty years of warfare, with its legacies of hatred, required to repress it. His general sympathies for the Russians do not prevent him from heartily admiring the heroic struggle of Shamil and his few thousands of followers against the forces of an empire that encircled him on all sides. The volume is handsomely and accurately printed. A full index, and, above all, a number of excellent maps, make it possible for even an untrained reader to follow the complicated operations described in the text.

"Brittany: the Land of the Sardine," by Hugh M. Smith, in the *National Geographic Magazine* for June, is an unusually interesting and suggestive account of a people remarkable in many respects, but especially for the preservation of their ancient racial characteristics. Their aloofness from their neighbors is shown by the fact that one in every five Bretons cannot speak French, while "many features of Breton religious practice to-day are relics of prehistoric paganism." As the author's visit was in the interest of the Bureau of Fisheries, of which he is deputy commissioner, the most attention is paid to the sardine industry, which is the principal dependence of the people, some of the more than 100 canneries having an output in ordinary years of 5,000,000 boxes each, the number of employees being 30,000 fishermen and 20,000 canners, mostly women and girls. The article is fully illustrated. Attention should also be directed to the remarkable series of pictures of the world's highest mountains with accompanying text by Charles E. Fay, first president of the American Alpine Club. The announcement is made that the National Geographic Society has sent an expedition, under the leadership of Prof. R. S. Tarr of Cornell and Prof. L. Martin of the University of Wisconsin, to spend July, August, and September in studying the glaciers of southeastern Alaska, in many respects the most important, geographically, in the world.

The Pope has recently established in Rome a new Papal Bible Institute, and the Catholic papers reproduce the official Apostolic Declaration that is to control its work. The rules are the following: (1.) The Papal Biblical Institute is directly dependent on the Apostolic chair and is to be controlled by the directions and orders of the latter; (2) the management of the Institute is to be in the hands of a chairman to be appointed by the Pope, and this chairman is to represent the Institute externally and report all important matter pertaining to the Institute at least once a year to the Papal chair; (3) the full or ordinary professors of the Institute are to constitute its council, which, in conjunction with the chairman, is to oversee its work; (4) the highest norm for the studies and the control of the Institute will be determined by the Apostolic chair and be issued by the Papal Biblical Commission in the form of decrees and orders. These decrees and orders are to be rigidly observed, and all members of the Institute are to coöperate in this work, be they teachers or students. By way of comment on this new arrangement the *Kirchenzeitung* of Leipzig, a leading Protestant organ, declares that the whole project is to control Bible studies within the Catholic church, crush out independent scholarship, and make learning subservient to the interests of the Papal chair.

As a further instalment of the Religionsgeschichtliche Volksbücher (Tübingen: Mohr), we have now "Christus, Die Anfänge des Dogmas," by Prof. Johannes Weiss of Heidelberg. The popularity of this remarkable series appears from the fact that this brochure is at once published in an edition of ten thousand.

The Insel-Verlag of Leipzig has issued the seventh volume of its new and complete edition of the works of Wilhelm Heinse. It is a book of 316 pages, containing the diaries from 1780 to 1800. The editor is Carl Schüddekopf, assistant professor of the Goethe und Schiller Archiv in Weimar. The work gives intimate glimpses of the personality of the author, whose "Ardinghello" and "Hildegard von Hohenthal" have delighted artists and musicians no less than readers of philosophical fiction.

No writer among the German romanticists has been more frequently edited and more widely discussed than E. T. A. Hoffmann. French critics so readily appreciated his fanciful whimsicality that he became one of the most popular German authors in their country. Interest in his versatile and erratic genius has recently experienced a strong revival in Germany. His musical compositions have been published, and the Bibliographische Institut of Leipzig has entrusted Dr. Victor Schweizer with a critical, annotated edition of his complete works, of which the fourth volume is now ready.

Volume II of the Arabic text of Jaqut's "Dictionary of Learned Men," published by the Trustees of the Gibb Memorial (Leyden: Brill; London: Luzac), is edited by Prof. D. S. Margoliouth of Oxford, who asks that persons who discover the existence of portions of this work in libraries or collections of which there are no printed catalogues will communicate their knowledge either to him or to one of the trustees. This volume, like the first, is taken from MS. Bodl. Or. 753, and brings the work down to the end of the letter *Jim.*

The Academy of Neuenburg in Switzerland, by resolution of the government authorities, has been changed into a full university. This makes the seventh university in Switzerland.

The Bavarian Academy of Sciences in Munich, with the assistance of the Academies of Berlin, Göttingen, and Leipzig, has begun the publication of a "Gesamtausgabe der Mittelalterlichen Handschriften Verzeichnisse Deutschlands." The material has been collecting since 1906, and includes all the libraries and book centres of the Middle Ages in Germany and German Switzerland. The matter will be brought down to 1500. This new venture, of equal importance for the theologian, the philologian, and the historian, is in editorial charge of Dr. Paul Lehmann of Munich.

The 30,000 francs of the Fondation Brousse has been distributed by the French Institute. Three thousand francs go to the publication of the correspondence of Bossuet, and a like amount for the reproduction of a MS. of Plato. Other awards are made, the largest of which is 7,000 francs for the rearrangement of the library and reference room of the Institute.

John F. Hume, an abolitionist editor and banker, died last Saturday in Poughkeepsie,

aged seventy-nine years. Mr. Hume was graduated from Wesleyan University in 1850. In 1855 he was a member of the Ohio State Legislature. In 1858 he moved to St. Louis, where he became editor of the *Globe-Democrat*. He was a vigorous opponent of the slave traffic. One of his books, "The Abolitionist," is considered a classic on the subject.

From Gotha comes the news of the death of Dr. August Specht, at the age of sixty-four. He was for many years editor of *Menschentum*, a liberal organ. His publications include: "Populäre Entwickelungsgeschichte der Welt," "Theologie und Wissenschaft," and "Gehirn und Seele."

RECENT VERSE.

Star-Glow and Song. By Charles Buxton Going. New York: Harper & Bros.

The House of Falling Leaves and Other Poems. By William Stanley Braithwaite. Boston: John W. Luce & Co.

Nirvana Days. By Cale Young Rice. New York: Doubleday, Page & Co.

A Wine of Wizardry and Other Poems. By George Sterling. San Francisco: A. M. Robertson.

Day Dreams of Greece. By Charles Wharton Stork. Philadelphia: J. B. Lippincott Co.

Artemision: Idylls and Songs. By Maurice Hewlett. New York: Charles Scribner's Sons.

Artemis to Actæon and Other Verse. By Edith Wharton. New York: Charles Scribner's Sons.

When Lincoln Died and Other Poems. By Edward William Thomson. Boston: Houghton Mifflin Co.

Songs from Sky Meadows. By Charles H. Crandall. New York: Outing Publishing Co.

The Irish Poems of Alfred Perceval Graves. 2 vols. New York: The Macmillan Co.

The Joy o' Life and Other Poems. By Theodosia Garrison. New York: Mitchell Kennerley.

Each in His Own Tongue and Other Poems. By William Herbert Carruth. New York: G. P. Putnam's Sons.

The Poems of Richard Watson Gilder. Boston: Houghton Mifflin Co.

The verse has been running a little thin of late. For the season there may be a dozen volumes of interest—hardly more. Curiously enough, they have few characteristics in common, as though the writers were uncertain of the right way and had agreed to scatter in search of it. And yet there are certain recurrent, if not persistent, notes which make a kind of comparison possible. Among them is distinctly audible the pulse of the sea—not the heroical Homeric beat, the oceanic heave and surge, but a dreamlike nostalgic murmur, insinuating and Circean. Like a sob it haunts the second part of Mr. Going's "Star-Glow and Song," which contains by all odds his best work, such is the natural witchery of the theme:

These are great songs that hold the heart
Wakeful among the silences.
. . . . . .
Songs of the sea
That murmur round the caverns and the crags,
Sob in the rising tide and prattle low
Ebbing among the pebbles of the beach.
They cry strange things, and call along the strand
Till men leave home and love to follow them.
And some return with vision-haunted eyes;
But some the sea drags down, and over them—
Dim, spectral, wavering—the hollow surf
Intones forever.

It is the same strain that mingles, too, with the elegiac rustle of foliage in Mr. Braithwaite's "House of Falling Leaves," and accompanies regretfully his plaint for the loss of Frederic Knowles, to whose memory the volume is dedicated. In a sonnet on Sir Walter Raleigh, in particular, he catches admirably, save for a halting line or two, the plaintive appealingness of coastwise waters, the sea of reef and shallow and falling shore:

He heard the four winds and the seven seas,
And voices inland under alien stars,
And drove ambition like auroral cars
Striking the hill-tops when the darkness flees.
Vain in his dreams but brave in his vanities;
No carpet-knight yet versed in parlor wars;
And half a rogue when honesty debars
The desire to take the prize his fancy sees.

And yet he knew the silences of speech—
The leaf-heard utterances of April rains;
The echoes in the twilight out of reach
Beyond the dim horizon where it wanes.
And like the distant sea-wash on the beach
He sang a few sad tender lyric strains.

With Mr. Rice also the sea is a favorite subject. But in his "Nirvana Days" it has begun to grow a little feline. It is not merely a presence that calls to the kindred tides of the blood and the pulses of the brain, but an *Ungeheuer*, a thing shifty, seductive, and perfidious as well:

Night is above me,
And Night is above the night.
The sea is beside me soughing, or is still.
The earth as a somnambulist moves on
In a strange sleep. . . .
A sea-bird cries,
And the cry wakes in me
Dim, dead sea-folk, my sires—
Who more than myself are me.
Who sat on their beach long nights ago and saw
The sea in its silence;
And cursed it or implored;
Or with the Cross defied;
Then on the morrow in their boats went down.

Significant or not, the little sense of uncanniness which is just perceptible in these lines, is worth noticing, for it reappears every now and then, stringing these verses like a scarlet thread. Mr. Rice himself has drawn it out and woven it into an extraordinary pattern in another poem, "more or less dramatic," purporting to be "written in Hell by Sir Giles, whom the witch of Urm leads to Judas Iscariot." A single stanza will suffice as an example of this curious experiment in unearthliness:

So I was drawn through dark cadaverous
with the sound of gabbling dead.
Where we heard them hoot palaverous
Drivel learned beneath unsavorous
Moulds, and saw a glutton's head
Grin to a hissing bat,
That scraped him as he spat.

Tour de force though this may be—for the verses have a kind of cumulative imperiousness when read consecutively—it gains a certain authority for the kind of thing it is, when it is found repeated independently by other poets. Mr. Sterling's "Wine of Wizardry" contains another example in a "Dream of Fear"—a sort of ghoulish graveyard stroll—in which the two spirits of romance and fatality, which mark his verse most prominently, seem to have met and condensed into a hopeless obsession of misery. He is at his best, however, when he keeps the two strains apart—in his "Homing of Drake" or his resonant "Romance":

Thou passest, and we know thee not, Romance!
Thy gaze is backward, and thy heart is fed
With murmurs and with music of the dead.
Alas, our battle! for the rays that glance
On thy dethroning sword and haughty lance
Are of forgotten suns and stars long fled;
Thou weavest phantom roses for thy head,
And ghostly queens in thy dominion dance.

Would we might follow thy returning wings,
And in thy farthest haven beach our prow—
Thy dragons conquered and thine oceans crossed—
And find thee standing on the dust of kings,
A lion at thy side and on thy brow
The light of sunsets wonderful and lost!

Perhaps it is the nerves, after all, which make the difference in matters of this kind. The pious Æneas's descent to the underworld is quite other than that of the wily Ulysses. And in Mr. Stork's prettily told version of Psyche's wanderings, which occupies the greater part of his "Day Dreams of Greece," the heroine, who has much the same journey to go, takes it very differently from Mr. Rice's Sir Giles or Mr. Sterling's Dreamer of Fear, thus:

Psyche stepped
From out the world of sunlight and of air
Into the land of shadow, following down
The path by which no living thing returns,
Which darkened as she went until it seemed
To lead her straight into the heart of night.
From that time forth the terrors of the way
Were as a dream that seethes with nameless shapes.
The spirits of the dead trooped by, pale blurs

That stared from out the windows of the dark;
Gigantic beasts and titans loomed above,
More awful than the blackness. By the shore
Of Styx a gibbering concourse swayed and thronged
Round Charon's boat, but Psyche, resolute,
Passed on and pushed the yielding shades aside
As one who wades in haste through waving wheat.

This is another thing, to be sure; but the contrast between the same subject treated romantically and classically is not uninstructive; and there is a touch of sobering tradition about Mr. Stork's work which most verse just now seems image:

On the contrary, Mr. Hewlett's treatment of classic themes, of which his "Artemision" is composed, has suffered to some extent from the poet's temperament. To say that Mr. Hewlett has no sense for such subjects, would be absurd. But he does appear to be without the requisite transparency for their most successful transmission. Against this severe and sober background his embroideries look a little filigree. Admirable in themselves, as applied to classic story they have something of the incongruity which we associate with the Renaissance. Even his pentameter couplets at their smoothest, as in his attractive little picture of Niobe and her children, are somewhat too teased and ruffled to yield a perfectly clear image.

But when the long day drows'd
And fell asleep, and all the men were hous'd,
And Thebæ's streets were still—only the watch
Paced slow the ways, looking at every latch
And eyeing every hurrier—she and they
Within the close-shut doors in white array,
Gather'd to rid the master of his toil.
Him and his sons, with unguent and sweet oil,
Washing of feet; all service of the house
They did, and comely serv'd the decent use
Of those old days, which saw women most fair
When most men's helpmeet, and most debonair
When meekest. After this they sat at meat
In order due, and when desire to eat
And drink was put away, one with a harp
Would draw sweet verse from children's voices sharp,
And eagerly about that rafter'd hall
The anthem soar'd; and lads and maidens all
Together made strong harmony
(Even as they lived harmonious). Only she,
Niobe, sat quite still and thrill'd apart,
Brooding upon her joy, and heard her heart
Follow the descant with its own strong rumor.

Even Miss Wharton's "Artemis to Actæon"—the most finished, the most literary volume of the collection—is by no means free of nerves. It is hardly uncanny or yet morbid—those are not the words; but it is musky. It is full of unrest and strain; it itches to allegorize in strange effective fashions. For this reason "Life," the most distinctive poem in the book, is intelligible only as a whole; but the following fragment of a sunset is not uncharacteristic in its way:

Leaguered in fire
The wild black promontories of the coast extend
Their savage silhouettes;
The sun in universal carnage sets,
And, halting higher,
The motionless storm-clouds mass their sullen threats,
Like an advancing mob in sword-points penned,
That, balked, yet stands at bay.
Mid-zenith hangs the fascinated day
In wind-lustrated hollows crystalline,
A wan Valkyrie whose wide pinions shine
Across the ensanguined ruins of the fray,
And in her hand swings high o'erhead,
Above the waste of war,
The silver torchlight of the evening star
Wherewith to search the faces of the dead.

On the other hand, Lincoln's anniversary and its associations, working in a contrary sense, seem to have provoked a perfect apotheosis of homeliness. The disposition is curious—not so much to relieve the poetic from the mask of commonplace which disguises it, as to insist upon the absolute poetic value of the rind itself. As such it involves a complete displacement of ideals. A quotation from Mr. Thomson's "When Lincoln Died" will illustrate the feeling aptly:

My private shrine. The Gettysburg Address
Framed in with all authentic photographs
Of him from whom the New Religion flows.

Homely? That's it. A perfect homeliness.
Homely as Home itself that countenance
Benign, immortal sweet, his very soul.
The steadfast, common, great American.

It is a gladness in my aging heart
These eyes three times beheld himself alive,
Ungainly, jointed loose, rail-fence-like, queer
In garb that hung with scarecrow shapelessness—
Absolute figure of The States half-made,
Turning from toil and joke to sacred war.

Nor in the revival of familiar feeling does the Rough Rider want his poet. Amid the various contents of Mr. Crandall's "Songs from Sky Meadows," he, too, is sung with some spirit, if little dignity. But then he has always been something of a fancy figure in current verse:

Unpretendingly he dropped the branding-iron upon the plain,
Threw the lariat to his partner, waved the eastward-glimmering train;
Bade adieu to dog and bronco, friends that drew a brace of tears;
Wondered if he'd round-up Spaniards handy as he coralled steers.
Then he sweated in the transport, broiled upon the torrid sand,
Fingering the Krag-Jorg lever 'til 'twas ready to his hand;
Got his clothes to setting on him, got just chummy with the sun—
Cooked immune in showers that sizzled when they pattered on his gun.
Then he took the trail, all quiet, stepping in his comrade's tracks;
Stripping slowly for the tussle, dropping extra togs and packs;
Gripping to the stock and barrel, ready for a Dago rise,
Humming softly little songs of Sunday-school and Paradise.

Racy, perhaps, rather than homely—at all events they are bound to seem so to the Yankee—are Mr. Graves's "Irish Poems." Influenced to some extent by the Gaelic revival and in some cases drawing their inspiration directly from the native literature, they have quite a different tang from ordinary Anglo-Irish poetry, while preserving all the shrewdness, naïveté, and mischievousness of their country. At the same time, traces are noticeable here and there of that odd literary sophistication which the poets of Ireland apparently find it hard to get rid of:

O, Woman, shapely as the swan,
Shall I turn wan for looks from thee?
Nay, bend those blue love-darting eyes
On men unwise, they wound not me.
Red lips and ripe and rose soft cheek,
Shall limbs turn weak and color flee,
And languorous grace and foam-white form,
Shall still blood storm because of ye?

Thy slender waist, thy *cool* of gold
In ringlets rolled around thy knee,
Thy scented sighs and looks of flame,
They shall not tame my spirit free.
For, Woman, shapely as the swan,
A wary man hath nurtured me;
White neck and arm, bright lip and eye,
I shall not die for love of ye!

Nor is Mrs. Garrison's "Joy o' Life"—for all its spontaneity and freshness, its fondness for the open air and the high road—wholly free from a slight air of research. At all events, there is about it at times a mixture of motives, an anachronism of mood which recalls with a difference Christina Rossetti:

I know that Pan is dead, yet now
Along the river's darkling edge
I saw the slender, silver sedge
As 'neath a fleeting footstep bow.
. . . . . .
And there I saw the river break
In gentle ripples, circling wide
As though some long dead naiad sighed
Beneath it for old loving's sake,

And fain would rise again and greet
Her goat-hoofed lover as he came
Beneath the clustered trees, aflame
To pipe his longing at her feet;

Where black against the rising moon
The mad Bacchante's wine-splashed crew
Hailed them as mates of theirs and drew
Them captive by the wide lagoon.

If it is not uncommon to find a capital sonnet or two embedded in a mass of otherwise indifferent work, so that a disproportionately large amount of good verse seems to be appropriated by this

stanza, the reason is not far to seek. Evidently, the poet, like other men, is the better for discipline. One such happy exception from Mr. Carruth's "Each in His Own Tongue" is too good to be left to take its chances:

In Etzel's land they sat long years ago
In the tense evening of that fatal day;
On Hagen's knees a naked sword there lay,
And Volker stroked his baleful fiddle-bow.
So the Fair Vengeance found them counselling low;
No greeting but defiance offered they
To her fierce menaces and kept at bay
With grim, sad eyes, the wily Hunnish foe.

When insolent Fate, with doom in either hand
Came lording on us as we sat alone
Before the battle, friend, we did not rise,
But each read fealty in the other's eyes,
And like those doughty Niblungs dauntless scanned
Her scowling ministers, and faced them down.

For all these new claimants to their attention, habitual readers of poetry will welcome none the less warmly a complete edition of Mr. Gilder's verse. Mr. Gilder has been writing so long and is so well known that he hardly requires characterization or illustration here. It is not ungrateful, however, to have the opportunity of quoting a few lines:

Great Universe—what dost thou with thy dead!
Now thinking on the myriads that have gone
Into a seeming blank oblivion,
With there and there a most resplendent head,—
Eyes of such trancing sweetness, or so dread,
That made the soul to quake that looked thereon,—
All utterly wiped out, dismissed, and done;
Lost, speechless, viewless, and forever fled!
Myriad on myriad, past the power to count;—
Where are they, thou dumb Nature? Do they shine,
Released from separate life, in summer airs,
Or moony seas, in dawns?—or up the stairs
Of spiritual being slowly mount
And by degrees grow more and more divine?

CURRENT FICTION.

Roads of Destiny. By O. Henry. New York: Doubleday, Page & Co.

Within a little less than a year O. Henry has published three volumes containing a grand total of about sixty stories. It is not right to infer that he has turned them out with the quiet regularity of the Saturday night sermon, for a good many of them made their appearance in periodical publications more than twelve moons ago. But on the evidence submitted one may easily suspect that he could have done so, had he wished. Of the particular type of short story which he produces, O. Henry is a perfectly assured master. Heeding the maxim of Goethe, he has worked in a strictly limited field. He has attempted no rivalry with Irving or Hawthorne or Poe. It is shocking to find him mentioned in the same sentence with them, for he has so limited his field as to exclude wonder, beauty, passion, terror. On the other hand, he has as sedulously avoided the risky formula of the naturalistic short story which has flourished in France. Never penetrating beneath the surface, he has furnished an astonishing amount of diversion by presenting the merely comic aspects of universal rascaldom. One picks up this new volume of tales expecting to find the familiar world of tramps, burglars, and adventurers a little cloying; but one lays it down at the end of the twenty-second tale—they run rather longer than those in "The Gentle Grafter" and "The Voice of the City"—with a conviction that the author is a peculiarly beguiling writer. He deals here largely with the picturesque riff-raff floating through the South and West—Mississippi, Texas, Mexico, and South America. He leaves one with no very distinct impressions of individual characters, but with a very lively sense of the general characteristics of the group. He has even imparted a kind of unity to the volume by an insistence throughout upon luck and fate as the divinities presiding over the lives of his people. The surprise-endings of which he makes a specialty are not all equally surprising, but one is reasonably certain of a sharply heightened amusement at the last page. "Art and the Bronco," "Phoebe," and "Two Renegades" have perhaps the most of narrative interest. The zest and fidelity of his frontier tales suggest that in the interest of posterity he ought to give us three volumes more of this sort for Porto Rico, Alaska, and the Philippine Islands.

The Hand on the Latch. By Mary Cholmondeley. New York: Dodd, Mead & Co.

It is hard to believe that the extraordinary preface here printed was actually written by way of introduction to the four tales which make up the volume. This is an utterance of an old-fashioned and well-nigh obsolete type—hardly paralleled in recent literature unless (to compare small things with greater) in Swinburne's late "Dedicatory Epistle" to his collected poems. It was still common enough two or three generations ago, as in some of Bulwer's prefaces; but we have come to expect greater reticence, or at least greater self-command. If an author has his grievances, he is usually content to air them in letters to the press, or through the vicarious offices of the literary gossip. But the present writer has harked back to the ancient method of prefixing a personal plaint to the literary product as offered for sale. The result is a lively, if undignified and irrelevant effusion, of some dozen pages. The articles of complaint are two: first, that the author of "Red Pottage," though she has "been writing books for five-and-twenty years," has found it difficult to make people believe that she wrote them; and, second, that she has been wrongfully, persistently, and maliciously accused of putting real people into said books, with intent to ridicule and decry. Her asseveration and denial are embroidered with anecdote and irritably facetious comment. To say the truth, one might not unreasonably hesitate to connect the authorship of the remarkably finished stories which make up the body of the book with that of this so-called preface. There appears to be nothing libellous in them. It may be that the Aunt Emmy of "St. Luke's Summer," and the supposed lady-author who tells the story called "The Lowest Rung," may be traced to real life by some imaginative English reader. The irony of the latter narrative is well-sustained, its stark substance surviving and shining through the wretched little affectations of the narrator. This note of irony is, in fact, characteristic of all these stories. Each of them dwells in its own way upon the uncertainties of human character. In each of them there is a contrast drawn between greatness and littleness of soul, the magnanimity appearing in an unexpected quarter, or in an unexpected guise. The title story—with its rather vague American setting—is perhaps the most striking of them.

Love Among the Chickens: A Story of the Haps and Mishaps on an English Chicken Farm. By P. G. Wodehouse. New York: The Circle Publishing Co.

This cheerful tale has its technical surprises. Whether or not they are worth while is a question; nevertheless, an author who begins his book in the third person, changes abruptly to the first, and ends with dialogue and stage directions, probably has reasons for his proceedings, and it would be interesting to know them. The ordinary reader is likely to believe that the author has, in his first change, abandoned a great advantage. The hero, who up to that time has been as amusing as the remaining characters, at once becomes, in his function of narrator, a semi-serious person, and subtracts by so much from the possibilities of the book.

Apart from this, the tale fulfils its aim of pleasant entertainment. Of the Jacobean school, yet with a higher social sphere than that preferred by the author of "Many Cargoes," it shows the actions of persons who take themselves soberly. They endeavor to manage a Devonshire chicken-farm, though they have little more than a hopeful knowl-

edge of the reproductive possibilities of the hen. Hope likewise forms the larger part of their capital. A dog and a cat enliven the situation. This venture is mixed up with a love affair, which in its turn is complicated by an irascible parent and a highly artificial rescue. A golf-match, cleverly managed by the author, who is well supported by the hero, brings about a happier end to the love affair than comes to the chicken enterprise. The book has brisk movement, and a bright style, which, though unable to handle the plot without shifting grips, is quite adequate to the minor incidents.

In the Wake of the Green Banner. By Eugene Paul Metour. New York: Charles Scribner's Sons.

This book borders perilously upon sound and fury with the Shakesperean connotation. The writer evidently has still to learn that a good story is not to be constructed entirely of local color and tumultuous action. A dash of barbaric color is as stimulating as a clash of brass—but a camaieu of scarlet and orange and an orchestra of cymbals leave one with a degree of weariness beyond the power of neutral tones to compass. The story will possess its greatest interest for those who have visited the places described and can thrill with pleasant reminiscence and proud recognition at sight of the Arab words and phrases that plentifully lard the text. It is doubtful whether such readers, however, will find their hunger to revisit the desert in any wise whetted by the adventures of Mr. Metour's characters, who stumble through a wilderness of battle, murder, and slow death by torture to a not altogether convincing happy end. It is hardly the book to choose as a travelling companion for friends about to sail for Africa.

Scheiternde Deutschen. Von Moeller van den Bruck. Minden i. W.: J. C. C. Bruns' Verlag.

Deutsche Geschichte. Von Einhart. Leipzig: Dieterich'schen Verlags-buchhandlung.

Concise, vigorous, and leaving no doubt as to what the author thinks, the volume from Van den Bruck, in his series on "Die Deutschen," may easily prove one of the notable volumes by a German dealing with the modern history of the country, and especially the reign of Emperor William. He approaches the present *Schauplatz* with a series of excursions into the history of the early Germans, and in this way seeks to point out how Germanic tradition has served as a foundation for the magnificent work of Bismarck and the Kaiser, and to what extent it must now be abandoned by those who would break with the narrower tradition and make of twentieth-century Germany a great nation of the world. Passing from a discussion of Goethe and his relations to the past, his own period, and the future—a future that in many respects Goethe never dreamed of, so that, to a certain extent, one may say that Goethe began with Walter and Wolfram and ended with himself—Van den Bruck reviews the raw, wild times of Armin, the tragic fate of Alarich, the brilliant exploits of Frederick I, and goes on to the more brilliant sway of Maximilian. The next stepping-stone he finds in Stein, the stanch opponent of Napoleon and the prophet of Prussia, who, like Goethe, Schiller, and many others of their time, was tempted to emigrate to America, being tired of the old régime, and allured by the prospects of the New World.

All these historical-biographical essays, which form the greater part of the volume and lead to the discussion of present-day problems in Germany, are just such studies as should be made occasionally for every nation, to stimulate a healthy interest in its past; and they contribute to a better understanding of the author's view, at least, of what Germany has come to be, or is striving after. In Bismarck, for example, another manifestation with Nietzsche of late German effort to reach the highest, Van den Bruck finds the embodiment of Armin, Barbarossa, and Stein. To a partial extent only have the Germans understood the greatness of Bismarck and what he did for Germany; but just as the Americans are coming more and more to realize the worth of Lincoln, so Bismarck each year grows in the hearts and minds of his countrymen, until already a certain kind of Bismarck-worship has been established. Nor has this appreciation of Bismarck suffered in the increasing recognition of Emperor William and his worth, a man whom Bismarck made, and who, in turn, tried to unmake Bismarck.

Wilhelm II is regarded as the true exponent of the present German people, at least in all matters pertaining to national or public life. He started public life as an optimist, and no one has done for Germany what he has accomplished in bringing industry to a high and successful stage, in insisting that Socialism, and other movements likely to entangle Germany through bonds of sympathy with other peoples, should be regarded solely as German problems, and in steering Germany as a great political power into a position of first rank among the other leading nations, and, keeping her there, all in all, as a great factor for peace. Where the Emperor has failed, and failed miserably, is that he has not stuck to his last as a political shoemaker, but has posed as an interpreter and dictator of the fine arts. It is not to be denied that, here and there, the Kaiser has shown insight into art, as when he suggested the Siegesallee and other innovations for Berlin, by which he expected to make Berlin the handsomest city in the world; but the environment of the Schloss in Berlin still remains a muddle, and some day, perhaps, the Kaiser will awake to discover that his whole dream of directing the art expression of his people has ended in fiasco. Meanwhile, through his leadership in some matters, and against his will in others, the nation is marching on, though somewhat scattered in energy; "business" is the one thought of the Americans, and "time is money" the controlling impulse of the English, while the Germans grope and experiment. Soon, however, they too must find a motto that will adequately express their mission in the century—their call to *do;* and perhaps it will be none other than the motto in English: "The Germans to the front!"

In "Deutsche Geschichte," by "Einhart" (probably Fritz Lienhard of Weimar), we have a popular history of the Germans in Germany and beyond the seas, of value to the foreign reader as showing the probable popular feeling in the Fatherland concerning various questions of moment. Judged by its treatment of the history of the Germans in the United States, the work is accurate and sympathetic. A good share of the credit for America's success, based on the service rendered to Washington by Herkheimer, Von Steuben, Kalb, and others, is claimed for the Germans, and some regret is expressed that, of the 5,000,000 Germans who came to the United States between 1820-1900, so little of enduring, distinctly German character should survive. There is also an interesting review of the Germans in Brazil and other parts of South America, coupled with the assertion that, "on the highest of state authority," it may be accepted that the Germans have never thought of establishing a political power on the Western Continent.

The Basis of Ascendancy: A Discussion of Certain Principles of Public Policy involved in the Development of the Southern States. By Edgar Gardner Murphy. New York: Longmans, Green, & Co. $1.50 net.

This is a volume intercalated between the author's "The Present South" and a new work of similar tenor which he is soon to publish. It seems to be not so much left-over material, as surplus philosophizing, which Mr. Murphy here utilizes. For the work is almost pure abstraction. The writer's mind seems to move most easily amid symbols. It is seldom that one reads a book which is so little drenched in fact. Mr. Murphy delights in such phrases as "the potential units of a demonstrated social

achievement," "racial repugnancies arising within the legislative indirections of the State"; he mentions scarce a name, cites no statistics, writes almost the whole time as it were *in vacuo*. This intellectual habit may be due in part to the confining ill-health from which he has so unfortunately suffered; but it certainly makes his book hard reading. One finds one's self longing for illustration, for hard realities, for anything concrete, after a long stretch of this metaphysics about "the negro" without the introduction of one actual and living black man.

Mr. Murphy has frankly—or is it unconsciously?—chosen for the title of his book a word which is steeped in tyrannical and hateful associations. The "ascendancy party" is the name by which Irishmen have for four generations reproached their oppressors. Mr. Murphy's "Ascendancy" is that of white over black in the South. He seeks to establish its philosophic basis. With all of his philosophy, if we understand it, it would be impossible for us to agree; but we can at least recognize a brave and generous spirit in this Southerner writing primarily for Southerners. By whatever dubious or halting theories he accounts for what has been done in the past, he faces the future as one who would see justice done lest white and black and all our political order perish together. Mr. Murphy is for negro education, for qualified negro suffrage, and, in general, for placing the open door of hope and opportunity before the colored men and women of the South. We can best indicate the attitude of this progressive Southerner, and best attain the purposes of our review, by quoting here and there from his pages:

> The fundamental issue is not what we will do with the negro, but what we—with the negro as the incident or provocation of our readjustments—will do with our institutions. . . .
>
> The arch-enemies of race integrity are those white men who have become the strident opponents of negro development. The fomenters of the race's despair are among the factors of its disintegration. The promoters of racial fusion, the real, though unwitting, apostles of amalgamation, are no longer the Abolitionists of the East, but those anti-negro extremists of every section who in their war upon the opportunities of this weaker race would put the foundations of its integrity upon the shifting and dissolving basis of its self-contempt. . . .
>
> The real question is not as to whether the worthy negro has, as yet, any very marked political capacity, but as to whether the attitude of the State toward such capacity as he has, is to be that of development or repression. Is it to the interest of the State that there should be perpetuated within its limits a vast politically excluded population, a population of permanent non-participants in the interests, inspirations, and responsibilities of suffrage? . . .
>
> Democracy is wholly consistent with the restriction of suffrage. It declares, however, that such restrictions shall bear no stigma of class, and that any fraction of our citizenship, under the provisions of the local State, shall be excluded—if excluded at all—only on the common terms.

Builders of Spain. By Clara Crawford Perkins. 2 vols. New York: Henry Holt & Co. $5.

The history of Spain, especially previous to the reign of Ferdinand and Isabella, is so little known to English-speaking readers that it affords a most attractive field for the conscientious and scholarly investigator. Unfortunately, the prevailing ignorance of Spanish history also furnishes an opportunity, too often improved, for untrained persons to put forth shallow and worthless volumes with considerably less risk of detection than if they followed more familiar paths. The present work is an egregious example of the latter class. Its first two hundred pages are occupied with a curiously jumbled account of the history of Spain from Celt-Iberian times to the present, which is little more than a series of glimpses of the biographies of different monarchs, selected arbitrarily and without rhyme or reason; the remainder consists of scattering descriptions, chiefly architectural, of the principal towns and provinces of the land, into which a host of the less credible legends of Spanish history are interwoven with consistent inaccuracy. Wrong dates, misspellings and mistranslations, loose and meaningless sentences abound. The arrival of the Visigoths took place in 414, but they did not "overrun the entire peninsula" until the later part of the sixth century, when Leovigild conquered the Suevi; both events, in this book, are crowded into the years 417-19. The dates of the reign of James the Conqueror are 1213-76, not 1214-74. The overthrow of the Ommeyades at Damascus occurred more than one thousand years earlier than this book would have us believe. "Covadonga" and "Covadongo" are alternately given as the scene of the resistance of Pelayo. Alfonzo II of the Asturias would scarcely have answered to the title "Il Castro." The "c" in "Provence" is invariably burdened with a cedilla. "Bertrand de Guesclin" is an unprecedented designation for the French warrior, and "Pomponias Mela" for the Roman geographer. We learn with surprise that Hapsburg Burgundy in 1500 "included Dauphiny"; and the statement that Richelieu, Mazarin, and Louis XIV were "the great protagonists of Philip III and Philip IV in the field of European statesmanship" is meaningless.

But it is useless to continue with other examples of this sort. Any one with time to waste can find plenty for himself. If the book contained any really valuable information, there might be some palliation for them, but it does not. It is as ill-arranged and ill-proportioned in its main features as it is untrustworthy in detail. Even the architectural descriptions, which are better than the rest, are clearly inferior to those in the standard works. The illustrations, which are numerous, well-chosen, and admirably executed, form the sole bright spot in the entire two volumes.

Science.

THE DARWIN CELEBRATION IN CAMBRIDGE.

Cambridge, Eng., June 26.

Representative scientists from all parts of the world have assembled at this university the present week to do homage to Charles Darwin. The occasion is the centenary of his birth and the fiftieth anniversary of the publication of the Origin of Species. The celebration was instituted by the university where he graduated, but the centre of the observance has been Christ College, where he studied. His room at the top of the second staircase in the first quadrangle was accessible to visitors, while a collection of memorials of the great scholar had been arranged in a series of rooms on the ground floor. This contained an interesting series of portraits of Darwin at different periods of his life, as well as of his distinguished father, Erasmus Darwin, and of his family; also the scientific instruments used by him in his famous five years' voyage in the Beagle, medals and diplomas conferred by various scientific societies; while upon the walls hung early caricatures and lampoons directed at his doctrine of the origin of species. The identical image of a monkey, in spectacles, with banjo, and in bright dancing costume, which was lowered from the gallery of the Senate House by wicked students when Darwin received the degree of doctor of laws in 1877, had also a place amid more sacred relics. Among the numerous manuscripts and letters is the original draft of the "Origin of Species," written in pencil upon large sheets. Later revisions, also present, show the author's unwearied care in revision and in the elaboration of details. The bronze bust of Mr. Darwin by William Couper of New York, which was presented to the university by Professor Osborn of the Museum of Natural History, stood at the head of one room and received very favorable comment.

The exercises began on Tuesday evening, with a reception of delegates and other invited guests by the chancellor of the university, Lord Rayleigh, in

Fitzwilliam Museum. The chancellor, in his official robes, stood at the head of the staircase and greeted all as they arrived. The scene was brilliant. The members of the Senate wore hoods and bands, the doctors scarlet, while the foreign delegates wore robes of various colors, the rectors of foreign universities mantles and chains. The grounds of Peterhouse College, which are connected with those of the Museum, were illuminated and were open for the reception of guests. The real exercises of the celebration began on Wednesday morning at ten o'clock in the Senate House with an address of welcome by the chancellor, and the presentation of and addresses by the delegates of the various universities and learned societies which were represented. There were about two hundred and forty delegates present; of these seventy-eight were from the United States and an equal number from Germany. The delegates were grouped according to countries, and announced in that order, beginning with America and ending with Switzerland, the British representatives following the foreign, beginning with the colonies in Africa and ending with the delegates from England, Scotland, and Wales. Among the most heartily applauded were Metchnikoff, Sir Oliver Lodge, and especially the sons of the great scientist, Sir George Howard Darwin, Francis Darwin, William Erasmus Darwin, and Major Leonard Darwin. Naturally, much time was consumed in presenting so many memorials. Brief addresses followed, eulogizing the work of Darwin, by Professor Hertwig of Berlin, in German; Professor Metchnikoff of the Pasteur Institute, in French; Dr. Ray Lankester, and Dr. H. F. Osborn. The last address was one of the most attractive of the occasion. Dr. Osborn said:

> Through John Harvard of Emmanuel, Cambridge became the mother of our colleges. Did not Emmanuel beget Harvard, and Harvard beget Yale, and Yale beget Princeton and other descendants to the third and fourth generation? They thus saluted the venerable but ever-youthful ancestor of many of the American universities, academies, and institutes of science, national and State museums represented here, and, in large part, guided by the true sons of the true daughters of the Alma Mater on the Cam. A son of Yale succeeded a son of Harvard as President of the United States. If your university men were leading the empire, theirs in America were leading the nation. To them Darwin, more than any other naturalist, seemed greatest in the union of a high order of genius with rare simplicity and transparency of thought. . . . In conclusion, they, the delegates, naturalists, and friends, desired to present to Christ's College as a memorial of their visit a portrait of Charles Darwin in bronze, the work of their countryman, William Couper, a portrait which they trusted would convey to this and future generations of Cambridge students some impression of the rugged simplicity as well as of the intellectual grandeur of the man they revered and honored.

Prof. Oscar Hertwig spoke in German of Cambridge as the centre of Darwin's influence, and referred to the immense effect of Darwinian thought upon the minds of German scientists. Professor Metchnikoff spoke impressively and with marked emphasis of the effect and the extent of Darwin's teaching in France. He laid especial stress upon Darwin's influence upon pathological research of the future of which he spoke most hopefully. Dr. Ray Lankester's address was more technical and not without a strong controversial suggestion, the only note of this kind in the entire proceedings.

In the afternoon, a garden party was given by the Master and Fellows of Christ's College to the delegates and guests. This enabled the guests to meet familiarly, to visit Darwin's room, and to inspect the Darwin memorials. The bewildering variety of academic costume and decoration was here witnessed to its full extent. Few of the guests could interpret the significance of the many fashions in the different universities, distinguishing the various faculties and degrees.

The banquet held on Wednesday evening was one of the most brilliant functions of the celebration. It was given in the new Examination Hall in Pembroke Street, which was used for the first time on this occasion. More than five hundred were present. Among the guests at the high table, at which the chancellor presided, were Prince Roland Bonaparte, who wore the costume of the French Institute; the Duke of Northumberland; the Rt. Hon. Arthur Balfour, in the scarlet doctor's gown of Cambridge; the Bishop of Ely; the Dean of Westminster; Sir Edward Fry, the representative of England at the Hague Conference; Viscount Esher, Master of the Rolls; Lord Collins, Mayor of Cambridge, and many others. The academic gown was generally worn.

The striking feature of the banquet was the address by the Rt. Hon. Arthur Balfour, who introduced the toast to Darwin. I have heard Mr. Balfour frequently in the House of Commons and always admired his readiness and versatility in defending any position which he assumed, involving often the most adroit dialectics, but I have never heard him, when the constructive and appreciative element in oratory was more beautifully and nobly revealed. Mr. Balfour's books have shown his capacity for clear and discriminating philosophic thought. The charm of his manner and his winning personality, which transform hostile opponents into personal friends, were never more delightfully manifested.

William Erasmus Darwin, the eldest son of Charles Darwin, delivered, with many touches of humor, a most simple and reverent description of his father in his home relations. This was a prominent note in all the exercises, namely, the beautiful nature of the great scientist. Other addresses at the banquet were by Professor Arrhenius of the Nobel Institute, Stockholm, delivered in very good English, and by Professor Poulton of Oxford. The chancellor said there were no lips from which a Cambridge man would more gladly hear his toast than from an Oxford man.

On Thursday morning a second and concluding exercise of the celebration was held in the Senate House. Twenty-one degrees were conferred upon the delegates, three upon Americans, *viz.*, Professor Loeb of the University of California, Professor Wilson of New York University, and Professor Walcott, secretary of the Smithsonian Institution. Other notable delegates who received this honor were Prince Roland Bonaparte, the grandson of Prince Lucien, one of the younger brothers of Napoleon the Great; Professor Perrier of the Institute of France; Professor Hoeffding of Copenhagen, and Francis Darwin, "one of the illustrious sons of his father," as the public orator announced. Professor Sandys, the golden-mouthed orator, was never more happy than in his characterizations, in classical Latin, of the achievements of these modern heroes of science. The public orator must possess an omniscient knowledge of the attainments of every candidate; Professor Sandys is tall, with a face of striking intellectuality. He portrayed Prince Bonaparte "as a second Cæsar, bearing his victorious eagles to a new world." Surely, only carping criticism can call in question such a felicity of expression, even if exuberant in praise, on an occasion like this. Much regret was expressed at the absence of Darwin's great friend and compeer, Alfred Russel Wallace, from the exercises, whose age alone prevented his presence. A telegram of salutation was sent to him by the delegates through the vice-chancellor.

The final gathering, apart from a meeting held by the Royal Society, was of a personal character, and was held in the cloisters of Trinity College. The members of Charles Darwin's family welcomed the delegates and invited guests.

Thus closed one of the most notable gatherings in the history of science. Probably no other name among the brilliant discoverers in science of the last century could have attracted such a gathering. Much of the credit of the success of the undertaking was due to the honorary secretaries, J. W. Clark and A. C. Seward, but mainly to the latter.

W. T. Hewett.

The Fireless Cook Book. By Margaret J. Mitchell. New York: Doubleday, Page & Co. $1.25.

Great as is the number of culinary guides, none of them competes with Miss Mitchell's "Fireless Cook Book," which touches fresh ground and marks a new epoch in the art of preparing food. If housewives throughout the land understood the bearing of the book on their comfort and happiness, it would be the "best seller" of the year. As the author remarks:

> Does the idea appeal to you of putting your dinner on to cook and then going visiting, or to the theatre, or sitting down to read, write, or sew, with no further thought for your food until it is time to serve it? It sounds like a fairy tale to say that you can bring food to the boiling point, put it into a box of hay, and leave it for a few hours, returning to find it cooked, and often better cooked than in any other way. Yet it is true.

The fireless cooker has long been known to Norwegians, and in Germany its use is becoming quite general. In this country the army has found it a great boon, and families are becoming gradually interested in the wonders told of it. Not a few of the adventurous women, however, have been disappointed in their experiments with it, and have come to the conclusion that it is not practical, has too limited a scope, fails to cook starchy food, and that there is little economy in using it. What these women needed was a guide to show them that the fault was not with the cooker, but with the cook. Miss Mitchell points out that, in reality, there is a saving of up to 90 per cent. in fuel, beside the great saving of time already referred to; that with the aid of the insulated oven, which is the latest development of the fireless cooker, and to which she devotes a special chapter, the variety of foods that can be cooked in this way is greatly increased; that the absence of heat and odors in the kitchen is an advantage not to be overlooked; that in the matter of flavor there is a distinct gain in fireless cookery, and well-flavored food is not only more enjoyable but also more digestible than such food as is usually cooked in our kitchens; and, finally, that the bearing of fireless cookery upon the servant problem is of superlative importance. As the author remarks, "when cooking no longer ties one to the kitchen, is no longer a labor that monopolizes one's time, dishevels one's person, and exasperates the temper, the cook may go. We shall save her wages, her food, her room, and her waste, and have more time to spend in ways that bring a more satisfactory return." No doubt, in due course of time, there will be experts who will take care of our cooking boxes. One man or woman could easily visit a dozen houses each forenoon, start the lunches and dinners, return in the afternoon to prepare for the breakfast; and the cost per family would be small.

Fireless cookers can now be bought of various sizes and degrees of efficiency. Miss Mitchell's book gives clear directions also to those who wish to make their own hayboxes. No phase of the question is overlooked. She has found that full understanding of the management of the boxes has resulted in complete success, "followed inevitably by enthusiasm"; but there are pitfalls to be avoided, among them overcooking and undercooking, but these can readily be shunned by following her advice. The question of seasoning is discussed, and there are chapters on soups, cereals, various kinds of meats, desserts, etc., with hints as to how to tell good material from bad. In short, it is a complete cook book for the fireless method up to date; there are recipes telling how long each kind of food should remain in the cooker; menus for various occasions; recipes for cooking in small or large quantities, or for the sick; and there is an appendix relating to experiments illustrating the scientific as well as the practical side of fireless cookery.

SIMON NEWCOMB.

Prof. Simon Newcomb died at his home in Washington early Sunday morning of cancer, the first symptoms of which appeared last September. The members of his family were at his bedside when the end came. Though of American lineage, he was born in Wallace, Cumberland County, Nova Scotia, on the 12th of March, 1835. He was educated at home, but in 1853 left Canada for Maryland, where he found employment as a teacher for two or three years. Then he had the good fortune to form the acquaintanee of Joseph Henry, secretary of the Smithsonian Institution, and Julius E. Hilgard, superintendent of the United States Coast and Geodetic Survey, who were greatly impressed by his aptitude for mathematics, and in 1857 secured his appointment as a computer on the United States Nautical Almanae. The office of the Nautical Almanac was then in Cambridge, which gave the young scholar an opportunity to enter the Lawrence Scientific School, from which he was graduated in 1858, remaining three years as a graduate student.

While in Cambridge, he found time to plan and execute a notable piece of astronomical work. This was the computation of the orbits of the asteroids revolving about the sun between Mars and Jupiter. His first calculations were made on four of the asteroids in 1859, and attracted much attention when presented at the meeting of the American Association for the Advancement of Science at Springfield, where he exhibited a diagram showing the changes in the orbits during thousands of years. In 1860, he published his general mathematical theory on this subject, and the treatise quickly won for him an international reputation.

In 1861, he was appointed professor of mathematics in the United States navy and transferred to Washington. In 1870, having been already elected a member of the National Academy of Sciences, he was sent to observe a total eclipse of the sun, visible on the Mediterranean, and established a station at Gibraltar. Unfortunately, the principal observations were prevented by clouds, but he seized the opportunity to make certain original studies concerning the minor motions of the moon. Lunar tables showing the recognized motions of the moon were already in existence, notably those constructed by Hansen and published by the British government in 1857; but even before 1870, it had been found that the observed positions of the earth's satellite did not correspond with the computed positions, as shown by error in the calculation of the eclipses and in other ways; but the problem had not been solved. Newcomb at once attacked it, visiting different observatories and consulting the earliest records extant. The task was not abandoned until formulæ had been found for constructing accurate lunar tables.

He now applied himself to the accurate determination of the "elements of the solar system," including the measurement of the dimensions, weights, and orbits of the principal planets, the larger asteroids, and the more important satellites or planetary moons. This work was carried forward in connection with official duty as opportunity offered. As early as 1867 he had published a final memoir on the secular variations of the orbits of the asteroids; this was followed in 1874 by results of investigations concerning the orbit of the planet Uranus. The final researches into the motions of the moon were published in 1876, and other results were set forth at frequent intervals in official reports, as well as in unofficial scientific papers.

In 1877 he was appointed senior professor of mathematics in the United States navy, with the relative rank of captain, and superintendent of the Nautical Almanac Office, which he held until 1897, when he retired with the relative rank of rear-admiral. In 1884 he was appointed professor of mathematics and astronomy in Johns Hopkins University. This post he resigned in 1893, but was reappointed in 1898. For a number of years he was professor of astronomy at Columbia University, and his services were called into requisition, of course, when the Lick Observatory, in California, was in course of establishment. He helped materially in the preparation of the equipment, and passed on the glass and mountings of the great telescope.

A list of the various volumes and essays published by Professor Newcomb would fill several columns. Among the most important may be mentioned those "On the Secular Variations and Mutual Relations of the Orbits of the Asteroids," "An Investigation of the Orbit of Neptune, with General Table of its Motion," "Researches on the Motion of the Moon," "Measure of the Velocity of Light," and "Development of the Perturbative Function and its Derivative in Sines and Cosines of the Eccentric Anomaly, and in Powers of the Eccentricities and Inclinations." He also wrote a series of textbooks on algebra, geometry, trigonometry, logarithms, calculus, and astronomy, besides his well-known general

work on "Popular Astronomy." On finance and political economy he published several books, including the "A, B, C of Finance," and many articles in the magazines. One of his latest essays was on the subject of aeronautics. He thought that airships might be useful in scouting expeditions, but doubted whether they could ever be developed for carrying freight or passengers commercially.

He was a member of the leading scientific societies of this country, including the American Association for the Advancement of Science, of which he was president in 1877, and the National Academy of Science, of which he was vice-president from 1883 to 1889. He was the first president of the American Society for Psychical Research. During his long and busy life he was the recipient of all the ordinary and many special honors from most of the learned institutions and associations of the world.

Samuel Edward Warren, at one time professor of descriptive geometry in the Rensselaer Polytechnic Institute, and afterwards in the Massachusetts Institute of Technology, has died at the age of seventy-seven. He published a long list of text-books, beginning with "General Problems in Descriptive Geometry" (1860), and ending with "Descriptive Geometry" (1904).

A dispatch from Paris announces the death last Sunday of Henri-François Peudefer de Parville, the scientific writer and editor of *La Nature*. M. de Parville was born in 1839, at Evreux. He was an officer of the Legion of Honor, and had received decorations from Italy, Turkey, and Greece. He wrote many articles on scientific subjects for the *Journal des Débats*, the *Journal Officiel*, and other publications. His books are: "Causeries scientifiques," "La Planète Mars," and "La Clef de la Science."

Art.

Geofroy Tory, Painter and Engraver: First Royal Printer; Reformer of Orthography and Typography under François I. An Account of His Life and Works, by Auguste Bernard. Translated by George B. Ives. Boston: Houghton Mifflin Co. Edition limited to 350 copies. $37.50 net.

Of Geofroy Tory, royal printer to François I, classical scholar, poet, reformer of French orthography, bookseller, designer, miniaturist, so high an opinion has existed among collectors that the lack of an authoritative biography in English and of means of becoming familiar with his crisp designs has been a constant surprise. This is actually the first English translation of Auguste Bernard's "Geofroy Tory, peintre et graveur," the earliest edition of which was published in 1857, the second edition, embodying later discoveries, in 1865. No other work has since appeared in rivalry to this. The thoroughness of M. Bernard's researches has been attested by A. W. Pollard of the British Museum Library, who has said that "they are so well done that no one has any excuse for going over the ground again." The same authority several years ago regretted that no French publisher since the development of modern processes of reproduction has had the enterprise to substitute proper illustrations for the meagre and not particularly faithful woodcuts which accompany M. Bernard's commentary, and which have so disappointed readers, unfamiliar with the originals.

M. Bernard's monograph, as revised by him in 1865, was divided into three parts: biography, bibliography, and iconography. Certain supplementary facts are given in appendices. The biographical sketch contains all that patient research has unearthed regarding the artist's career. He was born in humble circumstances at Bourges about 1480. Under favoring patronage he studied at the local university, and afterwards in Italy, of which he always retained a grateful memory. In 1504 he went to Paris to fill a professorship and to edit post-classical Latin authors. When he began to take interest in typography is uncertain. It was apparently before he made a second journey to Italy, on returning from which in 1518 he began to practice engraving. The death of a favorite daughter, Agnes, in 1522, led to his adopting as the mark of his bookshop, a sign of his own grief, the Pot Cassé, with its broken jar signifying the dissolution of the body; the toret which pierces it, Fate; the three chains and padlocks, the closing of life by the three fatal goddesses. Many variants of this symbol appear in books which he printed. The results of the printer's studies in the French language and his indignation against the *rufients*, who were changing its nature on the pretext of perfecting it, appeared in the recondite illustrated book, "Champ Fleury," devoted to theories of typography and language, which was published in 1529, and which made important recommendations leading to genuine linguistic reform. In 1531 Tory was appointed King's Printer to François I, being the first to hold that office. He died not long after, probably between June and October, 1533.

M. Bernard's bibliography describes minutely the books "that we owe to Tory, whether as publisher, as author, or as bookseller and printer"; the iconography gives the works "which he enriched with his paintings and engravings during twenty years of his life."

The justice of Tory's fame appears in any survey of his influence upon contemporaries and immediate successors, or of recent developments in the printing art. His versatility and industry were almost incredibly great. M. Bernard, indeed, maintains that scarcely an illustrated volume of any consequence was published in Paris during the first half of the sixteenth century which does not embody designs and decorative ideas evolved or suggested by Tory. A score or more of fellow engravers and booksellers employed him to engrave their private marks. His vignettes, marks, and symbols were copied by printers of his own and other countries during a long period. Ornamentation, for instance, plainly derived from Tory, has lately been noted in specimens of early American colonial printing. For a man whose first training was literary, his draughtsmanship was highly competent. There is some doubt as to the extent of his achievements as a painter; yet the productions of the miniaturist of about 1520, which are signed respectively "G" and "Godefroy," are attributed by M. Bernard, with apparently good reason, to our Tory. As one of the foremost philologists of his time, and an enthusiastic patriot anxious to contribute to the improvement of his mother tongue, he was responsible for fixing many of the French forms, supplying accents and the cedilla, and settling important questions of orthography. Above all, he impressed upon his age the value of simplicity, proportion, harmonious color, logic, sanity—qualities which were conspicuous in the best French typography for a long time after his death, and which, it is needless to say, have become national characteristics.

The lessons in style taught by Tory to his contemporaries have been effectively re-read among most of those present-day printers who, in plying their trade, try also to practise a fine art. In contradistinction to some of the arts and crafts which affect Gothic and mediæval models, the printing art, following the example of the finest work of the Italian and French Renaissance, has come to depend for its effects upon clear, beautiful type, good paper, and well-proportioned type-pages. The black illegibility of books supposed to be artistic in design because archaic in appearance has been succeeded by an agreeable grayness of tone and by the legibility that is the first mark of good printing. Style is less often than formerly confounded with mannerism

The reputation of the Riverside Press Editions as works of fine art, done under the personal supervision of Bruce Rogers, will be sustained by this publication. Although illustrated with reproductions of designs of varying sizes, shapes, and color, selected from many sources, and hence lacking in the unity that may be achieved when all the decorative elements have been designed to create a single impression, the "Tory" is likely to have a high place in the series that began about a decade ago with the publication of the "Sonnets and Madrigals of Michael Angelo." The pages, viewed individually and in pairs, are invariably agreeable; although, seen serially, their transition from one kind of design to another, or to no design, is

sometimes a little abrupt. The font of type specially cut by Mr. Rogers for this edition is admirable for its purpose. It is based, naturally, upon the Caslon, but with such modifications that a type-page of the modern book, on a creamy hand-made paper, closely resembles a characteristic page of one of the better-printed books of Tory's time. It is a type laudably free from affectation. Judged, indeed, by D. B. Updike's dictum, that "the better the style, the less dependent it is on 'earmarks' or archaisms, peculiar decoration, or whimsicality," this new Riverside Caslon is nearly perfect. The footnotes are in ordinary Caslon.

The treatment of the problem of reproducing Tory's ornament deserves especial commendation. So competent an admirer of the artist's work as Mr. Pollard has said that the faithful redrawing of Tory's brilliant and dignified designs is the only method by which they can be made to take their proper place in relation to the type, while adequately preserving the character of the originals. The limitations of direct photography, when it is a question of translating feeling as well as fact, are obvious. The reproduction of accidents of coloration due to age, and of irregularities resulting from imperfect or careless presswork; the appearance of the half-tone on a kind of paper for which, if it had existed in Tory's time, a very different illustrative treatment would have been adopted—these and other infelicities have been avoided in the present work by exact redrawing of a number of characteristic designs. Some of the resultant pages are more agreeable than others, for Mr. Rogers's type, although harmonizing perfectly with the lighter, grayer designs, is a little overpowered by the blacker ornamentation which Tory affected at one time. Everywhere, however, there are evidences of an effort to reproduce the *printed feeling* of the best work of the sixteenth century, and to conform at the same time to those general principles of the printing art, adherence to which is giving us to-day, amid the immense output of wretchedly done books, not a few notable examples of simplicity, reserve, and right sentiment.

Mr. Ives's rendering of the French text is accurate and painstaking, but now and then leaves the reader a little conscious that it is a translation.

More than a year ago the Italian Parliament appropriated 6,000,000 lire for the purchase and excavation of the so-called Monumental Zone. This is a sector extending from the Arch of Constantine as a point and spreading towards the Porta S. Paolo (formerly Porta Ostiensis) and the Porta Latina. It encloses the Baths of Caracalla, and includes the inner slopes of the Cælian and Aventine hills. The reservation of this space is perhaps the great archæological event of our times. There was always danger that the growth of the city would cover this site, that avenues inconsiderately laid out might lock up acres of ground rich in monuments, that ditching for drains, gas, etc., might actually destroy many valuable remains. Such dangers are now measurably averted, though the Royal Commission on the Monumental Zone must still count upon the good will of Parliament and the municipality. Meanwhile, a good beginning has been made in expropriating the land. On June 24, Commendatore Boni presented an elaborate plan of campaign which the commission promptly accepted.

At the Arch of Constantine the neighboring foundations will be examined and the old Via Triumphalis (now Via di S. Gregorio), broadened to its original extent, or at least sufficiently to give an adequate vista toward the Arch. At the south end of the Palatine the remains of the monument of Septimius Severus will be sought. Here the ancient marble plan of Rome indicates the presence of fountain niches. If possible, these will be again supplied with water. At the Circus Maximus the level of the via Antoniniana will be reached and at the curve of the Circus the foundations of the Porta Pompæ, built 81 A. D., should come to light. Toward the Porta Capena the ancient roads as they are traced will become walks bordered with laurel and myrtle, plants which surrounded, we read, the neighboring temple of Venus Vertieordia. To determine the position of the Porta Capena itself will be one of the main objectives. This will involve going down to the level about the Baths of Caracalla, thus revealing their grandiose foundations. At this gate might be found the sepulchre of the Horatii, mentioned by Livy, and more certainly the arches of the Appian aqueduct of 312 B. C. Outside should appear traces and perhaps more of the temple built by Marcellus in the third century B. C. Only the vigilance of the Commission prevented the cutting of a drain through this most sacred site. Near by should be also the altar of Honor and Virtue set up by Augustus in the year 19 B. C.

The opening of the Appian Way will be ascertained, its bordering tombs cleared, and the sites of the triumphal arches of Verus, Trajan, and Drusus (so-called) examined. The intramural portion of the Via Latina will be widened to include the bordering tombs, and the city will be petitioned to reserve this road as a pleasure drive. Upon the Porta Metronia, which was narrowed in the Middle Ages to the mere postern it now is, three Roman roads with a united width of 140 metres converge. Accordingly, this must have been a monumental gate and the Commission will investigate its original form. The Commission will buy the triangle between the Appian and Latin ways, which contains many patrician tombs of the Republic, but for the present will not excavate in this area.

Throughout the Monumental Zone sculptural and architectural remains will be so far as possible left in place, trees and shrubs will provide shade, and the ancient fountains will be restored. Under this genial project of Commendatore Boni there is work in hand for many years. It is to be hoped that the Royal Commission which has already approved the plan in principle will now provide for its systematic and continuous execution. The important thing seems to be a simultaneous advance. The piecemeal methods which have been followed in too many excavations involve inevitable interruptions in the work and faulty coördination—needless waste, that is, of time and money. The generosity of Parliament should quicken in these administrators a corresponding imaginative and magnanimous attitude toward their task. The pathway of the imagination will prove to be also that of economy and efficiency.

The following awards have been made by the Académie des Beaux Arts: The Prix Estrade-Delcros (8,000 francs) to François Émile Ehrmann; the Prix of the Société Française de Gravure (1,400 francs) to A. Lamotte; the Prix Ary Scheffer (6,000 francs) to M. Boutelié; and the Prix Durand (3,000 francs) to A. F. Desarrois.

We regret to report the death on Monday of Louis Loeb of New York, the well-known artist and illustrator. Mr. Loeb, who was forty-two years of age, was staying at his summer home in Canterbury when he died. When he was nineteen, he drifted to New York, and joined as a student the Art League, of which he became president in 1889. He went to Paris, where he spent several years, his principal master being Gérôme. He gained in his first year there the *premier prix d'atélier* at the Beaux Arts, and his pictures were hung on the line at the Salon. In 1896, he exhibited there two portraits, one of which received honorable mention. About the same time his illustrations in the *Century Magazine* of Janvier's article on the Greek plays at Avignon attracted much attention. In 1901 he was elected an associate of the Academy, and five years later he became an Academician.

From London comes the report of the death of A. W. Bayes, the painter and etcher. Mr. Bayes was in his seventy-seventh year.

Gustave Jacquet, the French painter, died in Paris Monday at the age of sixty-seven. He was a pupil of Bouguereau and made his début at the Salon of 1864 with two genre pictures, Modesty and Sadness; but it was not until three years later, when he exhibited The Call to Arms, that he attracted any attention. His Sortie de Lansquenets of 1868 was bought by the state. He is principally known in this country by his pictures of women, for most of which his wife posed.

The death is announced of Louis Marchetti, a native of Rome, who had studied under Fortuny. He lived for many years in France and exhibited at the Salon.

Dr. Richard Muther, the well-known art critic and professor of the History of Fine Arts at the University of Breslau, has died at the age of forty-nine. His "History of Modern Painting" is much consulted by English readers. Among his works in German are the following: "Anton Graff," "Die altesten deutschen Bilderbibeln," "Geschichte der Malerei im 19. Jahrhundert," "Geschichte der Malerei," "Studien und Kritiken," "Lucas Cranach," "Geschichte der englischen Malerei," "Renaissance der Antike," "Leonardo da Vinci," "Francisco Goya," "Rembrandt," "Geschichte der belgischen Malerei," "Millet," and "Courbet."

Finance.

CROPS AND TARIFFS.

The basic character of our country's wealth may be far better inferred from the crop report, just issued, than from the rumors that will soon leak through the cracks of the tariff conference committee room. The abundance promised on a million broad prairies quite dwarfs the results, whatever they may be, that shall emerge from the covert network of Congressional intrigue. The ordinary citizen feels for Congress something of the superb contempt which the English lord felt towards his niggardly steward. The steward complained that the lord's heir was wasting his father's goods, and got for a reply the indifferent remark: "I believe there is a good deal to waste." So Brother Jonathan, viewing his three billion prospective bushels of corn, is largely indifferent to the feverish anxiety at Washington about rates and schedules and drawbacks and customs courts.

How vital the yield of agricultural staples is to our real industrial welfare, may be gauged by the very genuine solicitude that expresses itself in market quotations when an unexpected turn for better or worse is announced by telegraph. The government report on cotton a few days ago created almost a riot upon the cotton exchanges; whereas the final vote in the Senate upon the Aldrich bill is received with a languid apathy, too profound to simulate the pretence of interest.

The explanation of this attitude of the public mind may best be seen when we try to realize the magnitude of the impending harvest. Of corn alone, there is standing over 109,000,000 acres, more than 7 per cent. gain over last year. The average condition is 6½ per cent. better than last year. The statistician of the Produce Exchange estimates on this basis a total yield of over 3,160,000,000 bushels, almost 500,000,000 bushels more than last year, and over 200,000,000 bushels in excess of the record crop of 1906. In its money value, the corn crop has long exceeded the total value of wheat. Although corn has not yet rivalled wheat and cotton as an article of export, its importance as food for live stock, as also for men, has made it the agricultural crop par excellence in this country. The bumper corn crop will be the more welcome also because hay, timothy and clover, does not quite attain the dimensions of last year. The broad distribution of corn gives it an additional importance. It is grown in every American latitude. Texas stands third only to Illinois and Iowa in corn growing, while four of the nine leading States in this staple are in the South. But while corn bulks largest in Ceres's cornucopia, there is plenty of room for other grains. The oat crop is just short of a billion bushels, and is only slightly surpassed in size by the record-breaking crop of 1902. Even wheat, whose price with that of flour has risen of late, promises to come within a million bushels of last year's output. The holdings of this prime cereal in farmers' hands have been reduced, however, by something like 15,000,000 in the twelve months past. The auxiliary staff of life, the white potato, covers a larger acreage than last year, while only the apple crop has refused to be coaxed back to the proportions it reached in 1908.

The statistics of raw materials imported for the fiscal year ending June 30, while not yet complete, presage almost unmistakably a favorable year for manufacturers. Measured by tale and weight, the raw materials laid down in our ports have broken all records. Their declared valuation, it is true, falls nearly $100,000,000 below the valuation of 1907. This is due to the world-wide recession in prices. But the abundance of crude materials, combined with their low purchase price, doubles the advantage of the manufacturer. It is likely that the prospect of increased rates of duty has induced many importers to lay in heavier stocks than they would have done otherwise But, with rising prices for the finished product, they will have made a profitable venture. Among the notable items in the inventory of imports are silk and India rubber, both of foreign production exclusively, and hides, skins, vegetable fibres, wool, copper, tin, lumber, and cotton. In silk, the prospects are for a total entry of 23,000,000 pounds, as compared with a previous maximum of 17,500,000 pounds. On the other hand, the aggregate price paid promises to reach $79,000,000, as compared with the previous maximum outlay on raw silk of $70,000,000. Raw wool imports give promise of attaining the grand total of 266,000,000 pounds—exceeded in quantity only in 1897. Crude India rubber will approximate 86,000,000 pounds—nine million in excess of any previous year's takings. Hides and skins will run well ahead of the earlier record, in 1906, of 425,000,000 pounds, though their values are far below those of 1906 or 1907. So far as cotton and tobacco are concerned, the imports are of kinds and qualities which supplement the domestic product. Of the latter, this year's importation will again break the record, while the amount of cotton will fall below the figures of 1902 and 1907 only.

While only the values, and not the physical qualities, of foodstuffs exported are as yet reported, the higher prices of food are shown very clearly to be traceable to the relatively short supplies that were forthcoming last year. Thus, corn exports fell in value from $33,000,000 for 1908 to $24,000,000 for 1909. Wheat showed almost precisely the same relative decline, from ninety-nine millions in 1908 to sixty-six millions in 1909. As was to be expected, meat and dairy products, which are essentially only allotropic forms of the cereal output, declined from one hundred and seventy millions to one hundred and forty-six. The fall in the value of cotton exported was doubtless traceable in part to a somewhat relaxed demand for the raw material. But the decline in export values of staple was only from four hundred and thirty-seven millions to four hundred and seventeen millions.

The Nation.

NEW YORK, THURSDAY, JULY 22, 1909.

The Week.

President Taft has at last spoken out on the pending tariff bill, and his trumpet gives no uncertain sound. It was straightforward, and it was also sagacious, for him to let the public know what he said to the twenty-two Republican members of the House, who went to him to protest against free raw materials and lower duties. The President's reply is a notification at once to Congress and the country. If words are half-battles, such a statement as his is a whole battle. Mr. Taft feels himself the representative of the whole people, obliged, as he says, to take a "broader point of view than that of a single member of Congress in respect to articles produced in his district." Somebody must speak for the consuming masses. Somebody must consider good faith with the people. In declaring flatly for a downward revision of the rates, and maintaining that the Republican party is in honor bound to give it, President Taft openly antagonizes Aldrich and gives the lie to Senator Lodge, but that will only increase the country's sense of indebtedness to his courage. The response of the people will, we are convinced, come up to the White House like the sound of many waters. The whole situation is changed by this explicit and manly utterance of Mr. Taft's. The Aldrich bill is dead. If it is not cut to pieces in conference, it will be vetoed by the Executive. But the chances are enormously in favor of the President's getting what he wants from Congress. This will be, not simply because he wants it, but because the country demands it.

One of the refreshing things in President Taft's tariff deliverance is his reference to American "energy and enterprise," together with the "effectiveness" of American labor and the "ingenuity" of our inventors. These qualities, taken with our unsurpassed natural resources, ought to be, in the President's opinion, a sufficient dependence in the case of most businesses, and ought to tend steadily to bring down the cost of production. Mr. Taft puts with much force the older theory of protection, according to which a temporary aid against foreign competition would enable domestic manufacturers so to perfect their methods that they would soon be independent of protective duties, and would be willing to have them reduced or abolished. But our insatiate protectionists have, of course, left all that far behind. The bigger their profits, the higher they want the tariff. With them, protection has become the means of making laziness and inefficiency successful. The oldest and most obsolete mill must be enabled by the tariff to pay fat dividends. Mr. Taft's statement is of a sort to stop the mouths of fair and honest protectionists, but nothing but blood can stop the mouths of the horseleeches that have fastened themselves upon the people under the pretence of protecting them. If anybody does not believe this, let him consider the way in which the President's moderate utterance has filled with rage the secretary of the Home Market Club of Boston. Col. Clarke is simply "amazed" at the President's taking up with "the entering wedge of free trade." His only consolation is that Mr. Taft "does not understand the tariff question." But that is just it; he understands it all too well, and so does the country, to be imposed upon any longer by the organized appetite of the Home Market Club.

Considerable opposition was made in the House last week to the appropriation of $25,000 for the travelling expenses of the President. It was attacked mainly on party lines, though a few Republicans joined the Democrats in voting against it. There appears to be no doubt, however, that the urgent deficiency bill will finally include this item. Charges of bad faith were made by Congressman Clark, for the Democrats, on the ground that, when the President's salary was raised from $50,000 to $75,000, the increase was understood specifically to cover travelling expenses. On the other hand, it is alleged that the salary was fixed at $75,000, instead of $100,000, in the general expectation that an extra $25,000, or so much thereof as might be necessary, was to be voted for the expenses of the President when travelling on public business. But these "understandings," whatever their tenor, are no part of the record. The money will be voted irrespective of them.

The lawfulness of such an appropriation has been sharply challenged. But it is doubtful if anybody would ever take the matter into the Supreme Court, and pretty certain that the judges, if it did come before them, would validate the appropriation. The money is not for the President's private purse. He may not expend it as he sees fit. It is limited to the one purpose of incidental travelling expenses—such as those which the Government pays in the case of an Indian Commissioner or Assistant Attorney-General—and any balance unexpended for that object must be covered back into the Treasury. The main question concerns, not the money for the travels, but their purpose and value. Unless a President has some definite object to accomplish, some message to deliver to his countrymen, some important public policy to expound and advocate, he might better stay in the White House. There are, admittedly, a certain number of ceremonies and celebrations at which it is well for the President to be present in his official capacity—as Mr. Taft has just been at Norwich and Lake Champlain—to lend dignity to the occasion and to speak, if possible, words of wisdom. But such functions aside, there is little use or propriety in the President travelling about the country merely to ingratiate himself with the people.

Mr. Bryan's appeal to the President to give the people the chance to vote upon a constitutional amendment for the direct election of United States Senators is adroit, but not momentous. Mr. Bryan has learned the art of keeping in the public eye. When a noted opponent of Mr. Bryan's was put in a pillory by a legislative resolution of rebuke, he broke its force by a dramatic long-distance horseback ride. When Mr. Bryan sees some of his thunder being appropriated, he keeps under notice of the masses by suggesting publicly that more of his thunder be stolen. The truth is that States which very strongly desire

the direct election of United States Senators practically secure this desideratum by requiring pledges of candidates for the Legislature. The issue of the direct election of Senators is not likely to be injected into the present arena of national politics at any man's dictum.

With New York's Public Service Commission become so wretched a failure and farce (taking the word of some people for it), one can but be surprised that other States should think of following the mad model. Yet, somehow, Gov. Hughes's plan of dealing with public-service corporations by means of a commission with ample and appropriate powers continues to receive the flattery of imitation. Early proposals for public-utility commissions came to little, in both New Jersey and Connecticut. Corporation influences, particularly in the latter State, were powerful enough to prevent action. But just now in Connecticut there has been put out by the special legislative committee the draft of a bill to place all telephone, gas, and water companies under control of a board of three commissioners. In the opinion of the Hartford *Courant*, the measure is one which will "work large and most beneficial reforms, and grow in favor." What, after Gov. Hughes's abject failure?

To a lover of contrasts in character and point of view, the meeting in Paris between Samuel Gompers, president of the American Federation of Labor, and the French labor leaders is suggestive. Mr. Gompers is known as an adept in dodging an issue. He is, among people interested in sociological matters, a "practical" man, in the sense that it is always a condition and not a theory that confronts him. Going to Paris to be instructed in labor conditions there, he has come in contact with leaders who in training and temperament are his exact opposites. He is conservative to the point of hating a general idea; they are radical to the point of caring little for conditions which, however, they may intimately know. The idea of revolution is to Mr. Gompers a nightmare. Revolution in France is a familiar social idea, and the leaders of the French Federation are openly revolutionary. Mr. Gompers has recently come to think that the labor organizations should go into politics, as is the case in England. Organized labor in France, on the other hand, is suspicious of politics, and its leaders frankly say that their representatives in the government could not, even with the best intentions, really represent labor; they could not "overcome the atmosphere of the House," as they say in England. The French leaders have clear and simple ideas which they develop with violent logic. They belong to the "intellectual" class. They will find it difficult to understand Mr. Gompers, and for this Mr. Gompers will not be sorry.

At the recent meeting of the Northern Baptist Convention, in Portland, Oregon, was read the report of a commission on Baptist denominational journalism. Baptist papers, like those of most other religious denominations, exist only at a poor dying rate financially. The ownership of denominational papers by the convention itself was dismissed; and the suggestion that the convention raise a fund to be loaned to the papers according to need met the same fate. The commission favored a combination of existing Baptist papers, so as to leave but one for New England, one for the Middle States, one for the Central West, and one for the Pacific Coast. The report recommended that the convention should use all its influence to build up these four papers. This report was adopted "with apparently no dissent." It may be questioned if this course is not as sure to hinder independence in denominational journalism as either of the plans rejected.

The real difficulty with religious journalism to-day is that it tends to live on denominational patronage, rather than to make a place for itself by merit. The desire for more local religious news and comment than the secular paper can give, occasions a demand for a denominational paper. It is started, with but little capital behind it, and a meagre editorial force. It manages to live along from year to year, although unable to render any real service other than the printing of minor denominational news. That the majority of such ventures are unwise is clear enough, but it is not clear that the situation can be made satisfactory by freezing out the many through the extension of official denominational patronage to a selected few. The denomination will gain in the long run by applying its official energies in other directions and giving to each journalistic aspirant a fair field in which to win the support of individual readers. The ideal denominational paper will cultivate its own field more fully than any other paper can, will keep its readers in touch with the main currents of religious life, will aim to keep abreast of all sincere efforts for the betterment of mankind, and will do what it can towards the intelligent editorial discussion of matters of the day from its own point of view. A paper satisfactorily meeting these requirements will secure support without the hampering aid of ecclesiastical backing.

Tennyson's airy navies and Byron's engines to carry man to the moon are brought distinctly nearer by the piling up every day of news about fresh feats in aeroplaning. What has been called the "patient prudence" of the Wright brothers seems now certain to reap its reward in the near future, by their meeting the terms of their contract with the War Department. The attempted cross-Channel flight of Hubert Latham on Monday was sensational both in conception and result, though success was not attained. Doubtless, it will be soon. Meanwhile, how thoroughly experimental and uncertain the art of human flight yet remains, may be seen in the futility of expert comments before the event. The London *Times* had, ten days ago, an article by a skilled engineer on the projected air-crossing from Calais to Dover by M. Latham, in which the gravest danger was argued if the aeroplane should fall into the sea. Said the writer:

> As it would have been travelling at something like forty miles an hour, even after gliding down from an altitude of 300 feet, the speed of the apparatus on touching the water would not be less than twenty-five miles an hour. The whole machine, with the pilot, weighs about half a ton. Imagine the impact and the effect it would have on the wings, on which, however, M. Latham counts to keep the whole apparatus afloat. They are, it is true, air-chambers a foot deep at the base and tapering to the extremities. But would not the canvas be torn to shreds, even if the whole wings were not wrenched off the machine? The aviator's position would be perilous in the extreme.

Yet, in fact, he was found riding at ease and smoking a cigarette!

Lord Lansdowne gave last Friday the first official intimation that the House

of Lords might throw out the Finance Bill. His threat was veiled, but was nevertheless unmistakable. He said that it would be preposterous to suppose that the Lords could be compelled to swallow the Finance Bill whole. This implies the right of amendment, but, in practice, the Lords have no such right. The reason is that the Commons have long regarded any such amendment as tantamount to rejection. This was clearly laid down, in 1897, as the constitutional practice, by a Tory Lord Chancellor, Lord Halsbury. If, for example, the Lords should now strike out the taxes on the increment in land values, it would be tantamount to throwing out the whole bill. So there is no room for indirection. The Lords must either swallow the bill, or spew it out entire. Their right to do the latter is undoubted, but the grave public and political inexpediency of their doing so was described in weighty language by Lord Salisbury in 1894, when another contentious finance bill of the Liberals was before the upper Chamber. Lord Salisbury said:

> I draw a very strong distinction, as strong as it is possible to draw, between the legal powers of this House and the House of Commons, and the practice which considerations of obvious convenience in the interest of the public welfare may induce the two Houses to adopt. It is perfectly obvious that this House in point of fact has not for many years past interfered by amendment with the finance of the year. The reason why this House cannot do so is that it has not the power of changing the executive government; and to reject a finance bill and leave the same executive government in its place means to create a deadlock from which there is no escape.

Now that Mohammed Ali, King of Kings, is sent flying from his throne at Teheran, the world of Islam has witnessed in the course of less than a year the deposition of the sovereign head of every independent Moslem state. Turkey, Persia, and Morocco will each have its living ex-Sultan, and Morocco may have two; for Mulai Hafid seems to be in danger of following his brother, Abd el Aziz, into the obscurity of private life. After this it will not be so easy to speak of the dread power which hedges in every Mohammedan ruler as the shadow of God upon earth. After this it will be more difficult to speak of the Mohammedan creed as a religion of stagnation; and, in a wider aspect still, the supposed historical opposition between religion and political liberty will appear less evident than ever. For it is to be noted that in Turkey, the representatives of Islam, while divided into two camps, have on the whole worked harder for progress than against it. In Persia, the rôle of the priesthood would seem to have been wholly admirable. The doctors of the law were among the pioneers of the liberal movement, and at a critical moment they acted boldly by proclaiming the excommunication of the Shah. In Morocco, it is true, Mulai Hafid was believed to have won against his brother as the avowed champion of orthodoxy. But the speed with which Hafid's authority has crumbled away shows that in reality political motives of some sort must have been predominant even in Morocco.

Great Britain's attitude towards the Constitutional cause in Persia is scarcely receiving fair consideration. England's treaty with Russia for the parcelling out of Persia into spheres of influence has given rise to the charge, or at least the suspicion, that British methods in the Shah's Empire must henceforth be Russian methods, and consequently that British hostility to the Parliamentary régime must be presumed. Now, in the first place, even Russia in the present affair does not stand patently condemned. With Great Britain she has publicly urged upon the Shah the necessity of restoring the Constitution and reconvening Parliament. Her occupation of Tabriz has done the Liberal cause more good than harm. Had the Shah's troops entered that city, the prestige of the Constitutional party might have been submerged in a tide of massacre and destruction. Russian intervention saved the Nationalist leaders and enabled them to march on Teheran with what results we know. As for Great Britain, it was under her encouragement that the Persian Liberal movement won its first victories. The argument that a Constitutionalized Persia would endanger the British position in India is scarcely valid. The Hindus already know what they want, and Great Britain knows what she must concede and can concede with safety. Continuous civil war in Persia, such as the Shah's ascendency would bring, would probably exercise a more disturbing influence on the neighboring tribes in India than could any Persian Parliament.

If Abdul Hamid refuses to withdraw the millions which his bankers would like to get rid of, it is not because he has read the Contributing Editor's article in the *Outlook* on the disadvantages of great wealth. The late Sultan, on the other hand, is firmly convinced of the merit that lies in cofferfuls of treasure, provided it cannot be taken away from him all at one time. The Turkish nation, during these last few months, has learned to look upon Abdul Hamid as one of its most important sources of revenue. He has been signing checks with a freedom of gesture that many a Pittsburgh millionaire on Broadway might envy. Presumably, the Turkish Department of the Interior is still at work tapping the walls at Yildiz in search of hidden wealth. If a secret chamber yields satisfactory results, well and good. If the chamber turns out empty, word is passed on to Salonica, and the ex-Sultan signs a check for a fair equivalent.

How the times move forward in Asia comes to us with something of a shock when we find the Chinese press discussing the empire's need of factory legislation. Shanghai and Pittsburgh, Nankin and Sheffield here meet on the basis of a common want. The foreign press in China, while naturally friendly to the general cause of reform, is inclined to be skeptical of sudden and drastic change. It is all the more gratifying in the present case to come across so enlightened a view as that to which the Shanghai *Mercury* gives expression: "Human life is abundant in China by reason of the very fertility of the soil and the fecundity of the people, but abundant life must not be held to justify the cheapening of life; and it should not be possible for China to produce millionaires as some other countries do, at the expense of literal flesh and blood." This is bold thinking for a predominantly commercial community like Shanghai, in which supposedly the principle of unrestrained competition would rule. And if it be argued that China must go through the same process as the West, if she would attain the civilization of the West, our commentator takes sharp issue. "It is," he says, "to save China from such difficulties as other countries have had to face that we urge the necessity of immediate action in this matter. Prevention is better, and cheaper, than cure."

PERSONALITY IN POLITICS.

The extraordinary and approving response which President Taft's frank and clear statement has evoked, is one tribute more to the power of strong personality. We admit it everywhere else, but are reluctant to allow it in politics. In life, in literature, there is no magic charm like that of personality, but politicians are afraid of it in their business. Of this they sedulously cultivate the idea that it must be conducted by committees and parties, never by individualities. Everything is collective, nothing personal. Intrigue and subterranean management are the prime forces; and the old practitioners of the art are always aghast when some man of native vigor comes forward with open methods and direct appeals. It has been so with Gov. Hughes; it bids fair to be so with President Taft.

And what increases the bewilderment and the pain of the politicians is the joyful way in which the people rise to such men when they show themselves. This is not merely the jealousy of time-servers when they see servants of the public rapidly advanced over their heads to honors toward which they themselves vainly aspire. The old hands at the political business are really puzzled at the phenomenon. Trained to depend upon far other qualities than courage and downright convictions, they are always at a loss when they encounter a man dowered with such gifts, and are absolutely taken aback when he proceeds to his goal amid popular acclaim. This only shows that Burke's reproach was just, when he said that politicians did not know their own tools. The greatest power they have to deal with is personality; but, despite repeated demonstrations of that truth, they remain as men unaware of it. They are continually astounded, and look at each other in a kind of wild surmise, whenever

> —the spirit of a single mind
> Makes that of multitudes take one direction
> As roll the waters to the breathing wind.

In the puzzlement which the plodding dealers in routine politics feel in the presence of a public man of large and elemental force, they are sometimes led to curious confessions and fears. The exhibition of power they cannot deny, but its effects they profess to dread. Thus Senator Raines has lately unbosomed himself about the perils that threaten the people of the State of New York, because of their great "friendliness" to Gov. Hughes. In their enthusiastic admiration of the man, they are in danger of adopting his policies; and as those policies go counter to some of the cherished plans of Senator Raines, they are, *ipso facto*, bad for the commonwealth. In the same way one of our daily papers has been gravely arguing with the people to restrain them from the folly of blindly following Gov. Hughes. They do not in the least understand what the direct primary means, but are working for it and voting for it with eagerness, simply on his say-so. This is a dangerous form of hero-worship. The next thing will be for the Governor to advocate abolishing the Legislature, and then we shall have the multitude making haste to agree, purely out of their convinced feeling that the Governor is absolutely honest and disinterested. A sober citizenship ought not so to be carried off its head by an outstanding personality.

Well, all these timid folk who are so terrified by the advent of a real man, need not be driven to entire despair. The world has not, as they seem to fear, gone daft over personality in politics. It has not taken up with Carlyle's theory of rule by the strong man. The strongest man has to act under certain limitations. His leadership is qualified by a thousand conditions which he cannot control. He, like the rest of us, is caught in the common predicament; and when his fellow-citizens give him their confidence and their suffrages, it is only because he has fathomed their difficulties, interpreted their desires, and shown them a way out of the coil. Senator Root correctly diagnosed what he called "the very great popularity" of Gov. Hughes, when he said that the people had grown impatient of narrow and selfish partisan control, and that the Governor was trying to help them throw off its yoke. Similarly, to-day, the mighty volume of support which is flowing to President Taft, is due to the fact that he has understood and expressed the wishes of the great mass of his countrymen. He is not attempting to impose his individual will upon Congress. It is merely that he has sensed the desire of a great people not any longer to be held in the clutch of special interests, and has uttered a feeling which is universally recognized as not merely his own, but that of the American citizenship whose direct representative he is. Suppose that the President had thrown himself brutally on the side of the tariff extortioners, what would his personality have counted for then? As it is, he is strong because he is on the side of justice and decency.

Yet the most righteous causes languish till a man is found to embody them. People will stand conscientiously for a principle, yet they best fight for it when it takes on form in a human personality. In times of political crisis we feel the truth of this. Then the cry is always for a leader. So true is it that, in politics, too, a man is more precious than the golden wedge of Ophir.

JUDICIAL REVIEW.

The power of courts of law to annul statutes on the ground of their alleged incompatibility with organic law is to-day the chief difference between our judicial system and Great Britain's. Conservative statesmen in England have of late frequently cast covetous glances at this feature of our polity. Notable among such expressions was a recent guarded but emphatic utterance of the Lord Chief Justice in criticism of certain acts of Parliament which withdraw executive actions from the cognizance of the courts, and which make the findings of administrative boards final. The London *Times* echoes his forebodings and opines that "there may come a time when we shall have a *droit administratif* according to which the Treasury, the Local Government Board, and one or two other departments will have powers to do as they please without review or control and, like the Sovereign, will be able to do no wrong." In curious contrast to this implied laudation of our practice of the judicial veto is the dissatisfaction recently manifested at home over this very feature of our system. The popular agitation against "government by injunction" is a recent phase of this irritation. Nor is it wholly confined to those interested in the powers of labor organizations. Mr. W. F. Dodd, in a recent article in the *Political Science Quarterly*, avers that "the courts have now become practically legislative organs with an absolute power of veto upon statutory legislation which they regard as inexpedient."

The historical origin of this divergence in the powers exercised by courts

here and in England has been traced by an American scholar, Mr. Charles H. McIlwain. He has abundantly established the fact that originally the notion of any clear-cut distinction between legislation and adjudication was unknown. Indeed, the very idea of *making* law was foreign to the early English jurisprudence. There prevailed everywhere the dominant idea of a constituent, organic, and customary law which it was the business of the High Court of Parliament as well as the other courts of the realm to *discover* or *declare*, and to apply to individual cases. Thus the name of the supreme legislature in Great Britain, as well as the judicial functions of the House of Lords, embalms what was at one time the very essence of Parliament's activity. When the sovereign originally called a meeting of his Parliament, writs were issued to the judges of the courts to attend as a matter of course. Puzzling cases were habitually referred by the regular judges to the supreme court of Parliament, in much the same course as is followed by our system of appeals to higher tribunals, but at the instance of the judges rather than of the suitors. Causes could be instituted also in the High Court of Parliament upon petition; action upon such petitions rather than by bill being the normal procedure in early days. Even more remarkable is the fact that the final drafting of statutes was often left to the regular judges when the substance of the matter had been determined by the full Parliamentary conclave, which would adjourn and allow the judges of the realm to issue the act.

It is quite certain, therefore, that nothing could have been more repugnant to the jurisprudence of even Tudor times than Blackstone's theory of Parliamentary omnipotence—that Parliament can do anything which is not naturally impossible. Down into the times of Queen Anne there persisted the belief that English courts might virtually annul acts of the legislature which contravened essential principles of Magna-Charta or other parts of the constituent law of the realm. Instances of such action by English judges are neither few nor unimportant. This conception of a dominant organic law of higher authority than mere statutes the American colonists took with them to the new world; enshrined in Montesquieu's concepts of the division of powers, it appears in our Federal and State Constitutions.

The triumph of the doctrine of parliamentary sovereignty in England was the outcome of the political struggle against Divine Right, against a personal sovereign *legibus solutus*. No less trenchant a weapon was needed to beat down the pretensions of royal prerogative. But, despite its serviceability in the struggle for constitutional freedom, the subordination of the executive and the courts to Parliament has proved more than once a menace to the real safety and prosperity of the United Kingdoms.

Of course, the most striking instance is seen in the American colonists' successful struggle against Parliament's pretensions to power in this continent. Since that time, the doctrine of parliamentary omnipotence has been but sparingly applied in any of the self-governing colonies of England. But far-seeing statesmen who have at heart the creation of a real empire, have more than once bemoaned a theory of parliamentary sovereignty which works only when left in quiescence. Frederick Scott Oliver complains:

> There is no sovereignty. Everything hangs on sentiment, influence, and management. In the Three Kingdoms, sovereignty so far has not been impaired: but outside these islands, it is a very different matter. . . . The true meaning of the situation is no less painful than it is plain. The most powerful member of a loose confederacy is content to defend her fellow-members from foreign attack for so long as they are willing to acquiesce in her policy. . . . Even with fine weather, it is only a miracle that maintains it, and under rain or storm, there must be a shifting of the balance that can have no issue, but disintegration.

These instances of the results of a concentration of powers in the hands of the Legislature may encourage us in those desponding moments when we lament the way in which the separation, or rather the isolation, of departments of government under our system seems often to scatter responsibility and to impede vigorous, straightforward policy. But, if our plan of judicial review, however far it may disappoint us in individual cases, corresponds to an essential element of the body politic, an essential part of the organic character—the conscience or the memory as opposed to the irresponsible will—we may congratulate ourselves upon having a brake upon inconsiderate legislation.

A ROMANTIC SURVIVAL.

The death of Gen. de Galliffet has put the final seal to a modern D'Artagnan, in the imagination of France. He seems to have possessed to the full those qualities of irony, form, joy, courtesy, and courage, which have been the inalienable heritage of the hero of the Gallic strain. He had as great an *élan* as Hotspur and was as brave. It is not recorded that he liked to kill before breakfast. But his joy in a well-done deed of the heroic type was a beautiful thing to contemplate.

How he gayly interrupted the monotony of garrison life by jumping on horseback from a bridge into the Saône; how, when a captain in the Crimean war, he crossed the Russian lines gallantly to keep a rendezvous with a lady; how, in Mexico, his abdomen torn open by a bullet, he continued, with a fine gesture, to give orders of battle; how, under the walls of Sedan, he did unbelievable deeds—such are a few of the tales that are told of this modern Roland.

Like Paul Jones, De Galliffet believed that "grape-shot sometimes has its uses in the struggle for the rights of man." He played a stern and leading part in the violent suppression of the Commune. When blamed for this by the radicals, he replied: "Let them talk. I would rather be taken for a great murderer than for a petty assassin." Even the radical enthusiast, if he could see the difference between the accidental and the eternal, would recognize in De Galliffet a spiritual brother. For the romantic hero and the dreamer of dreams along political or social lines are alike in this: they both love to engage in battle with the most powerful forces they can find. De Galliffet's romance seems to have extended even to the immaterial world, as all romance really does, for it is said of him that he always asserted his opinions with the vehemence of youth, and that he selected, with a kind of ironical joy, the side which had the greatest opposition.

In a certain sense, De Galliffet was a survival. He was a true "romantic," and, to the extent that romance is dead, De Galliffet and his kind belong to the past. *Le Figaro* says of him: "This fine and great soldier will remain one of the most strikingly original of this epoch, with which he forms a most remarkable contrast. At a time when everything is calculation and selfishness, he re-

mains an excellent example of disinterestedness, energy, and rashness. His courage had in it something prodigious. He might have said, with the poet: 'The more useless it is, the more beautiful.' "

Certainly, in this day of realism in literature, of business methods in politics, of a polite condescension and secret contempt for poetry, of pragmatism in philosophy, of the tremendous insistence everywhere and in every department of life on what is practical, the gaunt figure of this modern D'Artagnan comes to us as something outworn, indeed: the deepest point of our sympathy can go no further than envisaging him as a sort of Don Quixote: where the disinterested and romantic is concerned, we insist on a touch of the ridiculous.

And yet this quality of the romantic and the so-called unreal always appeals to our imagination; it is still true that many of our novels and plays undertake the most meretricious "reproductions" of old heroic periods, with all their gorgeousness of decoration and highfaluting sentiment and their deeds in high-relief. We, to-day, have a genius for the prosaic, for low relief, for hard, careful analysis, for humility of vision, for an unsympathetic re-casting of many warmly-felt ideals. But that we love, and shall always love, the truly romantic is as inevitable as that there shall always be beautiful maidens and men who appreciate them, and generous souls who give themselves, through force of idealistic temperament, to what is unpractical.

It is probable that when we get familiar with our new interests, a fresh romance, so far as material and form are concerned, will be born. When we "move around easily" in our enlarged world, we shall see its modern beauty and gladly sacrifice to it, with new individual and social gestures, with a new conception of *noblesse oblige;* but with the same old disinterestedness, with the same old gayety of heart, with the same worship of the beautiful, with the same chivalry for the weak, with the same joy in self-sacrifice, and the same æsthetic need of clothing our virtue in striking external forms.

The order in which Shakespeare's plays appeared is suggestive as to the normal development of the sense of romance. His early dramas are full of youthful poetry and a love for what is heroic and striking, full of pageantry. Here his romance is, relatively speaking, of the thoughtless and historical kind. Then come the plays of his middle period, when his imagination played over the terrible fate of mankind—the great tragedies. This is his period of realism and of gloom, of social seriousness. But there is a third period, when, in plays like "The Tempest," he returns to pure romance, but a romance this time which is the inner, unseen essence of reality. Perhaps we love romance, in the last analysis, just because it represents the most ultimate reality. And so, when De Galliffet is stripped of all his historical accidents, he remains a figure sympathetic to all, whatever our personal or class interests may be.

THE TRAVEL CURE FOR OLD AGE.

Long before Metchnikoff had diagnosed old age as a disease, the epigrammatists had labelled it as a bad habit. But modest science, as usual, gave more hope than arrogant wit. From our diseases, hygiene and medication may conceivably relieve us, whereas our habits are too often our masters and decline to be exorcised. One may acquire a liking for sour milk, with its beneficent microbes, more easily than one may straighten shoulders once rounded. Happily, the remedy for both the malady and the habit of old age has been discovered. You have only to take an Atlantic liner, or halt in any of the tourist caravansaries from London to Assuan, to see throngs of happy patients complacently taking the travel treatment. Before it old age has withdrawn, and takes its last stand among the sedentary, the unenterprising, and the poor.

One need only observe the gusto of these persons in years—not old persons, mark you—to feel that the enemy has been foiled. It is they who follow cheerful lines of fad and foible, seek unstaled impressions off the beaten track, turn the rubs of the road into adventure or pleasantry, face undauntedly the changing commerce of the inevitable *table d'hôte.* Indeed, it sometimes seems as if the very young or the very old had come to be the only true travellers. While modern means of transportation have reduced travel to a dull system, excluding the unforeseen, isolating the stranger from the people he professedly comes to observe, the young and the old still retain the fine sentimental tradition of the road. Where everything is expansive sensibility, the day's work one long gorgeous discovery, there naturally can be no *ennui,* and that is the condition of the young person when unspoiled. Equally the mild, knowing, and measured expectancy of old age makes for good travelling qualities.

Perhaps the chief merit of travel as a prophylactic is that it keeps alive or renovates failing capacities for companionship. Whatever may be the charms of our American life, the provision for a comfortably serene old age is not one of them. Between those who strive and those who have ceased striving an unnatural gulf is established. Young America hardly has time to parley beyond the moment's need with old America. With the disappearance of caps and stocks it has become more difficult for old people to seem venerable. Instead they struggle to keep young, thus depriving themselves of a dignity and society of a grace. They tend to settle into hopeless ruts among themselves—story-telling, bridge, golf in the limbo beneath the handicap classes. Households, unless we are mistaken, have an increasing tendency to break up into smaller groups, leaving the older members stranded in a rather mournful independence. At any rate, one rarely sees in the city those patriarchal families in which grandparents, aunts, uncles, and aged cousins could easily have cast a majority vote.

Now, travel is the great compensation for the lack of an old-style nest. One has only to follow the preferred isotherms to see contented old age. Indeed, this modern substitute for slippered ease at home has certain obvious advantages. Minor infirmities that loom formidably large at home vanish before constant diversion of the mind. Timorous or anti-social moods are put to flight by the pleasures and necessities of the route. Moreover, a trained judgment and matured humor—the most precious attributes of old age—are kept sharp by daily attrition upon the most various material. What strikes one most in the many aged acquaintances one makes in travel is their indefatigable spirits and unblunted capacity for friendliness.

Modern methods of locomotion distinctly play into the hands of the old. Whatever of romance has vanished with the postchaise and diligence they can very well spare. To-day, they may travel

without peril of exposure and privation. Given moderate means, they can secure en route all reasonable comfort and safety. In the truest sense, the world is at their disposal, for they command that most precious thing, time, and they move without the perturbing energies of younger years. It was a venerable—not an old—lady, just entering the eighties, who, planning a trip to the edge of the African desert, was told that she surely would be buried there. Her retort was that she must be buried somewhere. As a matter of fact, she recovered from a most serious African fever in time to pass through the Kingston earthquake unterrified if not unscathed, and since then she has visited much of the fairest scenery about the Mediterranean.

We have no desire to weigh the relative advantages of old age at the fireside and on train or ship. The new mode is possibly better for the peripatetic elderly person than it is for our society at large. With old age assiduously seeking novelty, what is to become of our traditions? Those of us who are too old or too young to travel may well consider the advisability of inducing a certain number of our most impressive old people to stay at home for the sake of posterity. But we fear the proverbial answer will be wafted from many a departing liner: "What has posterity ever done for me?"

WESTON AND WALKING.

Mr. Weston has arrived at San Francisco after his walk from New York. His ambition to accomplish this trip in one hundred days, he missed, and is much chagrined; he has even declared his walk "a failure." But the feat is the same whether it took a few days less than a hundred or a few days more. He encountered difficulties which would have proved insuperable to a less indomitable spirit. For over 2,000 miles he was forced to walk along railway tracks, a line of march as galling to the nerves as to the muscles.

Mr. Weston is in his seventy-first year, a time of life often considered the day of slippers and the ingle-nook. With Dr. Eliot, he shares the honor of being a concrete refutation of this idea. That a man with a good constitution should turn sedentary at forty-five is usually no one's fault but his own. Moreover, the sight of Three-score-and-ten taking a jaunt on foot across the continent should carry a helpful lesson to cock-sure Nineteen. Too many young men who have hardly reached their growth look upon fifty as athletically impotent superannuation. The *carpe diem* philosophy is applied altogether too much to athletics, with the not infrequent result that youth burns out muscular resources. To take the proper amount of exercise and at the same time to husband one's physical stamina is the real secret.

This long walk is an effective protest against the present-day craving for speed in locomotion. "Rapid transit" has become almost synonymous with transit of any sort. But we hear the critic remind us with a chuckle that Mr. Weston himself sought speed above all else, that his was a perpetual forced march. True enough, as pedestrians go, he made fast time. But walking of any sort is comparatively slow. Pedestrianism is rather a fine art than a means of locomotion. And the fact that the striding old gentleman could make seventy-five miles a day on a pinch does not impair the moral.

He who uses his legs is thereby enabled to use his eyes. Nature in all moods is the companion of him who walks. A network of sun and shadow, or a maze of muddy pools, lies before his feet. His cheek feels the impact of kindly breezes or harsher rain. The bend in the road lures him onward and fills him with peaceful conjecture. A pleasant comrade at his side seems not amiss to most, though Hazlitt and Stevenson cast their voices against it, declaring that the full flavor of a walking tour is best tasted in solitude. Stevenson better analyzes moods, but Hazlitt is the more lyric. He was among the first of Anglo-Saxon blood to sing the open road. He feels its intoxication. He cries:

> Give me the clear blue sky over my head, and the green turf beneath my feet, a winding road before me, and a three hours' march to dinner—and then to thinking! It is hard if I cannot start some game on these lone heaths. I laugh, I run, I leap, I sing for joy. From the point of yonder rolling cloud, I plunge into my past being, and revel there, as the sun-burnt Indian plunges headlong into the wave that wafts him to his native shore. Then long-forgotten things, like "sunken wrack and sumless treasuries," burst upon my eager sight, and I begin to feel, think, and be myself again.

To be one's self is, after all, the great thing. The dweller within walls is today offered countless chances to see Nature. He may also limber up his muscles by various means. But to combine the two: there is a rare privilege. To hobnob with the outdoor world, to catch new vistas, to stray whither one will across the countryside, to feel an unwonted thrill pulsing along taut sinews, and at the same time, avoiding the stress of competitive sport, to preserve a peaceful mind—this is the guerdon of walking. If Mr. Weston's trip should remind folk of this and should set them to experimenting, the jaunt would have been a public benefaction. The humble mode of walking contains the germ of elemental happiness. It will be well when many, with Thomas Randolph, say:

> Come, spur away,
> I have no patience for a longer stay,
> But must go down,
> And leave the chargeable noise of this great town.
> I will the country see. . . .

RECENT GERMAN FICTION.

When Hermann Bahr published his last novel, "Die Rahl," he sent out with the book an announcement of the programme which he had outlined for his future work in fiction. Inasmuch as humanity continually repeats itself in variations of a few original types, and the heroes of Homer are sitting in some disguise in the Café Monopol, just as the Luegers and Bülows can be found in Sallustius, he intended to present those original characters as they occur in modern Europe in such a way that the individual should be totally merged in the type and the type in the individual. His new book, "Drut" (S. Fischer & Co., Berlin), is a deliberate and successful illustration of this theory. The life of a typical officer of the Austrian army, whose infatuation with a fair adventuress of exotic antecedents ruins his career, is relieved against a background of contemporary Austrian life. There are few social and political problems of timely interest to that country that he does not present under some aspect. With its diplomatic, military, and clerical specimens, the story is a panorama of Austria as it is to-day. The defection of Liberalism, the petty jealousies and vanities of the middle-class, and the secret machinations of the clergy—all these are reflected with convincing vitality. Its balance of humor and pathos, and its undernote of human sympathy, make the book enjoyable reading.

Many of the problem novels that flood the market of Germany may have the same significance, but by a preponderance of matter over manner fail to convey an artistic impression. This is espe-

cially true of the stories concerned with sexual and marriage problems. However needful may be the message of books like Hans von Hoffensthal's "Lori Graff," there is an element in them bound to repel not only the more prudish Anglo-Saxon, but every reader who resents being treated to medical and psychological studies in the guise of fiction. It is even more difficult to fathom the *raison d'être* of a story like Frank Nabl's "Hans Jäckels erstes Liebesjahr," and to explain the popularity which the records and revelations of such a nature are enjoying in Germany. Of quite a different order, though the somewhat bald titles are rather misleading, are "Eine Jungfrau," by Emil Lucka, and "Vaterschaft," by Karl von Perfall, both published by Egon Fleischel & Co. of Berlin. The first story pictures the multifarious interests and activities by which an average modern girl tries to find a substitute for her "natural sphere." The second book, being the story of a young man's devotion to his illegitimate child, bears an ethical message rarely heard in a world still dominated by the Code Napoléon. The spirit of both works is serious and dignified, and the treatment of their themes is free from repulsive features.

Since the publication of tho trilogy in which Georg von Ompteda painted with genuine feeling and true color the slow disintegration of the old nobility and its enforced adaptation to new needs and standards, the author until now has written nothing that merits serious attention. His latest work, however, "Droesigl" (imported by G. E Stechert & Co.), seems to mean a new start, and though the main motive, marriage between old nobility and new wealth, is commonplace, he has succeeded in redeeming the subject through the medium of remarkably lifelike characters and situations. They are admirable types, the two Droesigls, father and son: the father, with his obstinate pride in the work of his head and his hands, satisfied to be the master of his thousands of workingmen, and a captain among captains of industry; the son with the parvenu's ambition for the advantages of rank and culture, and the parvenu's tenacity of purpose. On the other side, there are the scions of aristocracy, impoverished by shiftless and extravagant habits, yet solicitous to maintain the dignity of their title and the traditions of the past.

E. von Keyserlingk's "Beate und Marelle," published in S. Fischer's Bibliothek zeitgenössischer Romane, is one of the best stories of the author, whose novels for their style and their atmosphere alone deserve to be ranked higher than ordinary fiction. He, too, has a social climber in this novel—the fascinating but unscrupulous daughter of the manager of a baronial estate, who, on returning as a famous singer to the scenes of her childhood, is invited to the castle and works havoc among the hearts of the masculine guests. Keyserlingk has a singular gift of investing with individual significance and color the well-worn triangular relation, and the conflict in the hero's soul, when he finds himself placed between two women equally dear to him, is worked out with admirable delicacy and consistency.

A set of characters new in German fiction appears in "Kaspar Krumbholtz," by Herm. Anders Kruger (imported by G. E. Stechert & Co.), for the scene of this story of an orphan's growth is a Moravian mission school. Of an honesty and purity rare even in those surroundings, given to religious musings and doubts, the sensitive reserved nature of the boy becomes to him the source of years of martyrdom. Into the account of his struggles with the ignorance and the narrowness of his well-meaning guardians and tutors there often enters a touch of humor, though never without a note of sympathy; for the author evidently knows well the follies and the foibles of this remote little world, and has a smile of indulgence for the men and women that rule it.

Hermann Stehr's "Drei Nächte" (imported by G. E. Stechert & Co.) is a schoolmaster's tragedy. Stehr's art is deeply rooted in the poverty-stricken soil of Silesia, the same soil that produced "The Weavers." A schoolmaster whose heresies have made him an undesirable colleague, and whose personal idiosyncrasies have isolated him from all intercourse except that of his pupils, is the hero of a story heavy with the weight of the incomprehensible. The occult power of the past over lives of the present gives the book its tone. But with this element of mysticism is coupled a close touch with the realities of life, as in the work of Gerhart Hauptmann, who was one of the first to call attention to Stehr.

Friedrich Huch is a writer who stands apart from the general trend of modern German fiction. There is in his works an imaginative quality that seems to take us back a generation or two. In "Pitt und Fox: Die Lebenswege der Brüder Sintrup" (imported by G. E. Stechert & Co.) he records the evolution of his two heroes as leisurely and intimately as if we were not living in a time of rapid transit and literary overproduction. But his method justifies itself, for from the variety of characters that carry the action the reader constantly reverts to the figures of the heroes. Pitt, the dreamer, hyper-conscious, sensitive, analytical, incapable of pleasure without forethought and equally incapable of shaking off the afterthought, is always engaged in a quest for the indefinite. Fox the poseur, clever, enterprising, sociable, unscrupulous in gratifying his wishes, never losing an opportunity or failing to make his margin, is the man of the moment. Life in the towns where they study and work is a shifting background, animated by bourgeois types which are drawn with great fidelity. The plot is one of many incidents and often comes close to a comedy of errors. Yet the story deserves being classed among the more serious fiction of the season.

Several volumes of short stories commend themselves to the reader. Marie von Ebner-Eschenbach's "Ein Buch, das gern ein Volksbuch werden möchte" (imported by G. E. Stechert & Co.) is a selection of short stories which show the gifted author to great advantage both for her human understanding and her artistic sense. The book contains two of her best tales. That of the district physician whose altruistic consciousness is awakened by the appearance in his community of a visionary reformer has for its background a long forgotten page in the history of Galicia. The other gem in the collection, "Der Vorzugsschüler," anticipated by some years the numerous school tragedies that have since been written in Germany, and have become the vehicle of social criticism and psychological and pedagogical theories.

Georg Engel's "Der verbotene Rausch" (imported by G. E. Stechert & Co.) is full of such rollicking good humor as one rarely meets in the fiction of to-day, yet not without a deeper meaning. Rudolf Stratz indulges in excursions into the unknown in his latest book, "Die zwölfte Stunde" (imported by G. E. Stechert & Co.). Of a very high order are the stories by Rudolf Hans Bartsch, which have been published under the title "Vom sterbenden Rokoko" (imported by G. E. Stechert & Co.). The author, who has so rapidly risen to well-deserved popularity by his "Zwölf aus der Steiermark" and "Die Haindlkinder," gives proof in this book that his art is not limited to the soil that gave birth to him. With true historic instinct he couples delicate poetic feeling and a sense of dramatic values.

A. von Ende.

NEWS FOR BIBLIOPHILES.

An author is seldom an authoritative source for bibliographical information about his own books. When James Russell Lowell edited his works for a final edition, in 1890, he prefixed the following note to "A Fable for Critics":

This *jeu d'esprit* was extemporized, I may fairly say, so rapidly was it written, purely for my own amusement and with no thought of publication. I sent daily instalments of it to a friend in New York, the late Charles F. Briggs. He urged me to let it be printed, and I at last consented to its anonymous publication. The secret was kept till several persons had laid claim to its authorship.

And in a letter to R. W. Gilder, dated February 9, 1887, he says of the poem: "I wrote it (slap-dash, in less than a week, I think) with no notion of publication." The correspondence between Lowell and Briggs, part-

ly published and partly unpublished, shows more accurately the facts as to the writing and publication of the book

On November 13, 1847, Lowell copied off "Emerson," as a specimen, and sent it to Briggs, saying that "about six hundred lines" were ready, "all written with one impulse" and "the work of not a great many hours." This portion was copied out on December 31, and sent to Briggs as a New Year's gift, and instructions were given for its publication. Toward the end of January, 1848, Briggs wrote: "When I send you the first proofs you must send me back some more copy, but don't let it interfere with your review articles nor with anything that will produce you cash or comforts of any kind." On February 1 Lowell had, in addition, "and exclusive of Emerson, etc., about a hundred lines," "chiefly about Willis and Longfellow." On March 26 he was "waiting for pleasanter weather in order to finish" the poem. In that letter he told Briggs: "I hope you will write and give me a spur"; and adds, "I ought not to have sent you any part of it till I had finished it entirely." On May 12 he had "begun upon the 'Fable' again fairly," and was "making some headway." On May 19 he asked Sidney Howard Gay to "tell Briggs I have finished John Neal, Hawthorne, Cooper, myself, and something more, and that there will not be more than twelve hundred lines." Meanwhile, Briggs had written, on April 22: "I cannot make any definite arrangements about publishing the 'Fable' until I know the size of it." And on June 3, "Putnam will publish the 'Fable' as soon as the remainder of it comes to hand, and in very handsome style." The last of the "copy" was sent on August 22. On October 4 Lowell wrote: "I send half the proof to-day—t'other to-morrow."

Although the rhymed title page says: "Set forth in October the 21st day," the book was not published until October 25. Briggs says (under the latter date): "They advertised it Saturday (October 21), but the copies were not obtained until this morning. They are mortified about it, but nobody was to blame, as they say when a steamboat blows up." In the collected edition of the "Poetical Works," Boston, 1857, the date of publication was changed to "October the 31st day." Mr. Scudder gives this as the date of "the first title page," and Mr. Greenslet copies his error.

One line, "A Vocal and Musical Medley," was in some way omitted from the title page of the first edition, spoiling the rhyme if not the sense. Briggs advised Lowell to "wait for the second edition before you send any to your particular friends, for I fear that they will laugh at your New York publishers, for the style in which the books is issued." And, in the same letter: "Craighead is a very good printer; he was too busy to do the 'Fable,' and Putnam gave it to a new, but reputed good, printer, by way of trying him." One thousand copies of the first edition were printed. On November 27 Briggs wrote: "Every copy of the 'Fable' was sold a fortnight ago, and the second edition is now about two-thirds stereotyped."

In the first edition, printed from type, the half-title (with publisher's list on reverse) and title form one signature, two leaves (without mark); "To the Reader," one signature, two leaves (with signature mark "1"); while the text is six signatures of six leaves each (marked "2," "3," "4," "5," "6," and "7") and one signature of a single leaf marked "8."

Several editions were printed from the stereotype plates, which were made after the first thousand copies were disposed of. A "Preliminary Note to the Second Edition," filling six pages, was prepared, but some copies were sent out before it was ready. Copies of the earliest printing consisted of three signatures of twelve leaves each, the last ending on page 72. The next two leaves, pages 73 to 76, form a fourth signature, and the last two leaves, pages 77 to 80, form a fifth. This copy does not contain, and apparently never has contained, the three extra leaves, the "Preliminary Note."

The second printing has also three signatures of twelve leaves each, the last ending on page 72. Then comes a signature of eight leaves, being pages 73 to 80 of text, and four leaves of advertisements (pages 9 to 16 of Putnams' Catalogue). The "Preliminary Note," three leaves, was separately printed and pasted in on the fourth leaf of the first signature. These leaves were, in most copies, pasted on before the book was bound, but Mr. Chamberlain possessed a copy in which the three leaves had evidently been inserted after binding.

In a third form the title leaf is a separate signature, followed by three signatures of twelve leaves each, of which the last ends on page 68. Pages 69 to 80 form a fourth signature of eight leaves. The "Preliminary Note," three leaves, forms part of the first signature. The copy of this form examined has the last line of the imprint "G. P. Putnam, 10 Park Place." The title was not reset, merely this change made in the stereotyped plate. This copy has advertisements dated "June, 1854," bound in at the end. The only signature marks on any of these stereotyped editions are "1" on page [iii] and "2*" on page 33.

Some of the more important typographical differences between the first and later editions are:

The first edition has a half-title, not in later editions.

The later editions have the added line on title, "A Vocal and Musical Medley," not on the title of the first edition.

Later editions have a printer's imprint on verso of the title below the copyright.

The first edition has a waved rule above "To the Reader." No rule in the later editions.

The text is numbered [5] to 78 in the first edition; [7] to 80 in the later editions.

The first edition has a rule below the headline at the top of each page, not in later editions.

Correspondence.

SCHOOLS FOR GIRLS IN SHAKESPEARE'S DAY.

To the Editor of The Nation:

Sir: Of the comments on the question of girls' schools in Elizabethan England that have appeared in the *Nation* (called out by my letter of February 18), and that have been sent to me from correspondents in this country and abroad (in England and Germany), the most noteworthy occurs in a letter from a teacher in Philadelphia, who refers me to the notice of a boarding-school for young ladies in vol. VII of Miss Strickland's "Queens of England" (see also Bohn's edition, vol. IV, pp. 124-126), in the chapter dealing with Anne of Denmark. There we read that in 1617 "her majesty sojourned at Greenwich palace during the King's absence"; and the writer adds:

> The young women of Lady's Hall, a great boarding-school at the neighboring town of Deptford, performed a masquerade for the diversion of her majesty. In the course of the prologue, the Queen was addressed thus:
>
> The lovely crew
> Of Lady's hall, a pure academy,
> Where Modesty doth sway as governess,
> These pretty nimps [nymphs] devoted to your grace
> Present a sport, which they do yearly celebrate
> On Candlemas night with due solemnity
> And great applause.
>
> The piece was entitled "Cupid's Banishment," and in the course of it there was a song: "The Nimps' Song and Joy that Cupid is gone." This seems to have been written from the teachers' point of view rather than that of the pupils.
>
> A young man, Richard Browne, personated Diana in the masque. The scholars brought the Queen gifts of their needlework.

Miss Strickland is surprised that a man should have been called in to personate Diana; but this was not strange in that day, when all female parts on the stage were played by boys or young men. Diana was probably the only part calling for much speech or action. The attendant "nimps" only sang and, perhaps, danced.

Miss Strickland says that this is "the earliest notice of a boarding school to be found among the memorials of English costumes" [customs?]; and that such schools had then "succeeded to the ancient convents where girls were formerly educated."

If this school dated back to the suppression of the convents under Henry VIII, it was in existence when Shakespeare wrote the plays in which schoolgirls are mentioned. Probably there were other schools of the kind; and this one, only three miles from London, would very likely be known to the dramatist. The reference to the needlework and the singing of the pupils is in keeping with what Helena says to Hermia about their schoolday employments.

Miss Strickland, of course, made a very thorough and careful study of the history of the period, and it is curious that she found no earlier mention of schools for girls, and that no other writer, so far as I know, has discovered anything on the subject in historical and other literature. What she gives suffices to prove that such schools existed when Shakespeare wrote; and I hope that my calling attention to the question may lead to further investigation and perhaps to fuller information concerning it.

W. J. Rolfe.

Cambridge, Mass., July 12.

UNCUT LEAVES.

To the Editor of The Nation:

Sir: The recently begun cutting of the *Nation's* leaves, for which the thanks of its readers are due, emboldens me to express my long pent-up indignation against publishers who do not cut the leaves of their books. One can understand the practice in light novels, whose readers care for such fancies. In more serious works it is often very annoying.

Last winter, in Rome, when I was constantly referring to the thirteen volumes

of Gregorovius's History, it was the cause of daily exasperation to have to fumble through its home-cut ragged pages.

I have on my shelf five volumes of the Cambridge Modern History, a book which none but the most hardened devotees of history will read, who surely are above caring for bookbinders' fads. Why have the publishers aggravated the difficulty of the task—in all conscience difficult enough—of mastering this work by leaving the pages uncut?

Will not our publishers use a little discretion and save the reader from the filthiness of home-cut books, and the annoyance in their use? S.

Garden City, N. Y., July 15.

BRUGMANN'S ANNIVERSARY.

To the Editor of The Nation:

Sir: During the coming week will be celebrated the twenty-fifth anniversary of Karl Brugmann's occupancy of the chair of Indogermanische Sprachwissenschaft in the University of Leipzig. Brugmann received his appointment as *ordinarius* June 21, 1884, and entered upon his duties August 26. An intermediate date, falling within the period of the Leipzig University jubilee festivities, has been selected, and at 11 A. M., July 27, in the Indogermanisches Institut, there will be formally presented to Professor Brugmann a *Festschrift* representing sixty contributors, and a *tabula gratulatoria*.

Brugmann's leading position in the field of Indo-European comparative philology is too well known to warrant any recitation here of his achievements. His extraordinary command of a now unwieldy material, his sanity of view and clarity of exposition, are the inspiration, if not the despair, of all who have to deal with problems of historical grammar. His numerous American friends and former pupils will surely desire to be present in spirit on July 27, and join in the congratulations offered him. Carl D. Buck.

University of Chicago, July 17.

SPEAKING THE LINGO.

To the Editor of The Nation:

Sir: The Secretary of State recently published a list of twenty-three promotions in the American consular service which meet with praise as an indication that that service is placed on an "absolutely business basis." Such praise can scarcely seem wholly deserved unless ability to speak and write the language of the country has been made an essential to appointment to a consulship. Let us hope it has.

Towards the end of the last Administration, a gentleman, commanding, I believe, two continental languages, was "promoted" from a neighboring country to an important city in Italy, where, as he says, he does not "speak the lingo," and where, in the absence of an American assistant who does, he must depend upon Italian clerks to translate all documents. I would not imply that the clerks in this instance are not above temptation, but, unfortunately, public corruption, as the recent general elections, the frequent charges against the administration of the earthquake funds, and other scandals abundantly indicate, is not less known in this country than in others, and complications are conceivable which would prove that such a consulate is not upon a "business basis."

No Name.

Tuscany, Italy, July 4, 1909.

Notes.

Houghton Mifflin Co. has secured the American copyright of the "Autobiography of Henry M. Stanley," edited by Lady Stanley. This book, which promises a vivid story, will be published in the autumn.

Alfred Noyes's epic on "Drake," which had the unique honor of appearing serially in *Blackwood's Magazine*, will be brought out next autumn in book form by Frederick A. Stokes Co. This American edition will have a special introduction.

Anatole France is said to have chosen for the subject of his next work "The Fall of the Angels," based on the story of Milton's "Paradise Lost."

John Murray of London will soon issue a book by Richard Edgcumbe, on the closing years of Byron's life, under the title of "The Last Phase." It gives an account of Byron in Greece, and denies the scandalous conclusions of the present Lord Lovelace in the privately printed volume "Astarte."

Friends of the late Dr. Lowell Mason, who have letters from him, or any memorabilia, will confer a favor by communicating with Henry L. Mason, No. 188 Bay State Road, Boston. Mr. Mason is the grandson of Dr. Lowell Mason, whose life he is writing.

We are informed that the library of the late Prof. Simon Newcomb is offered for sale either *en bloc* or in parts. The collection is naturally rich in books on astronomy, mathematics, and physics, and also has a large number of works on economical subjects. A typewritten catalogue of the library had been prepared under Professor Newcomb's personal direction. To any one contemplating purchase of the library this catalogue will be sent on application to the executor of the estate, at No. 1620 P Street, Washington, D. C.

The committee which took up the task of preparing a suitable memorial address to the University of Leipzig at its 500th anniversary has completed its work far enough to send through Prof. Williston Walker a document on three sheets of vellum, printed in illuminated Caxton letters which belong to the period of the establishment of the University. In addition to this memorial a fund of about $350 is being utilized in sending to the library certain back numbers of American scholarly journals for which it made special request to the committee, and also in presenting subscriptions to a number of American scholarly journals. The committee has acknowledged personally to each of the subscribers the receipt of checks and other remittances. If any member of the association cares for a detailed account of the shipments to the library, this can be secured by writing to the secretary, Prof. Charles H. Judd of the University of Chicago.

A smoking room full of English sporting men talking pretty steadily between Liverpool and New York, an intelligent stenographer assisting, might on landing have delivered to the publishers (E. P. Dutton & Co.) the curious colloquial miscellany called by its authors, Messrs. Ralph Nevill and Charles Edward Jerningham, "Piccadilly to Pall Mall." These very wise collaborators know all that a man of the world needs to know about London fashionable gossip, clubs, courtesans, race courses, parks, and galleries of art. They write for the most part with something of the wan poetic melancholy of the elderly clubman—where are the bucks, the dames, the splendid spendthrifts of yesteryear? They lead off with some forty pages of slightly risky aristocratic anecdote, ranging from nameless native noblemen to the Shah of Persia and Li Hung Chang. A Latin jest of George IV, of famous memory, will bear quotation. Forbidden by his physician under peril of serious consequences to attend a certain masquerade ball, that finely romantic sovereign, then Prince of Wales, replied: "Ah, well, *Beati sunt illi qui moriuntur in Domino.*" Like most men of their type, our authors are moralists of distinct views regarding the government of their world. Sir Charles Sedley himself could not have exhibited a more cutting contempt for the morality based on sentiment and Puritanism which is attempting to repress the natural instincts of modern England. The proper authorities in the moral sphere, they contend, are the biologists, and biologists are united, are they not? in declaring the folly of attempting to eradicate our natural bent toward sinning. Mr. Nevill, unaided, contributes an entire chapter in which he urges that the *hetaira* should be not exactly honored and supported at the public expense, but at least looked upon with greater leniency, and not insulted and hounded from one part of the city to another. The authors have also some valuable suggestions which, if acted upon, they think, would tend to attract more people of moderate means to the race track, which, alas, is no longer what it used to be. Passing over many mentionable features of this very helpful work, we must not forget to say that the distinctive stylistic marks are the free use of the "cleft infinitive" and the "floating participle," and that the book may be bought for $3.50 net.

Misguided affection has led John Mayne Colles to publish in pretentious form the "Journal of John Mayne" (John Lane). In the months after the first abdication of Napoleon, when the continent was reopened to English travellers, John Mayne, a youth of twenty-three, made the grand tour and kept the diary now published. He met no persons of importance, and did nothing of special interest; his observations rarely rise above the commonplace. The burden of the journal is occupied with the petty details of what he ate, whether the beds were hard or soft, and how he was continually overcharged by the French and Italians. Such a record, gastronomic, somnolent, and mercenary, may doubtless be interesting to members of the Mayne family, but to others has little that is edifying or amusing.

"Remaking the Mississippi," by John Lathrop Mathews (Houghton Mifflin Co.), is a description in non-technical terms of the engineering experience of the Federal and State governments with the river system of the Mississippi Valley. Their problem was to convert a stream, obstructed by shifting sand-bars and altered by moving banks,

blocked by snags, robbed of its water supply by forest denudation, and interrupted by alternate periods of drought and flood, into a tractable river with water sufficient at all times, and never too much, for navigation, and with its channel free. The problem is not yet solved, but the engineering knowledge acquired through experiment puts its solution within reach. This story of levee building, of revetment, of the Eads jetties, of canalization, with its struggles year after year against the almost human perversity of the Great River, reads like a romance. That all this effort has contributed almost nothing to navigation is attributed by the author to the shortsighted, unsystematic, and irregular appropriations and regulations of the Federal government. He is a strong advocate of the new policy represented by the Inland Waterway Commission, which contemplates the development of our water resources for all purposes simultaneously—water conservation to prevent floods, develop power, and provide irrigation, as well as to aid navigation. A second volume is promised which will discuss in detail future engineering plans and traffic questions. However, on the latter point the author makes his position clear by his contention that the development of railways was not primarily the cause of the destruction of river traffic. Rather, it was due to the interruptions and devastations of the war, during which time transcontinental traffic and ocean commerce from the Eastern seaboard developed rapidly, and to the failure after the war to apply the inventive energy and to show the financial courage necessary to solve the problem of uncertain channels and inefficient terminal service. With a farsighted, consistent policy of water conservation and control, with adequate facilities for cheap and safe handling of commodities, with the separation of freight and passenger traffic, with the introduction into water transportation of the business methods in use in the railways, and with sufficient capital in the hands of the corporations conducting water commerce to weather the first fierce storms of competition, the river system, in the opinion of the author, will be restored to its old-time place. Then, with the opening of the Panama Canal, the Mississippi "will have come into its own."

In a volume of somewhat more than six hundred pages, Dr. Walter F. Adeney has given a history of all eastern Christianity, dealing in the first half of his book with the main body of the Eastern Church down to the fall of Constantinople, in the second with the separate churches from their origins to the present day ("The Greek and Eastern Churches," Chas. Scribner's Sons). The writer's catholic sympathy is evident on every page. While not masking his own opinions, he never adopts a controversial tone, but presents in a fair-minded fashion the merits and defects of each of the warring factions in the church, and of the pagan and Mohammedan foes of the Christian world. Not less noteworthy is the literary skill with which he handles his complex material, never letting minor details distract the reader's attention from the main current of history. In his descriptions of general social condition, such as his chapter on Eastern Monasticism, he is particularly successful. In so vast a subject, the author could not treat every topic with equal competence; mistakes of names, apparently due to careless manuscript and hasty proof-reading, are uncomfortably frequent in his account of the Russian Church. But the book as a whole is a readable and serviceable introduction to a division of ecclesiastical history little known to the ordinary student.

In "The Century of the Child" (Putnams) Ellen Key, who is perhaps Sweden's foremost woman, sums up her life's thought and experience. While both the book and its author have had a great vogue in her native country and in Germany, they are not well known here. The central thought of the book, the *alpha* and *omega* as she herself says, is this:

> Try to leave the child in peace; interfere directly as seldom as possible; keep away all crude and impure impressions; but give all your care and energy to see that personality, life itself, reality in its simplicity, and in its nakedness, shall all be the means of training the child.

Her criticism of the schools and school methods of to-day is unsparing. By mechanical methods, by hypocritical ideas concerning propriety and the social ethics, by ignoring the child's native desires, we suppress the real personality of the child. Instead we should allow nature slowly and quietly to help itself, taking care only that the surrounding conditions help the work of nature. Many of Ellen Key's ideas are familiar to us, and are found in practice in our schools. Many others are most radical. But the whole book breathes a love for the child, a respect for his individuality, and a sincerity that are most attractive. Her point of view in the first chapter, which has the suggestive title, "The Right of the Child to Choose His Parents," is made evident in her statement that whereas it is said that we are obliged to thank our parents for life, frequently parents should ask the children's pardon for their existence. No chapter of the book is more interesting and more timely than "The Unborn Race and Woman's Work." "According to my way of thinking," says Ellen Key, "not woman, but the mother, is the most precious possession of the nation, so precious that society advances its own highest well-being when it protects the function of the mother."

The last volumes of the "Political History of England" (Longmans) are appearing at much longer intervals than the first. I. S. Leadam's (vol. IX, 1702-1760) deals with a period generally accounted arid by the historian, nor do the limitations of the series and of the writer of this volume in any way serve to remove the impression. Anne and George, Marlborough and his Duchess, the Old and the Young Pretender, Bolingbroke, and Swift and Sacheverell, are all dealt by as the words of the document and the historical conscience demand; and the result is a gallery of lay figures. Mr. Leadam is at his best unfolding the conflicts of Whigs and Tories in Parliament and drawing on the Historical MSS. for material; he is less satisfactory dealing with economic questions, as, for instance, in the matter of the union between England and Scotland; he is quite insufficient when it comes to the atmosphere of his period and its personalities. We shall have occasion to speak of these later volumes at greater length when the work is completed.

"Human Nature in Politics," by Graham Wallas (Houghton Mifflin Co.), is an interesting, suggestive, inconclusive work. It is an outcome of the author's experience in English municipal politics, in which he tested ideals by the facts of life, and was thus led to produce an able and candid examination of the theory and the practice of politics, exhibiting their present want of correspondence and making tentative suggestions of adjustment. "One feels," he says, "that many of the more systematic books on politics by American university professors are useless, just because the writers dealt with abstract men." But on Mr. Wallas's own showing English university professors have not attained greater competency, and the only conclusion to which the work comes seems to be this: Wanted, political theories that will account for political facts. Incidentally the book casts light upon present political tendencies in England. Democracy there seeks concentration of power with the purpose of securing responsibility for results. He remarks that "since 1888 Parliament, in reconstructing the system of English local government, has steadily diminished the number of elections, with the avowed purpose of increasing their efficiency." The book is written in a simple, engaging style, giving ample evidence that together with vision the author has unfailing common sense and humor.

It was noted in these columns some months ago that the Greek government, by royal decree, and as a befitting mark of the centennial of Grecian independence, had determined to publish on an extensive and elaborate scale a Thesaurus of the Greek language from the beginning of its literature to the present day. The father of this great enterprise, Prof. G. N. Chatzidakis of the University of Athens, has just published in the leading popular journal of Greece, the *Panathenaia*, a full programme of what is to be undertaken. The most notable feature in the plan is that a beginning is to be made by the collection of materials for a dictionary of modern Greek. Prof. Karl Krumbacher of the University of Munich, the leading living authority on Byzantine Greek, discusses this whole enterprise learnedly in the *Internationale Wochenschrift* of Berlin, No. 22, suggesting two serious objections to the methods proposed by Chatzidakis. Rather unexpectedly the whole project is meeting with decided opposition among Greek savants themselves, this being voiced especially by the veteran Prof. G. Mistriotis, the most influential member of the teaching corps of the University of Athens, who declares that the project of collecting the "vulgar," "dialectic," and "foreign" material and not confining the work to the classical and literary language is "antinational and a fearful betrayal of the Fatherland." He quotes with approval the criticism of the former Minister Delyannis, who, when on a journey, found several adherents of the "vulgar" Greek collecting such material from the lips of old women; and is amazed that now the government itself is to publish a dictionary of such words. The whole controversy will be recognized at once as a new phase of an old quarrel between the classicists and the non-classicists of modern Greece.

The fourth edition of Part II of Col. A. O. Green's "Practical Arabic Grammar"

(Henry Frowde) differs from the third edition only in some changes in the system of transliteration designed to bring the work into accord with the modern practice. The judiciously arranged exercises, the selections from Arabic authors and newspapers, the English and Arabic letters and manuscripts, the vocabularies, and the comparative table of classical and modern Arabic forms and expressions make this volume an admirable aid to those who are beginning the study of the language.

Young Schiller is a figure still surrounded to many of us by the halo of romance, borrowed from the atmosphere of "Die Räuber." By selecting from the complete correspondence the letters of his youth and editing them separately, Max Hecker has done a meritorious work. "Briefe des jungen Schiller" (imported by G. E. Stechert & Co.) is a more direct and intimate record of the development of his personality than any biography can hope to give. Typical of the high-strung emotionalism of the youth chafing under the discipline of the Karlsschule, are the letters to his friends, especially that epistle to Scharffenstein, full of the fervid sentiment and pathos, which, though undoubtedly genuine at the time, gave to his later writings, whenever it recurred, a slight tinge of insincerity. But the bulk of these letters to his sister Christophine, to his motherly guardian angel Frau von Wolzogen, to his patron Dalberg, to Schröder, Körner, and others is concerned with his plans and hopes, and is haunted with the spectre of poverty. The financial obligations which Schiller had incurred by his flight from the academy and the publication of "Die Räuber" preyed on his mind. Reiterated apology and subterfuge make them truly pathetic reading. The element of humor, however, is not absent. His frequent clamoring for a new supply of writing paper, goose quills, and snuff is rather amusing. The editor has supplied a readable introduction.

So little is really known of the celebrated Jakob M. R. Lenz, the German-Russian friend of Goethe, that the student of German literature cannot fail to welcome the first biography of the poet, a volume of 557 octavo pages from the pen of Dr. M. N. Rosanow, *Privat-docent* in the University of Moscow. Dr. Rosanow has but fulfilled the wish of Goethe that such a *Leben* should be written; although Tieck and others made various efforts to represent the poet of the storm and stress period. By careful examination of the archives at Strasburg, Berlin, and the British Museum, the Russian scholar has been able at last to picture with satisfactory certainty the various episodes of Lenz's career. There are the student days in Königsberg, the study of Shakespeare, as Goethe had undertaken, under the same Alsacian skies, the dramatic experiments contemporaneous with the American Revolution, and, not least interesting, the visit to the court of Weimar in 1776. One hundred solid pages of notes present an astounding commentary on the various chapters; but unfortunately there is no index.

Fichte's "Reden an die deutsche Nation" have been redited by Rudolf Eucken and are published in an attractive volume (imported by G. E. Stechert & Co.). The feature of the book is the illuminating introduction, in which the author defines the importance of Fichte in that critical period of German history, when the nation needed a leader of his philosophical latitude.

A handsome volume in "Die Bücher der Rose" (imported by G. E. Stechert & Co.), is called "Die Droste" and contains letters, stories, and poems by Annette von Droste-Hülshoff, the most gifted poet among German women in the nineteenth century.

Francis Almon Gaskill of the Massachusetts Superior Court died July 16, at the age of sixty-three. He was long a trustee of Worcester Academy and of Brown University. He published one book, "Civic History of Worcester, Mass."

John Goode, last surviving member of the Virginia secession convention, has died at Norfolk. He was the author of "Recollections of a Lifetime," and of a series of articles called "Civilian Chieftains of the Confederacy."

A dispatch from London announces the death of the Rev. George Tyrrell, for many years a member of the Society of Jesus, from which he separated on account of his sympathies with modernism. Father Tyrrell's articles on religious subjects were condemned by the Holy Office, and he was deprived by the Pope, in 1907, of the privilege of administering the sacraments. He wrote largely on the modern movement.

Rosa Nouchette Carey, the English writer of popular novels, died July 19. Her first work, "Nellie's Memories," was published in 1868; her last, "The Angel of Forgiveness," in 1907. In the intervening years she wrote a large number of stories which for the most part are now forgotten.

Dr. Henry Cazalis has died at Geneva, at the age of sixty-nine. He wrote books on many subjects, and used other pen names besides that under which he was best known, "Jean Lahor." His most popular volumes of verse are: "Les Illusions," "Cantique des Cantiques," and "Les Quatrains d'Al-Gazali." Other books are "Étude sur Henry Regnault," "La Gloire du néant," "William Morris et le mouvement nouveau de l'art décoratif," "La Pathogénie de l'arthritisme," and "Les Risques pathologiques du mariage."

FRANK SANBORN'S REMINISCENCES.

Recollections of Seventy Years. By F. B. Sanborn of Concord. Boston: Richard G. Badger. 2 vols. $5 net.

Mr. Sanborn's memoirs will surprise those of his readers who, knowing him only by the caustic journalism of his later years, suppose him to be wholly devoted to that sort of self-expression. These two volumes cover, roughly, his life down to the civil war, although in several cases they reach a later date. There is, for instance, a chapter on the Concord School of Philosophy. On the whole, we think Mr. Sanborn well-advised in stopping where he did: because the real interest of his recollections lies not so much in his own achievements as in his contact with one tremendous historic episode and in his intimacy with two or three great American writers. The work of his later life in various practical reforms may have been useful, but it could not well furnish the staple of an important autobiography. It is when he is Boswellizing about Concord that we listen to him most gladly.

For its intrinsic importance, however, the John Brown story, which fills nearly all of the first volume, outranks the other topics. Mr. Sanborn has written and spoken so often about Brown that one might wonder that he had anything more to say. In fact, however, he gives here an account of the martyr-fanatic from the opening of the Kansas campaign, furnishing a good many unpublished letters, and inserting others that have been scattered through various publications. The reader will not get from him a final, symmetrical chronicle—for Mr. Sanborn's mind is too miscellaneous to produce a finished work of art—but he will learn many indispensable facts. Considering the acrimony with which every detail has been fought over hitherto, Mr. Sanborn's uncontroversial spirit is as refreshing as it is unexpected. He has exchanged gall for rosewater. The result is greatly to John Brown's advantage. So far as we see him in these pages, he might be one of Cromwell's men in zeal and in his conviction that he was doing the Lord's work; as simple as a child in most of his dealings, as unshaken as Abdiel in the face of danger and death. We wish, however, that Mr. Sanborn had been, in some cases, more explicit. The Potawotamie execution, for example, he refers to several times, but beyond saying that whatever Brown did he unquestionably believed he was right in doing, Mr. Sanborn hardly supplies us the necessary facts for forming our own opinion. Servants of the Lord, as the Old Testament historians abundantly teach us, are not always free from guile; and we should like to know how far John Brown resembled, in this respect, his Hebrew models.

But Mr. Sanborn may reasonably rejoin that he is writing his own recollections, which deal with Brown only as he was personally concerned in Brown's affairs. The vividness of Mr. Sanborn's impressions, and the clearness with which he describes them are as valuable, in their way, as the documents. We have real bits of the anti-slavery sentiment which, in the late fifties, was becoming a religion to many earnest souls in the North. Nothing is more characteristic than the matter-of-fact tone in which Mr. Sanborn tells how he and his friends engaged in treasonable plots against the government; and certainly there have been few stranger meetings in America than that at the Revere House, Boston, at which Sanborn, the young schoolmaster; Theodore Parker, the eloquent minister; Dr. S. G. Howe; G. M. Stearns, the Medford philanthropist, and Gerrit Smith discussed whether

or not to give John Brown the signal to go ahead. When such men turn conspirators, either a revolution or the madhouse is near.

In the second volume Mr. Sanborn devotes himself to Concord, prefacing his account of its authors and customs with reminiscences of his first love affair and of his formative years at Exeter and at Harvard. We should be glad to have a more consecutive story, but that is beyond his purpose. He gives us instead a multitude of miscellaneous facts and impressions, some vital, others trivial, nearly all interesting. Considering the number of times that he has raked and reraked this field, it is surprising that he has still some fresh gleanings to offer. Read these chapters, and you will see, better perhaps than anywhere else, the daily humdrum of village life in Concord, if that may be called humdrum in which so many queer, and a few remarkable, persons were concerned. Mr. Sanborn says somewhere that he had a passion for knowing men; that he gratified this passion appears on every page. His interest in his fellow-beings is as insatiate as a savant's curiosity. He knows all about the humblest dweller in Concord—be he the butcher, the baker, or the hogreeve—not less than about the celebrities. And he knows equally well what flowers or birds are to be found in the Carlisle woods or on Nashawtuc, by the Assabet, or along the shores of Walden Pond.

He produces the effect of a glorified gossip, or garrulous town-pump. To him no item comes amiss; by him nothing is forgotten. There is a lack of perspective, a temperamental inability to coördinate and to generalize. Mention the name Hosmer, or Bartlett, or Barrett or Buttrick, and he reels off the proper genealogy, with some anecdote of every member of the family whom he mentions. This results in a sort of Pepysian disconnectedness, but it has also the Pepysian charm of real life.

When it comes to the portraits of Concord celebrities, we do not observe that Mr. Sanborn brings much that will cause a revision of the opinions which the well-informed already hold; but we note, with satisfaction, that his former extravagant admiration of Alcott and Thoreau has considerably abated. Thoreau was certainly a striking figure in American literature, but it is plain now to everybody, as it has always been to the judicious, that he does not belong in the same class with Emerson. Even Mr. Sanborn permits us to suspect that Thoreau consciously imitated his master, and he admits that both Thoreau and Ellery Channing were rasped by Emerson's Olympian aloofness. Mr. Sanborn strives, as usual, to make a hero out of Ellery Channing; as a friend's zeal for a friend, it is a pious task. But has friendly piety no allegiance to truth? Is it desirable that a man who shirked every obligation and evaded every duty, who abandoned his children and family, in order to give himself up to a life of perfectly selfish irresponsibility — gormandizing books, playing at verse-making, dallying with ideas—should go down to posterity with implied commendation, as one in whom "imagination and *conscience* were strangely intermixed and transfused"? If friends will write biography, let them remember that the claims of truth transcend even those of friendship.

But we cannot close our notice of these recollections in a tone less genial than that which Mr. Sanborn maintains, almost without a break, to the end. Despite its formlessness, and the rather too frequent resort to scissors and paste, the book is very readable. It will be one of the permanent sources of information for those who study John Brown and the Concord Group. To the student of social manners and customs, it will be scarcely less valuable, because it gives a hundred short-range glimpses of Yankee village life during the second and third quarters of the nineteenth century—that life which is as obsolete to-day as is the Boston of Cotton Mather. It is plain enough that some of the Concord egoists, who thought themselves geniuses, and absolved from the duties common to civilized men, were thinly disguised, or undisguised, cranks. Their verses and their lucubrations, and their diaries filled with anæmic introspection, will impose on nobody to-day. But the true Concord community —with Emerson, and Hawthorne, and with Thoreau, too—can no more lose its significance for Americans than Weimar can for Germans. These recollections by Mr. Sanborn contain much authentic news of it.

We must call particular attention to the illustrations, which include many rare portraits.

CURRENT FICTION.

The White Mice. By Richard Harding Davis. New York: Charles Scribner's Sons.

Mr. Davis here makes another excursion into those fields of South American adventure, or quasi-adventure, which he has hitherto found profitable. "The White Mice" is a fantastic society formed in a convivial moment for the nominal purpose of saving deserving lives. The founding of the order takes place in the Far East, which should be sufficient preparation for the fact that the incidents with which we are concerned occur on our own side of the globe. Not without precedent, an ex-college athlete is the hero. He has pitched at Yale: hence we may expect anything of him in South America. Piquancy is given to the present situation by the fact that, very early in the game, he finds himself at odds with his father, who is at the head of a great American firm of lighthouse builders. The son has been dispatched to Porto Cabello to be kept out of mischief by a minor engineering job, at a few dollars a week.

But it does not really matter how few dollars a week are his portion, how much he may find himself at odds with paternal authority, for he is destined to marry "the richest girl in Venezuela." Her father is immured in an island fortress, and she herself, with her mother and sister, has been banished to an island yet more remote. The ex-Yale pitcher and other "White Mice" take up the liberation of the father at first as an amusement, but presently (the pitcher having become informally acquainted with the girl) as a religion. A native popinjay who wishes to marry her, in part for political reasons, adds to the merriment of the game. There follow plots and counter-plots, veiled messages, lively broils by day, sensational, but for the principal parties safe, encounters by night. An ancient tunnel, sealed, but not guarded, leads to the dungeon where languishes the people's hero—that is, the girl's father. The ex-pitcher finds out about it, penetrates it, blows up the walls of the deadly dungeon, and, after some further adventure (the outcome whereof is a foregone conclusion), rescues the paternal patriot, and escorts him to the arms of his fellow-patriots, who, by a not too odd coincidence, have at that moment triumphed over his foes, and need but him to make their joy complete. When we say that the girl had a hand in this timely rescue (for the enemy would have fatally pinked the prisoner if his rescue had been delayed by a few seconds), we say all that need be said in favor of a rattling "romance" which has, admit the publishers, already gone into numerous editions.

Wallace Rhodes. By Norah Davis. New York: Harper & Bros.

Of standard themes in fiction none wears better than that of a married pair learning to fall in love with each other. The situations are so made to the hand! Those elegant summer breakfasts on terraces, where the bride longs, yet fears, to give her husband a flower! Those drives, with coy, piquant conversation, and burning blushes if the word "wife" or "husband" be uttered! What zest may be lent to the book by its romantic solution of the enigma, "How to be proper though unchaperoned"! It is all familiar ground, and from "The Taming of the Shrew" to Miss Mühlbach it holds its own.

The case of "Wallace Rhodes" of the Mississippi cotton lands has, of course, special features. A father sets himself

deliberately to supplanting his son in order to show him the unworthiness of a reckless coquette. His intention is to draw the girl into an indiscreet unconventionality and thus convince the son, who is engaged to her, that the match must be broken. Finding that he has involved the girl in the public eye more deeply than he intended, the father marries her. He then proceeds to make a deliberate covenant with the son that he will hand over the wife to him at the end of a year, on the trifling condition that Veronica, whom both mistakenly fancy to be still in love with the son, shall wish to be so conveyed. But a simple attitude would naturally be fatal to a complicated story, and so for three hundred pages this father, this son, this wife, and an alternate bride with a scheming aunt play in and out.

The strange thing is that a father capable of such revolting behavior should figure as a knight of potent charm and pure intent. The personality of Veronica is elaborated rather successfully. A girl she is "with nothing but beauty and little ways," and a "polished nullity of manner"; but these are enough to make a deal of mischief. The glances, gazes, eyes, and eyelashes of all the parties concerned constitute a mobilized force by themselves. Their varied manœuvres and metaphysical messages are full of prophecy. In the future the language of eyelashes may replace the more grossly material human speech. Meantime they rather disconcert the plain reader, who comes from these ocular acrobatics with almost a sense of physical eye-strain.

The actual story, entertainingly carried along, is made on a foundation quite too artificial to give the book a firm hold on acceptance. The mind rebels at the evolution of a hero from a blackguard, and at the nauseous mixture of affection and rivalry between father and son.

Red Horse Hill. By Sidney McCall. Boston: Little, Brown & Co.

A melodramatic bent is a good servant but a poor master; and it is deplorable to see a writer of real talent exhibit an increasing lack of restraint in her use of this dangerous ingredient. Regretfully as one observed the retrogression from the poise of "Truth Dexter" to the turgidity of the two Japanese novels that followed, it was to be supposed that the exotic atmosphere of the *mise-en-scène* might be responsible in some degree for the change; but in her present book Mrs. Fenollosa returns to America with no loss of Oriental mannerism. Her purpose in this book is obviously high, and her central situation is a powerful one —the idolized wife of a wealthy millowner, aware of the illegal conditions prevailing in her husband's mill, but intrenched in a comfortable inaction bulwarked with sophistry, discovers in one of the victims of defective machinery her own lost child by a previous marriage. This idea, involving the facts of child labor in Southern factories, would have made a powerful book had it not been weakened by an hysterical riot of individual emotion on the part of the actors in the drama.

The Scottish Staple at Veere. By the late John Davidson and Alexander Gray. New York: Longmans, Green, & Co. $4.50 net.

This is an able and scholarly book on an important phase of an extremely thorny subject—the product of the joint efforts of the late Prof. John Davidson of the University of New Brunswick, who drew the plan of the work and accumulated the bulk of the material, and of Alexander Gray, who has carried the labors of his predecessor to a worthy completion. It falls really into two main divisions: The former, corresponding to Part i and comprising the first 112 pages of the volume, gives an admirable summary of the development of Scottish trade up to the close of the sixteenth century; the second, corresponding to Parts ii and iii, and forming the bulk of the work, describes in detail the history, organization, and development of the Scottish staple in the Netherlands. As "the history of the connection of Scotland with the Low Countries is really the history of Scottish trade," the story of the Staple at Veere, or "Campvere" as the Scots preferred to call it, is a matter of more general interest and importance than would at first sight seem to be the case; the trade of Scotland with England (where incessant warfare rendered continuous commercial dealings impossible), with France, and even with the Hanseatic League and the Scandinavian nations, is, relatively speaking, insignificant.

Scottish commercial relations with the Netherlands date back to the end of the twelfth century, when we find that goods obtained from Scotland were included in a list of merchandise imported by Bruges, and the monks of Melrose, who played a leading part in developing Scottish industry and economic life, and deserve in a sense to be regarded as the pioneers of Scottish trade, received from Count Philip of Flanders a right of free passage through his dominions. In the fourteenth century a Staple, or permanent market for Scottish merchants, with a definite constitution and rules and a fixed relation to the Lower government, was established at Middleburg; thence it was subsequently transferred to Bruges, which remained the chief centre of Scottish trade up to the end of the fifteenth century, when Antwerp, Bergen-op-Zoom, and finally Veere in the island of Walcheren entered the lists as competitors. After a half century of bitter rivalry between these towns for the privilege of harboring it, the Scottish Staple finally went to Veere in 1541, and there it remained, save for one short interval during the Revolt of the Netherlands (1572-8), and another in the reign of Charles II (1668-76), down to the establishment of the Batavian Republic in 1795. By that time, of course, the Staple had outlived its usefulness and had ceased to be of importance; yet the esteem and regard in which the ancient institution was held are clearly indicated by two discussions of the feasibility of its renewal in the Convention of Royal Burghs in 1802 and in 1814, and by the annual mention until 1847 in Oliver & Boyd's almanac, among the officers of the Convention, of the "Conservator at Campvere." It is also interesting to notice that the Scottish Reformed Church at Veere, which was active at the time of the Solemn League and Covenant and sent representatives to attend the meetings of the General Assembly of the Scottish Kirk after its revival in the middle of the seventeenth century, is still, in strict theory, entitled to a continuation of that representation. As recently as 1894 an attempt was made to realize this theory in practice, when a minister appeared at the bar of the Assembly and claimed to be the delegate of "the Kirk Session of the remanent congregation of the Scottish Church at Campvere." The Assembly refused to recognize this claim, but in deference to long-established usage, decided at the same time that the name of the church at Campvere should continue on its roll.

Perhaps the most interesting part of the whole book is that which deals with the organization of the Scottish Staple and its relations to the government of the country. It differed radically from the institution which in England developed under the same name. The latter was favored "in order to concentrate trade with the object of facilitating the collection of customs duties"; it was in fact largely a fiscal device, and "arose naturally from the system whereby the crown derived a large part of its revenue from payments on the export of wool." Its management was thus primarily a matter of royal concern, though the administration was to a large extent left in the hands of the merchants of the staple. But in Scotland "the governing body throughout the history of the staple was the Convention of Royal Burghs"—the most ancient assembly in the land—whose object was primarily "the development of the nation's trade, and the prosperity of the merchant classes." And this divergence in the constitution and object of the staple in the two countries inevitably

led to another fundamental difference. In England the foreign merchant was not excluded, but encouraged, for his advent would rather increase than diminish the revenue of the crown, which was the main object of the system. In the Scottish Staple, on the contrary, the attitude toward the foreign trader was one of rigid exclusion, for the object of the institution was the development of the national commercial prosperity, which the influx of foreigners would inevitably threaten. As an organization for the development of foreign trade a truer analogy to the Scottish Staple is in England to be found in the Company of Merchant Adventurers, which was called into existence solely for the purpose of trade, and not used as a part of the administrative machine; but even here there is danger of carrying the parallel too far, for, though both were primarily commercial organizations, the Merchant Adventurers were merely a private enterprise, whereas the Scottish staple was public and national, an organization of the whole nation for the purpose of foreign trade, with a recognized place in the body politic. To remind us of this essentially national organization of the Scottish Staple, which differentiates it from the Merchant Adventurers in England, we have at Veere the Conservator or representative of the Convention of Royal Burghs, in whom was vested extensive powers of supervision and control. By him were adjudicated cases of dispute arising between Scottish merchants at the staple port. On their life and conduct there he exercised a general power of control. To him was intrusted the execution of the laws of trade, and at the end of each year he had to give an account of his conduct, and answer complaints brought against him.

We should like to dwell at even greater length on this important and interesting book. It affords good evidence that economic history, when properly written, may be quite the reverse of dull; that it can be made, on the contrary, truly fascinating. The Scottish corner of the field is in need of cultivation, and, if the present book is a specimen, will certainly yield good fruit.

The Taverns and Turnpikes of Blandford (1733-1833). By Sumner Gilbert Wood. Published by the author.

Blandford is a little town in western Massachusetts of no great antiquity as New England towns go, and now but a sleepy hill-top village on the edge of the Berkshires. It is some distance from the railway, and its principal visitors are of that transient sort which embodies itself in a toot, a stare, and a cloud of dust; for Blandford is on the official route of the Automobile Club from Springfield to Lenox. There are a few summer cottagers, and here and there an abandoned farmhouse has been restored or "improved." But the little place has seen its best days, and very good days they were, as this book abundantly testifies. For many years it was a chief halting-place on the arduous journey through the Berkshires. Indeed, a tavern provided to break the forty-mile struggle from Springfield to "Housatunnock" was the nucleus of the later settlement. Though the "Great Road to Housatunnock" on which this wayside inn was placed was nothing more than a rough bridle-path, it lay in the main route from Springfield to Albany.

When a few years later the town of Glasgow (now Blandford) was laid out and began to be settled near this strategic point, its function of caravansary was quickly established. Its settlement by families of Scotch-Irish stock perhaps facilitated development into a village of taverns. Blandford suffered as time went on from the peculiar temptation of mine host. But much drinking was a feature of colonial life by no means confined to this particular type of village. Hard-by the church stood the tavern, where the sermon might be comfortably discussed at noon over a stout mug of flip. There, too, a reverend Council of Ordination might be entertained, the town duly voting an appropriation to cover "the strong Drink that the Council drink while they are Hear on our Business" (1749). An old cellar is pointed out where report has it that hundreds of barrels of cider were wont to be "stored in the autumn, and rolled out in the spring and distilled into brandy, which was drunk and sold; and the man who owned that cellar was a preacher of the gospel." But it is easy for us to forget that the temperance movement is less than a century old. Mr. Wood handles this ticklish theme with great good sense and good humor. His antiquarian temper is admirable: he loves every one of his data for its own sake, but keeps it in its place. There is nothing fatuous in his affectionate enthusiasm for the past which he has undertaken to chronicle. If old Blandford was by his admission not infrequently visited by delirium tremens, it was in many other respects "a shining example" among New England towns. The tavern, as a social centre and a promoter of travel was, he holds, more blessing than curse to the community and the country.

As a sign of this, the fact is noted that the aristocracy of the town, not only the selectmen, deacons, overseers, and so on, but the first in social rank, were the inn-keepers. Mr. Wood has some interesting paragraphs on the social system of early New England, and rightly suggests the need of a monograph on that subject. He finds traces in the Blandford records of classes designated by occupation—of yeomen, gentlemen, esquires, and "clarks." The more important of the eighteenth-century innkeepers received the title of gentleman or squire. Mr. Wood gives a number of amusing or edifying anecdotes about these worthies, and divers citations from deeds and court records which yield the savor of the times. None is more quaint than a complaint entered in a warrant as late as 1805 against one Robert Cannon, who is alleged to have made "an Assault upon the body of your Complainant with his fist Gun Club Stone ax Stick Beat wound Bruise Smit Struck him the said John G being in the peace of God and this Commonwealth." The recorded verdict of "not guilty" leads one to reflect with admiration upon the versatile fancy of the complainant in the matter of weapons.

The writer's somewhat detailed description of the turnpikes running, earlier or later, through Blandford, and his account of the part they played in the development of New England, are of equal interest in their way, though it might have been safer to omit some of the topographical detail in a book designed for the general reader. But the very gusto with which he carries us from brook to hilltop, from boulder to swamp, in company with this or that ancient, and, it may be, half-obliterated, path, wins us to his method. The past is a live thing to him, and he goes far toward making it so to his readers. The present book is, he says, a by-product, written as a study toward an elaborate town history, and published "to test my ability to interest the natural constituency to which Blandford history might appeal." The private manner of its publication may have prevented it from reaching that constituency as a whole. We therefore take pleasure in recommending it not only to students of New England history, but to lovers of the past as a sentimental possession. These old taverns which he describes, and many of which he has photographed, are bleak, homely little affairs, differing only by the characteristic end-door from the typical blunt-faced old farmhouse you may see on any New England hill-side. We need to have them, and the life they contained, interpreted for us. It is to be hoped that Mr. Wood (who is Congregational minister at Blandford) is going on with his projected "Homes and Habits of Ancient Blandford."

The Oldest English Epic: Beowulf, Finnsburg, Waldere, Deor, Widsith, and the German Hildebrand. Translated in the Original Metres, with Introductions and Notes, by Francis B. Gummere. New York: The Macmillan Co. $1.10 net.

This unpretentious little volume, pleasing to the eye and light in the hand, we estimate to be the most sig-

nificant of all recent American contributions to the study of Old English. For it demonstrates beyond cavil that this study is pursued here most diligently, not alone as a linguistic discipline, but in equal measure for whatever it may offer of cultural and literary value.

To wide and accurate scholarship—the notes evidence a mastery of the most recent monographs—Professor Gummere joins a facile expression wholly out of the common. This facility is in part innate, in part is doubtless the result of life-long familiarity with our ballad literature. Style and diction are terse, robust, direct, concrete, depictive. Above all, the expression is singularly free from pedantry, the besetting weakness of translators. Occasionally, the reader may be puzzled by a situation or a sentiment quite foreign to modern life; that is a defect which no ingenuity can cure. Most rarely, however, will the reader trip over an uncouth wording. Let us compare like with like. In the *Modern Language Notes* for June of this year, p. 167, Prof. Albert S. Cook translates from the "Christ":

> And from the heights of the air ruin the steadfast stars.
> Then doth the sun, that erewhile shone for the joy of earth's children,
> Turn to the hue of blood, a blot on the face of the sky.

This is Cynewulf modernized. *Ruin* as a verb is bizarre. And the poet did not liken the sun to a "blot in the sky," but merely said with Biblical simplicity: "Then is the sun turned black." By way of contrast, this is Gummere's rendering of "Beowulf," 2249-2260:

> *But* battle-death seized
> And cruel killing my clansmen all,
> Robbed them of life and a liegeman's joys.
> None have I left to lift the sword,
> Or to chase the carven cup of price,
> Beaker bright. My brave are gone.
> *And* the helmet hard, *all* haughty with gold,
> Shall part from its plating. Polishers sleep
> Who could brighten and burnish the battle-mask;
> And those weeds of war that were wont to brave
> Over bicker of shields the bite of steel
> Rust with their bearer.

We have underscored *But*, *And*, *all* as superfluous. They are not in the original, and the insertion of them merely dilutes the verse. In truth, if Professor Gummere has any chronic weakness, it is in the use of the pleonastic introductory *and* and *but*. On the other hand, "haughty with gold," "over bicker of shields," are happy renderings of *hyrsted golde*, *ofer borda gebræc*. And of the passage as a whole every one will admit that the lines read themselves; they impart the swing of the original.

In brief, "The Oldest English Epic" is a performance of which we may all be proud. The ordinary reader, to whom Old English, or Anglo-Saxon, is as Hebrew or Choctaw, may peruse these pages in the comfortable assurance that he is getting as close as he possibly can to the thought and the spirit of our far-distant ancestors. And the professed student will carefully keep the book within reach for friendly stimulation and guidance.

Our criticisms of Professor Gummere's work deal in part with general points, in part with details. Among the general points we would place first his exposition of Old English metre and his modern rendition of it. To assert that the "fourth stressed syllable . . . must not rhyme with the third, or rhyme-giving syllable" (p. 17), is going too far; Sievers (Altgerm. Metrik, 21) is more guarded in his formulation. Further, if there is any one immutable feature of Old English metre, it is this: that the hemistich can never have fewer than four syllables. When we find less, we either assume textual corruption, or restore an earlier dialectic pronunciation, *e. g.*, the Northern dissyllabic *do-an*, in place of the Southern *don*. Yet in more instances than we have attempted to count our translator gives us a three-syllable hemistich, *e. g.*, 442a: "Fain, I ween." To an ear trained to the invariable alternation of stress and "sinking" in the Old English A and B "types," all such aberrations are grievous.

Of other general points where Professor Gummere, as editor, is in error, we remark p. 1, *note* 2: "The seventh [century] . . . with its austerity of morals, its gentleness, its tolerance." This is not our interpretation of Bede; the days of Penda, Oswald, and Oswy, and the bitter Easter controversy, can hardly be described as austere, gentle, or tolerant. Is the assignment of the giant Grendel to the tribe of Cain "superfluous genealogy" (p. 10)? Certainly not according to mediæval notions; nor does the view tally with the editor's own note on page 28. In two places (p. 11 and p. 45, *note* 2) the slang terms "haze," "hazing" are used in a sense unfamiliar to us; we should rather have expected "guying, chaffing, ragging." The Hrunting incident still remains a crux, despite p. 101 *note*. The sword is taken by Beowulf on his quest after Grendel's mother. In the fight with her he dashes it—as useless—to the ground, and nowhere do we read that he picks it up and brings it back. On the contrary, v. 1614 tells us that he took back with him only Grendel's head and the hilt of the old "giant" sword. Occasionally, Professor Gummere has erred through trusting too implicitly to his German authorities instead of verifying their citations. Otherwise, to take a single instance, he would not have said (p. 106 *note*) that "Thrytho is not a likely form of the name." It is a quite possible form. If the editor had not followed Schücking (Engl. Stud. xxxix, 108) but had gone back to *Modern Language Notes*, xviii, 117 (cited by Schücking), he would have found that Thrytho was there demonstrated to be an impossible *nominative;* a different proposition.

Among details open to criticism we note only a few. "Up he bounded" (v. 759) comes perilously near making Beowulf ridiculous; much better is v. 2092: "When I all angrily upright stood." On the other hand, we are glad to learn, from v. 760, that the translator refers the clause: *fingras burston* to Grendel, not to Beowulf. With regard to v. 1467, "drunk with wine," we would remind the translator that the O. E. participle-adjective *druncen* is not necessarily "drunken," but may mean simply "joyous, gay" (see Sievers, *Beitr.* ix, 139). At p. 24, *note* 4, Balder's body is represented as burned ("consumed"). Is it?

Concerning the advisability of incorporating Widsith, "The Singer and His Lay" (pp. 188-200), opinions might differ. The piece is scarcely a poem at all, certainly not a genuine bit of epic. It tells no story, gives no action, but is a mere string of names as dry as the Homeric catalogue of ships. Still, we need not grumble; the names have some interest, and the reader ought to be glad to see how a pre-Norman *précieux* has comported himself. On the other hand, the inclusion of the Hildebrand Lay is above question. Although German, not English, it is born of the same mother, if not of the same father, and its inclusion justifies the editor's assertion that now the reader "has the entire salvage from oldest narrative poetry of the West-Germanic peoples in mass."

Characters and Events of Roman History, from Cæsar to Nero. The Lowell Lectures of 1908. By Guglielmo Ferrero. Translated by Frances Lance Ferrero. New York: G. P. Putnam's Sons. $2.50 net.

One of the points continually pressed by Signor Ferrero is that the men and events receiving most attention in history are neither so good nor so bad as they are apt to be pictured. We may be pardoned, therefore, for saying that the brilliant young Italian's own lectures are neither of such a quality as to prove futile all that patient scholarship has done in the same field before, as some of his newspaper eulogists have announced, nor yet so bad as the trained scholar would be forced to believe, were he dependent upon those same newspaper sources alone. It is unfortunate for the author that he has listened so complacently to an avalanche of praise from incompetent sources. This has brought him to the persuasion that Roman history has been wholly misunderstood down to the present day, that he

himself has found the key to unlock all its secrets, and that the whole is now plain to every one who will but step to the unlocked door and look. From the lecture on "Antony and Cleopatra" we take the following passage:

Two years ago, when I published in the *Revue de Paris* an article in which I demonstrated, by obvious arguments, the incongruities and absurdities of the legend, and tried to retrace through it the half-effaced lines of the truth, everybody was amazed. From one end of Europe to the other, the papers résumé the conclusions of my study as an astounding revelation.

Now, what is the essence of this astounding revelation, that has given European opinion such a shock as Virgil might have illustrated by the simile of a mighty crag toppling from the mountainside and bringing thunderous ruin on the unprepared shepherds and farmers below? In brief, that there was probably less of love and more of calculating ambition at the bottom of Antony's relations with Cleopatra than appears in the literary treatment of the tale as it has come down to us through Plutarch and others. Does Ferrero really suppose that such a possibility has never had serious consideration in any mind but his? And we may add that, in spite of his talk of "obvious arguments," he has adduced no necessarily destructive evidence against any really essential feature of the story. He himself specifically admits that Antony was, toward the end, possessed by a strong personal infatuation for Cleopatra. Evidently, if Europe can be amazed and astounded from end to end so easily as that, the amazing and astounding of Europe are not seriously to be taken into account in the problem of finding the author's place as an historian. Perhaps we ought to set by the side of this passage one or two in which the claims of modesty are recognized:

Two years ago I happened to say to an illustrious historian, a member of the French Academy, who was complimenting me: "But I have not remade Roman history, as many admirers think. On the contrary, it might be said, in a certain sense, that I have only returned to the old way. I have retaken the point of view of Livy."

In one of his lectures, "Wine in Roman History," we are told distinctly that here we are to find exemplified the author's idea of the proper historical treatment of economic phenomena. It was from this lecture, when delivered, that some of the newspapers professed to get the information that Horace, in his references to old Falernian, Massic, Cæcuban, and the rest, was a mere advertising agent for the wine-growers and dealers. Ferrero does not quite say that but he does expatiate at some length on Horace's praises of wine without the slightest reference to his vigorous and oft-repeated counsels against its abuse. One wants some genuine evidence that Horace had any conscious purpose of making a market for wine, and still more that down to the time of Horace's manhood the Romans were so abstemious that wine drinking was not common, but was looked upon with general disfavor as a dangerous extravagance of the careless few. One wants some statistics, too, of the sales of Horace's Odes beyond the Alps before assigning him any considerable influence in the increased demand for Italian wines among the recently conquered Gauls. The economic treatment of history is under heavy obligation to walk with careful foot in such matters.

In a previous review, we were led into believing that Signor Ferrero had abandoned his original intention of carrying his history through the period of the Decline. His opening words, in the last volume to appear, "The publication of the fifth volume, which completes my study of the Greatness and Decline of Rome," seemed definite enough. The lectures before us, however, repeatedly assert that the work is to go on, thus leaving the reader to his own conjecture as to the purpose of the words just quoted. Somewhere between the original Italian text and the press there should have intervened an eye capable of detecting a few annoying blunders, such as requiores for nequiores, Celerus for the Roman name Celer, the Belgi for the Belgæ, Aquilea for Aquileia, Mesia for Mœsia, and Pandalaria, more than once, for Pandataria. All these wrecks of well-known proper names are carried over into the index, with sometimes an extra blow there, as Metullus Celerus, for the at least partly recognizable Metellus Celerus of the text. In a book belonging to the field of scholarship, is not the reader really entitled to scholarly accuracy in such matters?

Hesiod: Poems and Fragments. Done into English prose, with introduction and appendices, by A. W. Mair. New York: Henry Frowde. $1.

Professor Mair's work, wearing what Matthew Arnold's Professor Newman would style "a plausible aspect of moderate antiquity," admirably meets the need for a readable and trustworthy version of the old Bœotian singer of the "Works and Days," to take the place of the bald prose of Bohn and the very blank verse or Popian couplets of Elton. A comparison of Mair and Elton makes the literary fashions of 1820 seem more antiquated than Hesiod himself. If a primitive poet calls the shepherds "bellies only," we wish the translator to say so, instead of addressing them as "ye grosser natures." We prefer "in front of Virtue have the deathless gods set sweat," to

But virtue dwells on high; the gods before
Have plac'd the dew that drops from every pore.

And we can face the plain fact that the maiden "bathed her tender body and anointed her with olive oil," without the interposition of the softening veil of periphrases required by the more delicate sensibilities of our grandfathers:

Around her nightly flows the tepid wave
And shining oils in liquid fragrance lave.

Professor Mair, then, is not afraid of the *mot propre*. His Biblical phrasing preserves the homely, racy quality of the original, and catches the poetical note in the few passages of higher strain. He retains the riddling quaintness of such expressions as "the boneless one" for cuttlefish, the "house-carrier" for snail, the "wise one" for the ant, and the "day-sleeper" for the burglar, which he illustrates from the Hebrew and does not believe to belong to the ritualistic language of Delphi. The earliest idyll in Greek literature, if there can be an idyll without a girl, is thus rendered:

Then let me have the shadow of a rock and Bibline wine, and a milk cake, and milk of goats drained dry, and flesh of a pastured heifer that hath not yet borne a calf, and flesh of firstling kids, with ruddy wine to wash it down withal, while I sit in the shade, heart-satisfied with food, turning my face toward the fresh West Wind, and let me from an unmuddied ever-flowing spring, which floweth away, pour three measures of water and the fourth of wine.

There are few, if any, positive errors. But it would have been well to add explanatory footnotes to some readings or renderings about which difference of opinion is allowable—*e. g.*: "Works," 231, "but with mirth they tend the works that are their care"; 314, "whatever be thy lot"; 374, "aiming at thy barn"; 518, "maketh the old man bent"; 602, "thrall that hath no family"; "Theogony," 269, "swift as time"; 304, "she hath Einarima in her keeping."

The instructive addenda, on The Farmer's Year in Hesiod and Agricultural Instruments, appeal rather to the scholar than to the general reader. The Introduction, besides a life of Hesiod, contains a contrast between the Heroic and the Didactic Epic, and an interesting comparison of Hesiod with the Wisdom-literature of the Hebrews. Professor Mair seems to belong to the dwindling school of interpreters who prefer exact exegesis to ingenious hypothesis or eloquent sentiment. He thinks that Prof. Gilbert Murray's remarks on Hesiod's ox and Hesiod's plowman "have no obvious relation to the facts." And when Professor Murray bids us note that the wife and daughters-in-law of Nestor wail when the bull is struck "exactly you see as the Todas wail," his unfeeling comment is: "Unfortunately, Homer does not say that Nestor's wife and daughters-in-law *wailed*."

Science.

Some eight years ago Dr. J. K. Mitchell wrote for *Harper's Bazar* a few articles designed to help nervous women. These he has now expanded into a little book with the title "Self Help for Nervous Women" (J. B. Lippincott Co.), although, as he points out, the advice is mostly quite as good for nervous men. It may suffice to say that the instruction, which deals largely with the economies of nervous expenditure, is really good and well suited to help those for whom it is intended. In the last few pages Dr. Mitchell firmly opposes the use of hypnotism and expresses entire lack of confidence in the Emmanuel Method, while admitting a certain measure of success at the hands of its originators whom he holds to be exceptionally qualified. He has "grave doubts of the general capacity of clergymen" for making the distinctions that need to be made in the treatment of nervous disorders, or for giving the help that is needed at the time when their advice is usually sought. He points out also that the relation between the clergy and the congregation is in many denominations no longer such as to develop the confidence which would lead a nervous person to her pastor at the time when he might really aid her. Interesting is the comment that cases of nervousness are less frequent among orthodox Jews and strict Roman Catholics than the races involved would lead us to expect, and that the author cannot recall treating a professing Quaker for nervousness.

The history of manufacturing processes does not often receive much attention, and it is a surprise to find a volume with heavy paper, wide margins, and illustrations of all sorts devoted to "The Rise and Progress of the British Explosives Industry" (The Macmillan Co.), prepared by a committee of the Seventeenth International Congress of Applied Chemistry. It hardly fulfils, however, the expectation that its appearance arouses, for more than half the book is occupied with bibliographical and chronological tables and statistics of the governmental and private factories now existing in England, useful for reference, no doubt, but unreadable. The first chapter on the history of gunpowder will be the most attractive to the general reader. It begins with a discussion of the Baconian cipher—not the Shakespeare one, but the anagram in which Friar Bacon concealed his knowledge of the formula of gunpowder. An illuminated Latin MS., dated 1326, is reproduced, showing a bottle-shaped mortar shooting a dart, and in 1380 we have Chaucer's reference to artillery in the "House of Fame":

> As swift as pelet out of gunne
> When fyr is in the poudré runne.

"The Cell as the Unit of Life" (London: J. & H. Churchill; Philadelphia: P. Blakiston's Sons & Co.) is the title of a book printed as a memorial of Allan Macfadyen, who died a little over two years ago, the victim of an accidental laboratory infection. He was well known as an investigator of bacteriological problems, and particularly as an eminently successful student of intracellular ferments and endotoxins. For some fourteen years he had an important share in building up the establishment for the study of hygienic questions now known as the Lister Institute of Preventive Medicine. In 1901 he was elected to the Fullerian professorship in the Royal Institution of London, and the book contains three of the courses of lectures given by him during his incumbency. The title is that of the first course, the others dealing in more detail with cellular physiology and the methods of investigating cell activities. To these are added earlier lectures on toxins and antitoxins, and another address, all given at the Royal Institution. The treatment is popular in the best sense of the word and without reference to the literature. There is necessarily some repetition, but the book is a very attractive introduction to this special line of biological research. As the most recent of the lectures was given seven years ago, time has modified some of the statements. The editor, Dr. R. T. Hewlett, who was associated with Macfadyen in some of his researches, has endeavored to overcome this defect by an occasional footnote. He also gives a brief biography and a list of Macfadyen's principal papers, forty-two in number.

"Plant Study, with Directions for Laboratory and Field Work," by W. H. D. Meier (Ginn & Co.), consists of a convenient portfolio containing blanks to be filled by the student. There are thirty-five progressive studies, which, taken together, cover a large part of the field of botany, and constitute a good introduction to systematic works. We have serious doubts whether the verification of some of the points presented at the head of the pages is within the power of the average student; and if the points are not verified by actual observation, the laboratory practice falls short of its ideal aim. Some of the questions suggested on these blanks are, we fear, beyond the personal reach of a good many teachers, to say nothing of the pupils themselves.

Dr. Edgar Holden of Newark, medical director of the Mutual Benefit Life Insurance Company, and president of the Association of Medical Directors of Life Insurance Companies, died on Sunday night at the age of seventy. Besides various monographs, he published three books: "Use of the Sphygmograph," "Health and Mortality of Newark for Twenty Years," and "The Waif from Minot's Ledge."

Art.

THE EIGHTH INTERNATIONAL.

VENICE, June 28.

Fourteen years ago I entered rather grudgingly the first International. Had not the green walks of the Public Garden looked irresistible I should hardly have been drawn from the lagoons and the old masters. In a similar spirit of dubious curiosity many made their first visit. The whole thing seemed odd. A municipal enterprise, international as yet chiefly in intention, no one would have given it many years of life. But live it did, with a surprising vigor. Its statistics of attendance became increasingly eloquent. It grew to be the best picture mart in Europe, just as the old exhibitions ceased to sell. In Venice and in other Italian cities it became the feeder of promising galleries of modern art.

Venice itself undoubtedly counted for much in this. Even more, perhaps, the principle of variety adopted by the permanent secretary and soul of the enterprise, Prof. Antonio Fradeletto. Where the exhibitions are selected by many committees from many nations, where warring factions practise their pet theories of hanging and decoration side by side, there can at least be no monotony. Two years ago it seemed that even variety had its limits. The long series of international galleries was becoming oppressive; even more so the "regional halls" where the Italian artists were exhibited side by side for no better reason than that they were inscribed in the same tax lists. But if I had grasped the meaning of the New Belgian Pavilion I should have seen that variety was merely taking a breathing space. Since then Cavaliere Fradeletto has given a wave of his magic wand, and England, Hungary, and the Munich Secession have built them galleries amid the trees; then another wave and the old mixed halls are become a most piquant succession of one-man shows.

Of the three new pavilions, that of Hungary most takes the eye. The barbaric, half-Oriental suggestion of its low bronzed portal, external archaistic mosaics, and vaguely pre-Raphaelite stained glass is oddly belied by the ultra-modernity of the exhibits. These Magyar painters and sculptors are essentially clever men, knowing in harmonies and arrangements, intending a fillip to jaded enthusiasms. Sometimes they do more. A peasant and his wife I saw literally frightened away by a sprawling nude that seemingly offered her heels through the massive portal. Other visitors seemed to find the apparition inviting. In general, this abundant and sufficiently diverting cleverness does not come to much. Very enjoyable are two simple and direct portrait heads *in tempera*, by Körösföl, able but more conventional the portraits of Glatter and Szenes. Márffy in the Green Room, a Paris-green interior provided with all manner of crosslights, translucences, and glimpses through shimmering glass, does the merely amusing thing almost superlatively well. Márk's Grisette, in yellow, who exposes a pearly shoulder before a blue-green park, is vivacious and fetching. These things solace but do not thrill.

Better than all the painting, I liked Simay's monkey groups in bronze. He works the beasts out in their essential unmodulated planes, letting the tex-

tures go. These schematized beasts have a very touching quality. Perhaps the arts and crafts exhibit of Hungary is more significant than that of fine arts. One feels that the æsthetic overripeness of the painters may have its social value in raising the general taste. In any case, the decoration of the pavilion itself, the potteries of the Zolnay Company—adaptation mostly of Chinese and Japanese types—the lace patterns and laces produced by the National School of Decorative Arts, the stamped leathers designed by Lakatos, all suggest a progress in applied arts that other nations may envy the Magyars.

From wont and use the shock of the Munich Secessionists has diminished. They are unflinchingly uniform in their singularities. Their pavilion, a simple classical structure, shows within the familiar Whistlerian hangings in whites and silvers. Von Haberman's nudes have their old wriggling vivacity. Von Keller remains an illustrator of quality and a soberer technician than most of the group: Albert Weisgerber scores the sensation of the show in A Summer's Day. A picnic party of leering men and women observe a skinny nude who staggers (dances?) under a crudely indicated forest roof. The picture is humorous in a bestial fashion, but hard to swallow even as a joke.

Happily, the "secession" has its serener contributors. Borchart's village scenes are wholly unpretentious and charming. He has not merely studied, but really assimilated his Whistler. It is a disappointment to find Fritz von Uhde over-emphatic and colorless in his portrait of Wohlmuth as Richard III. The subject itself, Richard raving before a blazing battlefield, seems simply impossible. That so gentle a talent should have attempted it is distressing.

After these two up-to-date exhibitions the English show is reassuring. A porticoed Georgian house offers six galleries hung in deep blue, pale mauve, and terra-cotta. Here are Lavery, always distinguished, in two female portraits and an Oriental subject; Anning Bell in a rather thin poesy entitled Calumny—fair women speaking ill of a fairer; Sir James Guthrie in a characterful portrait of Mrs. Warrack; Charles Shannon very delightfully retrospective in the portrait of The Lady with the Plume—a picture as sensitive as the Reynoldses it vaguely recalls; Rothenstein in a charmingly arranged study in rose and yellow, called My Wife's Studio.

That capable executant, William Orpen, represents almost alone the ultra modern. He paints himself in a marvellous round-topped "topper" (or is it merely an over-extended "bowler"?), with his back firmly turned to the white torso of an Hellenic Venus. Both are seen in a studio mirror. The conceit is entitled I and Venus; it is rendered brilliantly and with humor, and I have no quarrel with it except for its size.

In McTaggart's Scotch grainfield, with a moor behind and a tumbling sky, the indications of the accidents of the landscape are both sure and free, quite in the best tradition of the British School. As for W. Y. Cameron's A Yorkshire Seaport, it gave for the single time in a dutiful round at Venice the thrill that one gets from a Claude. The picture is of utmost simplicity, just a stretch of pale warm sand, a tower, and group of houses profiled in warm brown against a pale greenish yellow sky that deepens above into evening blue. The rest is merely the silence and serenity of the evening hour. It is the kind of subject that the amateur inevitably tackles and does abominably. Here, it seems to me consummately well done.

I find it a little difficult to express the comfort I take in the English pavilion as a whole. The actual achievement is perhaps not extraordinary, but these men have retained certain fundamental characteristics of sobriety and humility. Here, I hope, is a soil out of which something much finer might grow. Elsewhere I find prevailing anarchy and pretentiousness that promise nothing except speedy self-exhaustion.

No land seems more in a ferment than Belgium. In a single tiny hall we find the drastic romanticisms of James Ensor—a warmed-over Watteau devoted to symbolistic caricature; the joyous impressionism of Camille Lambert, In Longchamps: the Flower Fête; and the tense, ghastly, yet gripping Pre-Raphaelism of Jef Leempoels's portraits. Surely, Belgium is in all the movements. Elsewhere one has the familiar symbolism of Khnopff, and Gustave Oleffe's continuation of the tragic manner of Meunier. Then you have the soberer landscape methods of the Scandinavian in Verstroeten's big snow scene, with keen reflections in the crust, and the purest practice of the dotted method (*pointillisme*) in the group of artists Buysse, Claus, de Saegher, and the De Smets who paints the river Lys. The little hall devoted to this group is so singularly uniform that a confiding soul might say, "At last truth; here are forty painting as one." I fear it only means that restricting the palette to the primaries and the brush stroke to a stipple makes inevitably for monotony.

Mural painting is rather scantily represented at the International. Galileo Chini's permanent decorations of the dome of the administration lobby seem of most importance. For the eight compartments of the dome he has chosen as many periods in the history of art—Primitive, Oriental, Greek, Byzantine, Mediæval, Renaissance, Baroque, and Modern. By cutting off the top and bottom of each compartment, treating these portions as decorative panels, the figure compositions are reduced to manageable oblongs. The conventional patterns of a semi-Byzantine character are of great ingenuity and variety. The whole effect of gold, bright blue, crimson, and orange is garish as yet, but time will tone it. For the compositions full of symbols bearing emblems I cannot say much. The scale is too small and the arrangement too confused to count at the height. Moreover, the invention, with nude geniuses carrying statues, etc., emblematic of the period, displays no originality. Aristide Sartorio exhibits very interesting large sketches for a frieze. It is to adorn the House of Parliament and symbolizes in a dense composition of nude figures and horses the aspirations of the Italian people—Courage, Justice, Faith, etc. Sartorio displays once more in the contorted and novel yet usually harmonious poses of his figures his really extraordinary mastery of the nude. One fears that the mere cumulation of figures and the apparent tendency to monochrome may land him in a kind of Doréism. In general, the compositions, though very rhythmical and varied, seem too crowded to promise a monumental effect, but a critique must naturally wait upon the finished work.

Sculpture is more abundant than excellent. In this field I can hardly conceive a more colorless exhibition. One must except Calandra's charioteer in high relief, intended for the Zanardelli monument at Brescia. It is fine along thoroughly safe and conventional lines. Otherwise, out of the mass of competent work there is little that grasps one. Stuck and Zorn, to be sure, are piquant in their various fashions. Our American exhibitors, Bartlett, Aitken, French, Eberle, Pratt, Roth, and Mrs. Vonnoh, are represented by small pieces which give an impression rather of *finesse* than of robustness. Prince Troubetskoy's animals and children are, as always, most engaging.

The American show under the auspices of the Academy is the best that Venice has seen. Surely, there is no abler group of portraits in the show than that composed of De Camp's 'Cellist, Cecilia Beaux's Mother and Child, Sargent's Miss Helen Brice, Tarbell's Dr. Edward Robinson, and Alden Weir's Portrait of a Girl. With these Irving Wiles's Julia Marlowe and Robert Henri's Girl in Black keep worthy company. Possibly the retrospective principle has been pushed to an extreme, as the list may already suggest. Here is a capital little Leda and the Swan painted by Brush about twenty-five years ago, not to mention those departed glants, Homer Martin and Alexander Wyant, in rather unimpressivè examples; besides Blakelock and Twachtman. An excellent nocturne by Ben Foster, a snow scene by Ochtman, and Childe Hassam's Old Church at Lyme, a picture of great distinction which rightly holds the place

of honor, represent our current landscape in varying phases and pretty nearly at its best. Coffin, Ranger, Redfield, Schofield, Charles H. Davis, I can merely mention, though their contributions are of an interesting sort. Benson, Carlsen, Paul Dougherty, Snell, and Woodbury send good marines. The comparatively neglected category of figure painting includes Kenyon Cox, Daingerfield, Sergeant Kendall, Genth, Loeb, among others. Genre painting is almost wholly absent, though William Hays sends a spirited Trotting Race. Here contributions by Glackens, Jerome Myers, or George Luks might have filled a perceptible gap acceptably. Nothing in the American room gave me greater pleasure than George Bellows's On the Hudson, a picture full of wind and tide and sense of place. Very delicious in quite a different way I found A. B. Davies's After Supper—a spectral group of little girls profiled against a steely estuary beyond which soars a ghostly New York. Davies is a constant surprise and joy for the variety he contrives to deploy within his well-marked mannerisms. There is about this little picture an imaginative quality and a beautiful strangeness in arrangement and color that fix it in the memory.

In general, the American exhibits are pitched in too low a key to catch the casual visitor. They lack exhibitionistic quality, which, in my eyes, is a merit. They represent a high level of technic, a reverent approach to nature, and, on the whole, a rather weak invention. These painters see pictures rather than make them, and they accept a bit too readily the first pictorial motive that nature presents. It is this that makes me wish that an indubitably inventive talent like Ryder had been included, or, perhaps better yet, something of Mr. La Farge's best. Our painters seem to emerge with difficulty from the tutelar stage. Yet the American thing begins to define itself. Hassam and Tarbell, among others, mean a very definite accomplishment, Dougherty and Bellows a splendid promise. The best of it is that most of it seems straight goods with a minimum of trick or pose. The foundation is being laid upon which the men of commanding genius may readily build if they will first consent to be born.

Ettore di Tito is a painter who declines to be bound by his formulas. A robust draughtsman, in a manner an illustrator, his pictures are usually finer in their parts than as wholes. There is life in him. The fisher lass straining at the tow rope, the young gentlewoman holding a spirited horse, share a common sincerity and actuality. Certain little pictures of half-naked children wading in the lagoons are exquisite in color and most true to the humid atmosphere of Venice. But, in general, his color is merely adequate, and his larger compositions tend to disintegrate into engaging fractions. He is at the heights of his activity, still progressing, and probably yet has surprises in store for us.

Here should come Besnard, Stuck, etc., but first a word on a few other Italian painters. Among the many who paint Venice to-day, Guglielmo Ciardi is one of the most attractive figures. His manner is mild, his mood patient. He lets the intricate beauty of sparkling water and drifting cloud come to him slowly, and invents charmingly unobtrusive methods for conveying it to the canvas. It is a pensive and modest art, and these qualities are not common enough here to be ignored. Zanetti treats these same subjects with far greater swagger and naturally with less intimacy. His work invigorates. Mancini's portraits still put down all others for sheer mass and vitality, but his color grows oppressively hot, and his lavishness of heavy impastes increasingly disagreeable. I cannot share the national enthusiasm for the sleekly staring portraits of Grasso, nor does the pearly nude that Arturo Noci unfailingly exhibits seem to me anything better than very pretty. Among all the Italian easel painters, I find no more specific talent than that of Marius Pictor (né Mario di Maria). His paint has a very precious quality whether it means roofs phosphorescent in moonlight, or trees, grass, and sky saturated with August sunshine.

Being an old and fervent Besnardian, it pains me to acknowledge how much his exhibition disappointed me. Here are fine things—the portrait of Princesse Mathilde with its lamplit bouquet of scarlets and crimsons, the pallid and impressive effigy of his wife; here is an amazing picture—study I had nearly said—of life-sized horses kicking off flies; here are Oriental iridescences of the familiar orange, blue, and pearl; here are nudes as incarnadine and sprightly as ever Fragonard himself painted. Why should it all strike one as a little tricky – the sport rather of amazing finger tips than of a fine intelligence? Partly, I'm afraid because that is the fact; even more, surely, because the more serious side of Besnard, his mural decorations, is unrepresented.

Anders Zorn is so engagingly and uniformly himself that after the first time he leaves a critic very little to say. One looks to him for a probity of workmanship that almost, but I think not quite, connotes genius. He withdraws himself. His fidelity to appearances is extraordinary. You would realize that the portrait of Mr. James Deering was that of a clear-cut American gentleman, and the likeness of Prince Karl of Sweden that of a high born Scandinavian, before you perceived that either was a Zorn. The most primitive of our artists—for he embodies an almost lost zest in fine craftsmanship—he can be the most modern. He paints you Miss Hilma Erickson quite nude, seated oblivious of you on a bearskin—a mere primitive thing seen, not a vision; and he will evoke also an extraordinary and wholly modern vision, like the Beer Hall here, with its many cross lights and reflections, or Mrs. John L. Gardner's even more memorable picture The Omnibus. But vision is, on the whole, rare with him. His arrangements are adequate rather than fine. One finds the true man not in the pondering of a work but in the doing. There everything is precious—the whittling of little nudes out of wood, the sweep of the etching needle over the copper, the sabre stroke of the brush that implies the whole contour of a nude. The finest things we probably shall never have from him, but we owe him much for remaining his own man and resolutely declining to cheapen his great gifts as a craftsman.

No serious person not a German need say anything much about Franz von Stuck, and I shall say little. Except for the delusions of greatness that so abound in the Vaterland, no one with so small a ballast of imagination and manual skill would ever be reckoned as a great painter. But Germany at this moment requires a great painter, and Franz Stuck has uttered his *adsum* so clamorously that it has been not only heard but believed. The violence—not strength—of his inventions contrasts pitilessly with the essential feebleness of his workmanship. He affects few contrasts less drastic than vermilion or pale blue, shot athwart a pitchy background. His color is not merely harsh and discordant, but poisonously disagreeable. I cannot remain long in the Stuck room without physical discomfort, and where I see a reassuring thing, I recall a finer original, for he drinks from many cups. Look at the painting of the gown of his daughter, travestied as a Spanish Infanta, and then think that this hard metallic stuff indecisively worked over with the brush, is in emulation of—or more kindly, in homage to—Velasquez! Mere assertiveness and oddity have so frequently passed in our day for greatness that nobody need be either surprised or offended when the phenomenon passed from politics to painting. The German visitors all fonnd the Stuck room either *Colossal!* or *Ungeheuer!* I am ready to admit that it was both.

Kroyer is a talent of the whimsical sort, with a shade of the sweetness that often accompanies that temperament. Almost as keen a transcriber of appearances as Zorn himself, he is at his best when he paints old men caught in the humors of business or deliberation. The carefully composed portrait groups seem to me his most serious, and a very wor-

thy contribution. Such little pictures as the Stock Market at Copenhagen, or The French Jury of Fine Arts, should be looked at with interest hundreds of years from now, for they are true and genial documents of our time. More intimate and appealing is the group of intent thoughtful men listening to music in the gloom of the painter's studio. These things seem to me remarkable instances of a difficult *genre*, in which modern painting is wofully weak.

Only an Æsop could moralize the International as a whole. I must conclude with mere jottings. The Western world is as far as ever from an accepted technic in painting, or from an approved and limited number of technics. The black manner and the chrome-lake manner, the unmodulated planes of Manet, the spots of Monet, the dabs of the "divisionists," the fused modelling of Velasquez, the "close" tonalities of Whistler, the sleek polychromy of the Institute, the slashing direct stroke of Hals, the cautious over-painting and glazes of the old Venetians—all have their adherents, and the result is surprisingly monotonous. It seems that very few pursue a technic to the height where it becomes a genuine means of expression. Too many of these painters put on their style as they do their black velvet smoking jackets. I suppose we shall have no end of this confusion, so long as the wholesale half-teaching by the schools and academies persists, and so long as we lack artists strong enough to invent and impose definitive procedures. We should, doubtless, be better off, *mutatis mutandis*, if we could say, as France could, in the eighteenth century, that there are only two manners—that of Raphael and that of Rubens. We need something to steady us against restless and inconclusive experimentation considered as a good in itself. But the mountain will doubtless continue to labor and the usual number of small mice will not be denied us.

Something might be done, perhaps, by a public that wished second thoughts and appreciated moderation. The appalling vice of this as of most exhibitions is the lack of relation between scale and subject. Graziosi, one of the cleverest younger Italians, gives us Treading Out the Must—a mass of trampling legs and swinging bodies in sunlight as it might be glimpsed from a motor car through a gateway. It is immensely vivid and able, but unarranged and unselected, hemmed in by its frame—a brilliant snapshot not a pondered vision. The Kermesses of Rubens teach another lesson. Besnard's life-sized itching horses again win no impressiveness from their bigness. It could all have been said better in smaller compass. In fine, subjects have their appropriate scale in painting, as in poetry. If Ettore di Tito and Graziosi are usually too big—the prevailing fault—Chini, in his dome decorations, is too small. But, alas, how many of the overgrown pictures were made, not even like the cast-iron razors to be sold, but only to be exhibited. Exhibitionism, *Mm. les artistes*, there is the enemy! F. J. M., JR.

Dr. Arthur Evans has determined not to excavate this year at Knossos, Crete, but to work up the mass of material already at his disposal. But a find of stone vases at a spot near where the royal tomb was discovered led Dr. Evans to investigate that site. This resulted in bringing to light a stone sepulchral chamber with a pavilion-shaped roof, dating, as is shown by the pottery found on the spot, from a relatively early period—the "Third Middle Minoan," that is, about the eighteenth century B. C. Though the tomb had been plundered, it still contained some important objects, including a gold-mounted intaglio of a Molossian dog with two men, and a gold ring with an engraved design of four women dancing, with a religious ceremonial above. The dancing figures bear a resemblance to those on one of the miniature frescoes found in the palace of Knossos. These discoveries have made it possible for Dr. Evans to fix the site of what is apparently a large cemetery of the same date, earlier than the necropolis already excavated. In the little palace on the west side was found the lower part of an Egyptian diorite vase, probably not later than the thirteenth dynasty, with the remains of an Egyptian hieroglyphic inscription, which seems to refer to an official charged with mining operations.

The investigations of Commendatore Boni in the Forum are again yielding notable results. The excavation of the last two remaining graves in the prehistoric necropolis of the Forum is now completed. In them were found large jars of clay, which served as receptacles for clay models of huts containing bones and ashes, and orientated in the same direction as all the huts previously found in this burial ground. Fibulæ and vases have also come to light. Commendatore Boni ascribes the date of these graves to the eighth or perhaps even to the twelfth century B. C. In addition to these excavations the work of removing the earth from the Basilica Æmilia has been almost finished, and investigations have been made with regard to a curious sacred well which was discovered beneath the so-called Church of S. Cesario, on the Summa Sacra Via, between the Arch of Titus and the Colosseum. The well belongs to the republican period and is approached by a flight of steps, which, however, date from mediæval times. Commendatore Boni believes that it was connected with the rites of "incubation," or the practice of sleeping in temples in order to secure a cure for diseases. At a later period a large dolium was inserted in the well to raise the level of the water, and this has now come to light.

The committees on the competitions for the prize of Rome have awarded the scholarship in sculpture to Paul H. Manship of New York; in painting to Frank P. Fairhanks of Boston, and the first honorable mention in painting to Henry Lawrence Wolfe of Philadelphia.

The Académie des Beaux-Arts has awarded the Prix Leclerc Maria Bouland (3,000 francs) to Jules Zingg, the Prix Meurand (1,000 francs) to L. Montagué, the Prix Édouard Lemaître to R. Huet, the Prix Desprez to M. Iselin, the Prix Maxime David to Madame Gruyer-Brielman, and the Prix Eugène Piot to E. Rosset-Granger.

From Bremen comes the news of the death of the painter and dramatist, Arthur Fitger, in his sixty-ninth year. As a painter he is perhaps best known for his Bremer Ratskeller. Among his plays are "Die Hexe," "Von Gottes Gnaden," and "Die Rosen von Tyburn."

Finance.

The truth about the pending Panama bond issue is patent. The Treasury's working cash balance has become uncomfortably narrow. Extravagance has brought it to a low ebb. The working balance last Friday, for instance, was less thn $25,000,000. The deficit for the month so far has amounted to over $9,000,000. The Treasury's balance with the banks is $56,000,000, and is being steadily drawn upon. The talk about the bond resources of the Treasury being ample apart from new legislation is largely pretence. The remainder of the former Panama issue authorized but not issued is simply not available. The government cannot float a straight 2 per cent. security. It succeeded in cajoling the banks into subscriptions for the 2 per cents. by virtually guaranteeing to make deposits of public funds with the purchasing banks on the security of the bonds in question. The Treasury has now no funds to deposit with the banks. It is rapidly withdrawing what balances it has. It has got down to hard pan, and cannot borrow at a 2 per cent. rate. The $100,000,000 of 3 per cent. short time certificates authorized but unissued are a dubious potential asset at best. The Treasury officials are properly shy of issuing short time 3 per cent. certificates. This would but put off the evil day by less than a year, when, conceivably, circumstances might be even more unfavorable for the sale of long-time securities than now. Under these circumstances the 3 per cent. rate is an obvious commercial necessity though the purchasers of the 2 per cents. may gnash their teeth. The Panama Canal project is used as a handy

means of saving the government's financial face. We started to build the canal out of surpluses of current revenue. Extravagant expenditure and trade depression turned the surpluses into a negative quantity. The result is a dearth of ready cash, and, under guise of returning money spent on the canal, the Treasury is using the new Panama bond project to get the funds to pay for its daily bread and butter.

The difficulty connected with the proposed issue is triangular. At one corner is the growing deficit and the dwindling Treasury cash balance. At a second corner is the loss to be incurred by slackening the construction work at Panama. And at the third corner is the danger of note inflation and an indefinite postponement of doing away with a bank currency based on specific bond security. There can be no dispute about the necessity of replenishing the Treasury's cash. No one seriously proposes shutting down on the Panama Canal construction. The avenue of escape is the issue of a long-time obligation, presumably a 3 per cent. bond. Here the difficulty is that the note circulation would at once expand. When the enlarged circulation has once served to help the banks to move the crops, the circulation will prove excessive, and a part of our basic currency—gold—will be expelled. The most reasonable plan, then, would seem to be to issue as required long-time obligations at such a rate as the market necessitates, with the express provision that the bonds issued shall not be available for the purpose of taking out note circulation. This will raise the nominal rate of interest which the Treasury must pay. But the other policy, of allowing the new issues to subserve note inflation, will only conceal the true rate of interest, and will make mischief in future when currency reform is attempted.

The Week.

Insurgency as a temporary condition has plagued the Republican leaders sorely. Presumably, they would be still less pleased if Republican insurgency were to become a habit. From that to open rebellion and revolution the descent is easy. There are indications that the minds of men are turning towards the possibility of permanent cleavage within Republican ranks. Secretary MacVeagh has openly threatened the Republicans with a realignment of parties, if the party now in power fails to recognize the changing spirit of the times. Senator Gore's speech of Saturday was more jesting in tone than in import. He was merely stating facts in saying there are persons in the Democratic party who ought to be in the Republican party, and persons in the Republican party who ought to be in the Democratic party. But we are getting down to something of a programme when Senator Gore advises that the Democrats refrain from putting up candidates against the anti-Cannon Republican Congressmen. In return—politics always demands something in return—Democrats running against stand-pat Republicans ought to have "a reasonable hope of assistance from "progressive" Republicans." What large hopes of a third party, anti-tariff and anti-Trust, Senator La Follette is carrying about with him, one cannot definitely say.

Senator Culberson makes a belated and pretty futile attempt to show that the Democratic record on the tariff in Congress was not so bad, after all. The Texas Senator seems to think that a little ingenious figuring and explaining will correct the general impression. First, he asks us to leave out the votes on iron ore, coal, lumber, and hides. On them, he admits, many Democrats went wrong; but those were the very items on which the Democratic party had most explicitly committed itself, and recreancy here is fatal to any pretence of loyalty to pledges. It is of no avail for Senator Culberson to point out that the Democrats were "in effect unanimous" for reducing the duties upon many articles of common use. The critical votes were those in which Aldrich needed Democratic help, and got it; and he doubtless could have got it, if it had been necessary, on the schedules which Senator Culberson specifies. Nothing that can be said or alleged now will break the effect produced by the display of ratting on the tariff, which Democratic Senators and Representatives have given in the extra session of Congress. The country may be disappointed with the measure of tariff revision which the Republicans will give it, but nobody can now convince it that it could have got any revision at all if Bryan had been elected.

The appointment of William Franklin Willoughby, the present Secretary of State for Porto Rico, to the position of Assistant Director of the Census, is another gratifying evidence of the President's desire to make that bureau a highly competent instrument for scientific investigation and research. Secretary Willoughby has been in the government service since 1901, serving first in the capacity of Treasurer of Porto Rico, and more recently as Secretary of State for the island. In the absence of the Governor he has also acted in his stead. To say that the Bureau of the Census has not been regarded uniformly as a scientific arm of the Federal service, is to put the matter mildly. It has been at times a sort of private hospital run at public expense for the personal parasites of the politicians. In the character and competence of the new Director and Assistant Director, we have a guarantee of better things.

The Treasurer of the United States has been conferring with New York bankers about the possible effect of new bond issues upon the quotations of Government securities. The situation makes one thing clear beyond cavil, that the market prices of United States bonds are a very imperfect index of the Federal government's credit. The error dates back at least as far as the publication of "Triumphant Democracy," and assumes that the relative credit of this and other countries can be gauged by comparing the prices of public stocks bearing the same nominal rate of interest. The truth is that our 2 per cents, which are but barely above par, convey a double income to their holders—the banks—besides the advantage of exemption from tax-liability. To the 2 per cent. paid as interest are to be added either the profits on the note circulation based on the bonds in question, or the gains made by holding public deposits for which the bonds stand as security. If it is desired to keep above par the market quotations of our 2s and 3s, there would seem to be an additional ground for denying to the purchasers of the new Panama bonds the right to take out circulation based upon the bonds in question. The dilemma which the Administration faces is just this: If the new Panama bonds are made available for circulation, the public credit will evidently fall, and the 2 per cents may go below par. If the new bonds are not made available for note circulation, an entering wedge will have been driven into the present system of a currency based on deposited securities.

The Assistant Secretary of the Department of Labor and Commerce, in his recent speech before the Commercial Law League at Narragansett Pier, dwelt upon one great defect in our industrial system. It is the failure to distribute congested labor where labor is greatly in demand. There is an unmistakable anomaly in Western farmers crying for hands and Eastern cities endeavoring at the same time to cope with the problem of unemployment. So far as trades unions act as clearing houses for requests for jobs and demands for workers, they perform a public service no less beneficial to themselves than to the country at large. Unfortunately, the workers most likely to be stranded, especially newly arrived immigrants, cannot avail themselves of the employment bureaus of the trades unions. We have daily to witness the truth of Adam Smith's dictum, that "after all that has been said of the levity and inconstancy of human nature, it appears evident from experience that a man is of all sorts of luggage the most difficult to be transported." Mr. McHarg urged that advices should be forwarded to Washington regularly as to the condition of

Burlington Public Library

local labor markets. This is what we do already in the case of the wheat, cotton, and iron markets. It might help in securing a better distribution of labor power throughout the country—a task which the immigratiou officials may very properly study. Of course, there will be unemployables under any system, for "unemployment" is unfortunately a specialty of some who find that they can live without labor.

The Employers' Liability Act, passed by Congress on April 22, 1908, cannot be enforced by a suit brought for damages in a State court. This is the unanimous finding of the Connecticut Supreme Court of Errors in a decision handed down last week. The case was one where William H. Hoxie, a train hand, injured in coupling cars by the negligence of a fellow employee, sued the New York, New Haven and Hartford Railroad for damages. It will be remembered that the original employer's liability act was declared unconstitutional. The present law was designed to avoid the errors into which the draughtsmen of the original statute had fallen, and was passed at the hot insistence of Mr. Taft's predecessor. The soul of the act is that in industrial accidents arising in interstate commerce, the employer may not plead in defence the common-law doctrine of fellow-servant. The Connecticut decision would seem to imply primarily that a Federal court is the only proper forum for damage suits brought under the law in question. It further affirms that Congress has no power to compel State courts to assume jurisdiction in such causes. The unconstitutionality of the act is also seemingly implied in that it requires State courts to disregard, in special cases, the law of fellow-servant, irrespective of the particular commonwealth's law.

The Dominion Finance Department has determined to deport the American silver coins now current in Canada. It is estimated that 30 or 40 per cent. of the silver circulating in that country bears the stamp of the American mints. In some of the western provinces fully one-half of the silver coinage emanated from this country. The Canadian banks are to begin impounding the coins in question. When the silver is exchanged, or is redeemed in standard money by our Treasury in units of twenty dollars or multiples thereof, Canada will have realized about twice as much as is required to purchase silver bullion to replace the expelled American coins. The other half will be seigniorage, or gain to the government of the Dominion. The acceptance of American silver in Canada has been customary for years, although on this side of the border Canadian silver has generally been received with reluctance, or accepted only at a discount. "Riches," according to the proverb, "take wings," but evidently silver coins that have suffered a seigniorage exemplify the adage only for a time. After all, we have nothing to complain of. The very purpose of exacting a seigniorage on subsidiary coin is to prevent them from seeking a foreign market or the melting-pot. The gain from seigniorage results at issue, and accrues permanently only when the coin remains in circulation. When the coins are redeemed, the seigniorage is lost again.

To say that Bleriot's flight across the Channel last Sunday was dramatic is not necessarily to say that it can have no practical results. It may be months before another man will duplicate Bleriot's exploit, though the chances are that it will be done much sooner. Bleriot himself might not be able to repeat his flight the next half-dozen times he tries, though the chances are that he would. But the practical result of his achievement is in the fact that something which man has done once becomes a spur to a thousand other men to attempt the thing again. It was no utterly wild guess that in this country alone ten thousand men are now experimenting with airship and aeroplane. A victory like Bleriot's swells this army of inventors and would-be inventors.

Dr. Huntington was long rector of a prominent church in New York; but it is neither that fact, nor the host of friends and admirers he conquered, which invites to newspaper comment upon his career. He was a clergyman who held his own in a day when the clerical profession has been slipping back. Others of his calling have felt this insensible decline of influence and of importance, and have by various devices sought to recover lost ground. Some of them have cheapened themselves into vulgar advertisers and sensationalists. Not a few have wreaked themselves upon the temporalities of the church: have made themselves business managers; have organized instead of preaching; made more of clubs and classes than of prayer. All these tendencies of modern organized Christianity beat full upon Dr. Huntington, as they do upon every minister to-day, but he was not swept away by them. Being of his age, he could not help taking of its color. Grace Church has fallen in with the current set towards "the institutional church," and Dr. Huntington's firm and directing hand was upon all this multifarious activity not directly of a religious kind. But he did not waste himself in that sort of effort. He held himself to the older clerical ideal. Of a type which seems to be vanishing, he was a fine illustration of its power, even in a generation grown dull to excellencies such as his.

This clergyman remained all his life a student and a thoughtful preacher. If there were groundlings in his audiences —as there are in all churches—he would not stoop to tickle their ears. It was his way to add reflection to knowledge, and to lead his hearers to consider high themes in a spirit of grave inquiry. Dr. Huntington occasionally preached on "current topics," even on political matters, rarely. Being a citizen of this breathing world, he could not be indifferent to what his fellows were thinking and doing. But in all his attempts to bring lasting truth to bear upon passing events, there was no clamor or posturing. It was not essential to his comfort that the press should print his sermons, or that reporters should lurk in the pews before him, on the watch for some phrase that would look well in a Monday-morning headline. Dr. Huntington was absorbed with the work he had in hand; addressed his immediate audience, and cared little for a wider public, except as it might be reached through those who passed on the impulse got from direct contact with him.

Last Saturday's great demonstration in London, by workingmen, in behalf of Lloyd-George's budget, is an indication of what would happen should the Lords throw out the bill. The issue would at once be changed, and a close alliance, if not an actual union, brought about between the Labor party and the Liberals. What such a step might easily mean in electoral returns, was shown a few days

ago in the bye-election in Mid-Derbyshire. There the Liberals and the Labor party put up unitedly as candidate a member of the latter. He was elected by a majority of 2,343. This, to be sure, was less than the abnormal majority of 3,509 which the Liberals obtained in 1906, but is more than double the Liberal majority in the three previous elections. Mr. Balfour is certain to think twice before provoking everywhere a combination that would be so formidable for the Conservatives to face.

At the moment unexpected, M. Clemenceau's fall does not come altogether as a surprise. And the reason why this veteran politician has been latterly exposed to defeat rests, oddly enough, in the fact that logically he is the best man for his place, and that the majority of Frenchmen seem to have felt this to be so. Between revolutionary radicalism and the old forces of reaction, M. Clemenceau has held the balance, not too rigidly, perhaps, but as well as might be, under the circumstances. The Right and Moderates, up to the recent postal strike, reproached him with making concessions to the lawless elements. But to have expected the Premier to take drastic measures against labor agitation would be to overlook the strength of the radical idea in France, manifesting itself in gradations from Clemenceau and Briand, through Combes and Jaurès, to Gustave Hervé. On the other hand, when the labor agitators began to threaten the Government itself, M. Clemenceau put his foot down with a degree of emphasis that won the approbation of even the Right. But if Clemenceau could adapt himself to the varying moods of the French people, he could not hope to cope permanently with the shifting moods of Parliament. Holding the balance redounds to the benefit of the people, but it creates numerous hatreds in the hearts of Deputies. And sometimes the sum total of such hatreds is enough to swamp a logical majority. The immediate cause of the overturn would really seem to have been his sharp tongue. An assured majority was turned into a minority by the Chamber's anger at the introduction of personal acrimony into a debate on what is probably the most serious question of the moment in France—the pitiful state of disorganization and corruption in the Navy Department. Here was a vital problem discussed by Delcassé, one of the most serious statesmen France has produced in many a day. As the head of the committee that laid bare conditions in the navy, Delcassé was speaking with knowledge and authority. At such a time, to evoke wantonly the unhappy memories of the Moroccan crisis of 1905, turned out for M. Clemenceau a fatal mistake.

Nobody in Germany appears to be pleased with the financial compromise which the Government finally accepted. In place of the ambitious scheme submitted to the Reichstag which was to wipe out deficits, consolidate the imperial finances, and make ample provision for the future, the outcome is a thing of shreds and patches. A series of rough-and-ready taxes was adopted, the yield and incidence of which cannot be predicted. The chief new or increased imposts are upon beer and spirits, tobacco and matches, and coffee. Then there is the tax on dividends and interest — the *Cotierungssteuer*—which was so strongly opposed by financial circles, but which finally they acquiesced in as a disagreeable necessity. The official estimate is that the added taxation will bring in a revenue of $125,000,000. But this is confessed to be largely guess-work. The *Norddeutscher Zeitung* recalls the fact that the tax reforms of 1906 were figured by the Government to produce between $50,000,000 and $55,000,000, though in the event the return was only $25,000,000. Should the present estimate prove equally over-sanguine, the Government would be far from out of the financial woods. In any case, the circumstances under which the Government was forced to compromise made a bad political impression.

One feature of the German financial compromise was not reported in the cable dispatches. It was announced in the Reichstag that the Government proposed to bring in a bill for taxing the unearned increment in land. In order to give due notice to all concerned, the new measure is to be introduced not later than April, 1911, and to go into effect one year from that date. And the yield of the tax is estimated at $5,000,000. Meanwhile, a check is to be put to municipal experiments in taxing the land increment. As is well known, several German cities have resorted to this form of taxation, with varying success. Their experience has been cited on both sides of the debate now going on in the House of Commons over the proposed taxation of the unearned increment in England. But when the new Imperial tax of that kind is levied in Germany, municipalities are to go no further with it. It is, indeed, provided that they may retain the revenue already accruing from this source up to 1917; but the further experimenting with a tax about whose operation little, confessedly, is known, will be done by the Imperial government. This last decision seems rather a pity, for the tax is, in the nature of the case, almost confined to urban and suburban land, and one would think that the cities could best feel their way in this sort of novel taxing.

South America's present state of mind may be described as one of belligerency modified by a strong aversion to fighting, and ignorance as to who ought to fight whom. But since the beginning of the trouble we have had discussions on the possibility of war between Bolivia and Peru, Bolivia and Brazil, and Chili and Peru. That war between Bolivia and Argentina should even be suggested, throws a new light on the difficult problems of international arbitration. The parties to the original dispute were Bolivia and Peru; the judge was Argentina. Here, then, is a claimant who is not only dissatisfied with the award, but wants to fight the arbitrator. Evidently, the nation that sits in judgment between her fellows must be either so much more powerful or so much weaker than either of the litigants as to make it impossible for the judge to be drawn into the dispute. Professor Scott, in his new work on the Hague Peace Conferences, points out the defects in arbitration by a sovereign. The case is submitted to him without argument, and he decides solely on documentary evidence; his decision "does not, as a rule, state the reasoning by which the conclusion is reached"; and, consequently, the judgment is of little value as a precedent. And, finally, there are the sovereign's own interests, which, in a dispute between Peru and Bolivia, would have made the President of Switzerland a better qualified judge than the President of Argentina.

REPRESENTATION IN THEORY AND IN FACT.

The student of politics is not infrequently confronted with a difficulty peculiar to that science. It is, to realize the identity of an institution described in the text-book with the real thing when studied at close range. Blackstone and John Adams each in his way befogged the students of political institutions for generations. Blackstone made current the idea that the British Constitution was a complicated maze of interrelated powers and forces into whose ultimate nature it were almost irreverent to peer. John Adams hopelessly misguided many a student of American Constitutional law by his juggling of "checks and balances." Not until Bagehot simply blew away the idea of "paper Constitutions," did we begin to see something of the reality of present-day politics. But the old method is less easily banished for good than temporarily exiled. Only contrast the "paper" theory of representation in some of the modern books on politics, with the actual situation as it appears to an intelligent person at Washington, provided he has never caught the infection of so-called political science.

The theory and the fact of representation will furnish a crucial illustration. If the traditional visitor from Mars were to make us a visit to study our system of government, we may imagine him providing himself, let us say, with Professor Jenks's "Principles of Politics." Under the title, "Representation," our Martian would first find the query propounded whether the M.C. or the M.P. should act as a representative, using his independent judgment on disputed issues, or as a delegate simply recording the preponderant view of the district for which he stands.

The alternative is commonly resolved in favor of the representative as against the delegate, though the ideal superiority of the first has never been put more forcibly than by Macaulay, whose verdict was that the electorate should choose wisely and then confide freely in their representative. After the ideal character of the legislator has been settled, the next issue raised concerns his allegiance—shall it be primarily to his constituents, or to the wider public, the country at large? Here the political doctors, Professor Jenks among them, resolve the *quæstio* in favor of the wider area of allegiance—but with some reservations as to particular duties to specific constituencies. One more matter settled in advance, and our Martian is ready to buy a railway ticket to Washington. What is the ideal basis of representation? Shall it be on the numbers of the population solely, with the attendant danger of the gerrymander? Or ought particular interests, like the laboring class, the farming class, the professional and the trading class, to send from their own ranks avowed advocates of these special interests?

Thrice-armed with the knowledge of the schools, our celestial visitant, let us suppose, takes the night express for Washington with letters of introduction to those in actual touch with affairs. What chance is there that he could discover an M.C. who would even avow that his allegiance in tariff-making was primarily to the nation as a whole? There would doubtless be many eager to protest that they are fighting tooth and nail, each for his own district. But if the man from Mars should follow them up, and ask *how* they had discovered the interest of their own constituencies, he would infallibly ascertain that a few influential persons whose profits are primarily at stake were the sole exponents, or alleged exponents, of the wishes or interests of the various districts. The truth is that in tariff-making the M.C. can hardly be called a delegate, let alone a representative. He is practically the special agent of the vociferous industrial parasite that has fastened on the country, but lives in his bailiwick. The present situation, for example, is quite plain. The only person who pretends to represent the general interest is outside of Congress altogether. Congress is making an organized effort to betray the general interest, and is stopped only by the power and influence of the President of the United States.

So far as the idea of representation based on classes is concerned, it is nearer the truth to say that, instead of not having introduced it into this country, we do not know any other system. Of course, the facts are carefully concealed. The agents of the cotton interests, for example, are disguised as members of Congress from certain enumerated districts. They commonly wear masks of partisan principles, or goggles and false beards that are stamped with geographical labels. They are themselves even hypnotized into a real belief in their own personal rectitude and independence. But unless there were an obstacle to their power, they would mark cash deposits for their ultimate political creators with the regularity of a cash register.

If a realist were to etch the outlines of our system of representation, it might run somewhat as follows: Personal ambition, a certain grade of ability, and amenability to the party machine will secure a nomination for Congress. This selection of the machine will be ratified at a so-called popular election. When a tariff measure is under discussion, the large contributors to the machine pull the wires that jerk the elected member. The clash of interests arranges through Congressional committees, and finally through a conference committee, a treaty that is as satisfactory a division of plunder as circumstances permit. The cost is paid by the ultimate consumer, who is a "myth." Barring any opposition from the representative of the "myths," to wit, the President of the United States, the representative system works to enrich its manipulators by a wholesale betrayal of the country at large.

THE NEW PROSPERITY.

It needs not the assurances of financiers returning from vacation, to convince the American people that better times are ahead. The signs of rapid and large recovery from our two years' depression are unmistakable. The country has even left off waiting for the passage of the tariff bill to "give the signal." Customs duties do not make prosperity; they can neither keep it when we have got it, nor retard it when it is coming back. Natural law, combined with the moral qualities of personal saving, economies in manufacture, prudence, enterprise, is doing the business. Even European observers, as recent financial dispatches have been showing, are now convinced, after long skepticism, that the American outlook is extremely bright.

Prosperity is coming, but it will not be the old prosperity. We refer not to its outward form or bulk or duration, but to its spirit. The enlarged business which is before us, the new displays of energy, the further growth and achieve-

ments of capital fruitfully employed in corporations and otherwise, will be marked by other methods. We shall not easily drop back into the old style of conducting the great business of the country. It is necessary and timely to dwell upon this, because many have been persuading themselves that the excitements, the reforms, the painful inches of progress gained in the past few years, were all to go for nothing and that we should settle back with swinish complacency into the mire where we formerly wallowed. And the evidence that this is not to be is plainly angering many. "To be blunt, wrote a member of the Union League Club to the *Sun* the other day, "William Howard Taft is a great disappointment to a host of people who had been looking to March 4 for a material change from things past to things to come."

The implication of such complaints is obvious. Reckless financiers had felt themselves disagreeably checked in their operations. They had intensely disliked the publicity, the inspection, the regulation to which their proceedings had been subjected. And it was a flattering unction to lay to their souls that all of that would pass away with a change of Administration. But they ought to have been keen enough to perceive that no force is lost in the political and business world, any more than in the physical. The efforts recently made to render business cleaner, and to hold corporations to a stricter accountability, were often violent, frequently ill-judged, and sometimes were but a tool in the hand of political ambition; but their intent in the minds of the people was honest and their effects were wholesome. Those effects will abide with us. Business will soon be larger than before, but it will be managed more cautiously and with more integrity than before. The counsels which we have taken to heart in a period of adversity, will not be wholly ignored when prosperity returns. There will not be so many impudent flotations, so many secret manipulations of property, near the verge of the criminal law. Promoters may hate the new provisions for inquiry and publicity, but they will also dread them, and work under a salutary fear that they may be applied to their combinations at any moment. A saner spirit and sounder methods will be visible in our great *entrepreneurs* and administrators of vast capital.

It was, in many respects, a very trying time which we were called upon to go through—a period of clamor, of wild and whirling words. But it was not entirely destructive. Out of the confusion have emerged certain large and clear principles, and they will remain in force. Public service corporations, for example, can never, not even by all the king's horses and all the king's men, be put back where they were before. If any of them hereafter are tempted to ask what the public has to do with their affairs, they will find that it has everything to do. And the same thing is true, to an extent, of every other kind of large business that touches our citizenship at a thousand points. A new attitude has come and it will persist. The ease with which the corporation tax is slipping through Congress, despite the intense opposition of powerful interests, is a clear proof that the popular temper is inclined to step forward rather than backward. No appeal by creatures of government, such as corporations are, against government "prying into our affairs," will longer avail. The answer is very like what Gov. Hughes is reported to have said last year when a delegation from the Stock Exchange urged him to commit himself against an investigation: "If your books are clean, you have no reason to fear an investigation; and if they are not clean, you ought to be investigated."

After investigation, the Stock Exchange found itself rather helped than hurt. And the assurance is given that the minor reforms urged by Gov. Hughes's Commission will be carried out in good faith. "Unlisted stocks," for example, are to be known no more in the Exchange, after April 1, 1910. Such a move for improvement in business methods is an admirable example of the way in which wise and far-sighted men will seek to adjust themselves to the new conditions. By holding fast to the good results worked out in our late troublous days, by accepting constructively the teachings of the dear school of experience, they will at once reassure the public, attract new confidence with new business, and cause the coming prosperity to be, in Oliver Cromwell's phrase, "without a worm in it."

FRANCE AND EUROPE.

M. Briand's Cabinet, the practical completion of which is announced, makes greater changes than were expected. Six Clemenceau men are left, six new men are coming in. As if to offset the presence of a former militant Socialist at the head of the Ministry, the other new members show a decided lurch to moderatism. M. Cochery, the new Minister of Finance, is more conservative than his predecessor, M. Caillaux. Millerand, who becomes Minister of Public Works, was once a terror to the bourgeoisie, but has long since grown tame. For the war and navy portfolios, M. Briand seems to have gone to professional men who are not so well known as Gen. Picquart and M. Picard, but who need not therefore be the less efficient.

Under Clemenceau, the French Republic was more than usually forward in the eye of the world. Its internal history for the period covers the epoch-making rupture of the connection between State and Church, the rise of a formidable revolutionary movement among the working classes, the appearance of the anti-militarist doctrine of the picturesque M. Hervé, and, in a narrower political sphere, the partial disintegration of the Republican *bloc* which since 1899 had ruled the country. Abroad, the Clemenceau Government had to weather a steady succession of crises in its relations with Germany, inherited from preceding Ministries; to carry on a difficult and dramatic campaign in Morocco; and to draw tighter the connection with England under stress of danger from beyond the Rhine. Where France was not directly a party to a quarrel, as in the Balkan crisis of 1908, she was nevertheless compelled to play an important part as the nucleus in a scheme of alliances and understandings which upheld the European balance of power against Germany and the Triple Alliance. Viewed in its broadest aspects, the Clemenceau régime was more than ordinarily successful. The Separation problem was solved, and the other internal questions we have mentioned were dealt with as ably as might be. The foreign prestige of France, Clemenceau left much higher than he found it.

Now that Briand has stepped into the Premiership, it is hardly conceivable that any sharp departure in policy will ensue. And this is not merely because Clemenceau's defeat is known to have

been largely of the nature of a personal reprimand involving no condemnation of the Government's general conduct. A new French Parliament is to be elected in the spring of 1910, and it stands to reason that no new Ministry will tamper with the principles that enabled Clemenceau to round out the longest Premiership in the history of the Third Republic. But aside from such practical reasons, there can be no doubt that a Radical government best suits the present temper of the French people. The general election of May, 1906, gave the Radical parties some 400 votes against 180 of the Opposition. If Clemenceau thinned down his majority by sending the Socialists disgruntled out of camp, he could afford to do so, because, splendid parliamentary tactician that he was, he could count on the support of the Moderate Opposition, just when the Socialists were the most refractory. He did this on the question of Morocco, during the strike trouble among the miners of the North, and in the recent postal-strike.

But even Clemenceau came to grief when he let himself put his trust in a paper majority of something less than one hundred. All the more reason for his successor to rally the entire Radical strength, and by winning back the friendship of the Socialists to cement anew the old Republican *bloc*. Such a consummation, the greater number of Radicals have long been devoutly wishing; for the breaking of the old electoral pact with the Socialists has cost them more than one seat in the bye-elections. Winning back the Socialists, however, is not an easy task, unless the Government is willing to go in for Radicalism with a vengeance. What a Ministry in alliance with the Socialists could have done in the postal-strike except surrender to the strikers, is hard to see. But, presumably, no such crisis will recur before election, and until that time a Briand may satisfy Jaurès and his followers with small concessions and sweet promises, while Jaurès may find it possible to forget that Briand is a renegade and a reactionary. Thus Clemenceau's friends and some of his enemies may get together, but that Clemenceau's policies will be overturned does not follow. It is to be truce within the old *bloc* till next year. After that, *qui vivra verra.*

Still less chance is there for a sudden alteration in the foreign policy of the French government. Though Delcassé brought about Clemenceau's downfall, the return to power of the Minister whom William II forced out of office can come only when the country shall swerve sharply from Radicalism and the policy of peace with Germany, and a Moderate Ministry, prepared to fight Germany with England's assistance, shall come into power. Such a contingency is still remote. It may be that fear of Jaurès and his phalanx may bring it about, but at present it is generally conceded that the policy of M. Pichon, Clemenceau's Foreign Minister, is the policy the country wants. In general, the probabilities are that foreign affairs in the immediate future will not be so prominently to the front in France as they have been these four years. Morocco remains a cause of some anxiety, but in view of the recent agreement between France and Germany concerning Morocco, a repetition of the acute crises of 1905 and later years can hardly be looked for. The troubled boundary for some time to come will be not the Rhine, but the North Sea. Since the latest Dreadnought attack broke out, France has been conspicuously out of the diplomatic news. Her concern in the development of Anglo-German relations is, of course, of the first order. In fact, if not in name, England and France are now allies. But while the two rivals of the sea are disputing, a French Ministry will pretty surely give its main attention to affairs at home.

THE FIGHT AGAINST OPIUM.

The Hague, which seems destined to become a permanent base of operations for international campaigning against all forms of human ill, may soon have a conference to discuss the international control of the production, manufacture, and sale of opium. Our State Department has extended invitations for such a conference to the governments that took part in the Shanghai Opium Commission of last February. These governments were the United States, China, Great Britain, France, Germany, Japan, the Netherlands, Portugal, Russia, and Siam. With the results of the Shanghai meeting, opinion in this country and in Europe professed itself much disappointed at the time. The commission in its report seemed to have confined itself to the expression of those pious wishes which Hague conferences of another kind have made familiar. In addition, it was reported that Great Britain's attitude at Shanghai was responsible for the failure of positive results.

Our State Department, however, takes a different view of the Shanghai Commission. It observes that the commission "was one of inquiry only," that its function was "to study the opium problem and report as to the best and most feasible means of solving it," and that this programme was executed "to the entire satisfaction of the governments concerned." Bishop Brent, who presided over the Shanghai Commission, declared in his inaugural address:

> It devolves upon me to pronounce with emphasis that this is a commission, and as those who are informed—as all of you must be in matters that pertain to international affairs of this kind—a commission is not a conference. The idea of a conference was suggested, but it seemed wise to choose this particular form of action rather than a conference, because, for the present, at any rate, we are not sufficiently well informed and sufficiently unanimous in our attitude to have a conference with any great hope of immediate success.

The commission embodied its findings in a set of resolutions. In imitation of the example given by China and other governments, every government was urged to take steps for the suppression of opium-smoking within its territories. The unrestricted manufacture, sale, and distribution of morphine constituted a great and growing danger; drastic regulation was immediately needed. Research for the purpose of finding scientific remedies against the opium habit was recommended. In some form or other, nearly every government regulates the use of opium for other than medical purposes, but a uniform code of procedure was desirable. In the specific case of China, the commission agreed that the government's efforts to suppress the opium habit were sincere and productive of real, if somewhat "unequal," results; but urged that foreign governments should take measures for the suppression of the opium dens within their Chinese concessions; and that all governments should take steps to prevent the shipment of opium or its derivatives and preparations to any country which prohibits their entry.

The campaign against opium is an international one, but primarily it is a Chinese and British question; for China is notoriously the worst sufferer by the

drug habit, and British India is the great source of opium supply. China followed up her anti-opium edict of 1906 by an agreement with the British-Indian government under which the suppression of opium cultivation within China and the importation of the drug from India were to be done away with in ten years. Its total importation of 51,000 chests, the Indian government was to reduce by 5,100 chests every year, until 1917. The Chinese government, with characteristic enthusiasm, set to work at taking its own opium lands out of cultivation. The Indian government, however, was not convinced that China was carrying out her part of the bargain. The British delegates at the Shanghai Commission moved a resolution regretting China's inability to produce trustworthy statistical evidence on the question. The resolution was withdrawn, but it showed the British temper. China, on the other hand, proposed that foreign governments should pledge themselves to reduce their exportation of opium to China in proportion to the reduced production of the drug within the Empire. This resolution was also withdrawn; had it been agreed to and ratified, China might conceivably have wiped out British importations at one blow by enforcing total and immediate prohibition of opium-growing within her boundaries.

In choosing The Hague for the next opium conference, our government adroitly emphasizes the international aspect of the question. At Shanghai, British and Chinese representatives are in danger of consulting their own interests too closely. With the eyes of the world fixed upon them at The Hague, Great Britain and China both will be measurably forced into viewing the question from the most enlightened standpoint possible. The ultimate rooting up of the drug evil is a certainty. It is only a question of how sharply or how tenderly the problem should be approached.

LAWYERS AND THE PUBLIC.

Several recent addresses before associations of the bar have betokened a stirring of the legal conscience on the question of the lawyer's profession being one peculiarly "affected with a public interest." At the annual meeting of the Pennsylvania Bar Association, one speaker dwelt upon the urgent demand for reforms in the law, and called upon his brethren to see to it that this debt to their profession was discharged in the spirit of a Romilly. Still more pointed was the language used by a member of the Illinois Bar Association. He put these searching questions to his fellows:

> What have the lawyers of Illinois done for the improvement of the administration of justice? What have they done to advance the interests of litigants, to secure justice to poor persons, to expedite the transaction of business, to simplify methods of procedure, or to aid in the proper and prompt enforcement of the criminal laws? Practically nothing.

The obligation is not denied. It presses with singular force upon lawyers, because they are the men who ought to be expert in the matter. They have much more to do than any other class with the enactment of laws. Every Legislature, as well as Congress, has a far larger proportion of lawyers in its membership than of any other group—often, larger than that of all other groups together. To this initial responsibility has to be added the fact that, in the practice and interpretation of the law, in the multiplying of technicalities, the overlaying of statutes with wire-drawn distinctions, the delays of trial, the trying of cases like the playing of a game of skill, rather than as a means of doing substantial justice, the legal profession is most directly concerned. The evils are admitted. Judges dwell upon them. The leaders of the bar call for their correction. Public opinion is urgent for reforms. Yet how little is attempted, much less accomplished.

We would not say that the great body of lawyers are unmindful of their duty to the public in this respect. Yet we think it evident that we have not so many men eminent in the law, as we once had, who are jealous for the standing and usefulness of their profession, swift to condemn abuses, and incessant in efforts to make the law a great instrument of justice. The lawyer-publicist is not so frequent a figure with us as he used to be. This was remarked by Mr. Bryce, when he revisited the country in 1904. In an article giving his impressions of the changes in America since he made his first studies here, he mentioned the diminution, and well-nigh disappearance, of the class of great lawyers who gave of their time and strength not only to legal reform but to the leadership of all good public causes. James C. Carter was preëminently such a man; and it is not invidious to ask what lawyer is to-day in this city filling the void made by his death.

Certain insensible changes in the legal profession have partly accounted for the difference which Mr. Bryce noted. The immense growth of corporations, and the glittering prizes which they have held out to able lawyers, have tended both to specialize and narrow the activity of the leading men at the bar. In their hands, the law has become in a sort commercialized. We use the word in no offensive sense. Legal advice has been necessary to captains of industry. Vast undertakings have needed the skilled service of lawyers at every step of their formation and conduct, with the result that many of the first minds in the law have become rather business men than lawyers. Their range is not so great as that of the older practitioners; it is harder for them to conceive of the law as a whole, and of their profession as one that calls for service of the public, as well as of their clients. It is inevitable, then, that the lawyer as a publicist—we do not say office-holder—should seem to be sinking below our horizon.

It is a loss which is troubling other countries than our own. English jurisprudence is not what thoughtful men feel that it ought to be. In Germany, too, there is uneasiness about the drift in the legal profession. A university professor had an article recently in the *Frankfurter Zeitung*, pointing out the dangers of a too technical attitude on the part of lawyers. According to him, reform should begin in the law-schools. He would have law-students thoroughly grounded in the essential differences between law and justice—*Gesetz* and *Recht*—and trained to think more carefully of their relations to the public. We know, too, that many who are concerned about legal education in our own land, are thinking along the same lines. A high sense of civic duty cannot be directly taught. But the right ideal can be held up, and the inspiring example given. A certain number of men will doubtless always approach the law merely as a means of livelihood—simply an alternative to any other mode of securing bread and butter. And some men can be prevented by no teaching in the law-schools from selling their talents to the highest bidder. But something might be done by professors of law, as

we are aware that numbers of them are fully convinced, by insisting from the first that the lawyer not only has services to offer to individuals, but that he is also a "friend of the court," in the sense of being a lover of justice, and that he should be ever ready to meet a reasonable public demand for improvements in the law, so that its processes may be made speedy, sure, and just.

ANATOLE FRANCE.*

I.

The translation of the works of Anatole France, now proceeding under the editorship of Mr. Frederic Chapman, brings into the ken of English and American readers the most distinguished Frenchman of letters living to-day. We shall await with interest the verdict of the Cisatlantic branch of the Anglo-Saxon court upon his claim to a high rank in international glory. It is not without significance that he comes to us in a somewhat expensive edition limited to five hundred copies. Obviously, his publishers do not expect to win for him at once the popular suffrage. Doubtless, they estimate their public wisely. For M. France comes from the nation most in love with pure ideas to the nation most hostile to them. From a people using speech to reveal thought, he comes to a people using speech to conceal thought. For a mercurial folk of much external sociability he will find us singularly close-mouthed about all our intimate concerns: even when skeptical, reticent about religion; like wild creatures, ashamed of our loves; preferring even to cast a veil of divine illusion over our business enterprises. Partly from habit and partly from a shrewd sense that publicity does not pay, such a book as M. France's recently published "L'Ile des Pingouins" (the translation has not yet appeared) could not possibly originate among us—not because it is bold, but because its boldness comes to nothing serviceable. Those, however, who have a curious desire to know what the world is thinking about in these days, no matter whether it pays or not, are pleased when Anatole France brings out a new book.

II.

Many years ago Jules Lemaître, defining for himself the charm of Anatole France's work, said, "Je sens son œuvre toute pleine de tout ce qui l'a précédé; j'y découvre . . . le plus récent état de conscience où l'humanité soit parvenue." That is, indeed, part of its fascination: it represents in letters what Mona Lisa represents, according to Pater, in art—the "summing up in itself all modes of thought and life." In his books one escapes from the shallow modernity of contemporary literature. He is a cosmopolitan not merely of the present year of grace; he was a citizen of the world before the Christian era. A leisurely aristocrat, polished, imperturbable, he has strolled with ironic smile among the neglected ruins of antiquity. He has discussed Greek philosophy in the Tusculan villa with Cicero, sauntered over the Aventine chatting with Horace, and listened with bowed head while Virgil read to the grief-stricken household his divine praise of the young Marcellus. He observed the strange star in the East, heard the stories of Lazarus and Magdalen, and dined with Pilatus, Procurator of Judea. In the Egyptian desert he occupied a cell with the Christian cenobites; in Alexandria he tasted the last luxuries of the pagan world. He caught from the catacombs the fervent murmur of prayer and the mysterious hymns of martyrs. He saw with a regretful smile nymphs and dryads and fauns at twilight scurrying through the country woodlands in terror of the cathedral bell. A lover of masquerade, he has crept into the cassock of mediæval monks, and gravely announced the performance of miracles, or discoursed upon the lusts of the flesh and the pride of life, or whiled away long hours on a settle in the cloister splitting theological hairs with the church fathers. Especially, he has haunted the steps of the Brides of Christ, irresistibly drawn by the allurement of their celestial roses, hoping, perhaps, to catch a drop of the spilled milk of Paradise. And all this he has told, not as one passing feverishly through successive stages of intellectual intoxication, but as one sitting at his ease and leaning indolently out from a casement in Elysium.

More fascinating than all this selected world-experience is the point of view of the narrator. He keeps us wondering where he is. The detachment of M. France is not that of Flaubert or Maupassant. The realist withdraws a little from his object to gain the proper focus for his microscope. He is nevertheless savagely absorbed in it. He means to bring it home to us, to make us enter into it and feel it tingling in our five senses. M. France, on the other hand, seeks to tranquillize the senses. He contemplates the troubled face of the world through serene leagues of motionless ether. He will report mundane affairs not to the prurient ears of mortals, but to the gods of Epicurus who inhabit the quiet above the clouds and winds, and feel from time to time a mild amusement in the human spectacle. Passing beyond the flaming ramparts of the world, he would enter the celestial hall where the blithe Immortals revel, crying: O Shining Ones, let me, a mortal, share your feast. I have withdrawn my heart and hope from among the miserable race of men. For they come out of the darkness and struggle like beasts in the brief light and go into the darkness again. All their achievements are but as the excellencies of worms differing among one another. They are rent with a love more cruel than the grave. They are burnt in the fire of their own flesh. They are terrified by the shadows which they cast upon eternity. But I have learned the secret of your immortal calm. I have found that there is peace for those content to perceive and not to possess the world. I have learned to look upon the labors of Hercules without desire to lift a finger, upon the temptations of St. Anthony without desire to sin, upon the crucifixion of martyrs without desire to weep. For to the ego wisely isolated from the contagious fevers of existence all these things are but as the fierce vexation of a dream. Make me, therefore, a place beside you, and I will tell you tales of men, provoking supernal smiles.

III.

When M. France, after forty years of philosophical romancing in the garden of Epicurus, published his "Vie de Jeanne d'Arc," the professional historians were shocked and the Epicureans were perplexed. It did not seem quite respectful to the Muse of History, for the author of "Le Lys Rouge" to present her with the life of the virgin of Domrémy. On the other hand, it appeared out of character for the author of "M. Jérôme Coignard" to take the scholarly ideal so seriously. To most of his followers his perilous charm had been that he always seemed to say—Mr. George Santayana has said it, too, in three lines of an admirable sonnet:

> The crown of olive let another wear;
> It is my crown to mock the runner's heat
> With gentle wonder and with laughter sweet.

Nor was it clear what garland a novice of over three-score could hope to win in the trite and well-gleaned field of history where he made his début. To be sure, some critics tried to show that this work did not really represent a new departure in M. France's development; for, they said, even in his romances he had been an historian, as even in his history he had been a romancer. Both views are partly right; the life of Jeanne d'Arc was, in a sense, only the latest in a long series of imaginative saints' lives. But there was a difference. How explain the lengthy preface discussing predecessors, theories of history, original documents? M. France had sent his fine Ariel often enough among ancient libraries, but had never allowed him to appear in the sunlight with dust on his wings. What convic-

**The Works of Anatole France.* New York: John Lane Company.

L'Ile des Pingouins. By Anatole France. Paris: Calmann-Lévy.

tion, slowly formulating, had brought this volant, elusive spirit, this mocking beguiler of an empty day, into step with his sober contemporaries? Let us not attempt to discover, said M. Achille Luchaire, reviewing the first volume of the work, *ne cherchons pas à pénétrer le mystère de cette évolution.*

M. France has something of Prosper Mérimée's repugnance to being divined. On the heels of "Jeanne d'Arc," as if anxious to complicate the chart of his evolution, he sends a satirical afterpiece, "L'Ile des Pingouins," which dissipates in peals of derisive laughter any notion that its author has joined the modern historians. This, too, is a history prefaced by a critical account of sources; but, though shorter, it is much more comprehensive than its forerunner. It is an abridgment of all history that has been or shall be, under the form of a veiled comic history of France. "In spite of the apparent diversity of the amusements which seem to attract me," begins the preface in the old ironical vein, "my life has only one object. It is wholly bent toward the accomplishment of one great design. I am writing the history of the Penguins." In the search for the buried monuments of this people, continues the author, "I excavated by the seashore an unviolated tumulus; I found in it, *according to custom*, stone axes, swords of bronze, Roman coins, and a twenty-sous piece with the head of Louis-Philippe I, King of the French." Embarrassed by difficulties attendant on the interpretation of conflicting evidence, the historian called in counsel several eminent archæologists and palæographers—"They looked at me with a smile of pity which seemed to say: 'Do we write history? Do we attempt to extract from a text, from a document, the least scrap of life or truth? We publish texts pure and simple. We stick to the letter. The letter alone is appreciable and definite. The spirit is not; ideas are crotchets. One must be very presumptuous to write history; one must have imagination.'" A surviving historian of the old school was more encouraging—"Why take the trouble to compose a history when you have only to copy the standard works, as every one does. . . . One word more. If you wish your book to be welcomed, neglect no opportunity to extol the virtues upon which societies are based: devotion to riches, pious sentiments, and especially the resignation of the poor, which is the foundation of order. Assert, sir, that the origins of property, nobility, and gendarmery will be treated in your history with all the respect which these institutions merit. Have it understood that you admit the supernatural when it appears. On that condition you will succeed in good company."—"I have meditated these judicious observations," says M. France demurely, "and have paid good heed to them."

IV.

The narrative, accordingly, begins with the apostolic calling of Saint Maël, his wonderful conversions, his wide wanderings, and finally his voyage in a miraculous stone trough over the turbulent Northern Sea to an undiscovered island. After a detour of the place, the holy man, somewhat advanced in age and understanding, comes upon a circle of penguins. Mistaking them for a primitive heathen people, Saint Maël explains to them successively Adoption, Rebirth, Regeneration, and Illumination, and then in three days and three nights baptizes them all. "When the baptism of the penguins was known in Heaven," proceeds the historian with the suave gravity which heightens the effect of his daring, "it caused there neither joy nor sorrow, but extreme surprise. The Lord himself was embarrassed. He called an assembly of scholars and theologians and asked them if they considered the baptism valid." As the result of a long, hot debate, participated in by Saint Patrick and Saint Catherine, Saint Augustine and Saint Anthony, Tertullian, Orosius, and Saint Gregory of Nazianzen, with interposed questions and objections by the Lord, it was decided that the penguins must be changed into men. And it was done. Thus does M. France admit the supernatural, when it appears! Since Lucian set the infernal gods quarrelling over ferry hire in Hades, dramatized the loves of the Olympians, and represented Zeus, when Timon began to rail, as inquiring casually of Hermes what dirty fellow was bawling from Attica beside Hymettus, no one, perhaps, has dealt so unabashedly with the reigning dynasty of the Heavenly Ones. A late unpersecuted Voltaire—tolerance has made a long march since the eighteenth century—he would gently laugh Jehovah out of Paradise. *Rien n'est plus lâche*, says Pascal, *que de faire le brave contre Dieu.* True, one can fancy Anatole France replying, but see! The walls of chrysoprase, the solemn temples of the twelve-gated city are fast dissolving like an insubstantial pageant of the air. Is it not better to smile than to weep?

With similar fidelity to the instructions of his adviser against disparaging sacred institutions, M. France describes the origins of "property, nobility, and gendarmery." Shortly after the baptism and transformation of the penguins, they begin to clothe themselves, enclose land, and fight. One brains his neighbor with a club; another furious fellow fixes his teeth in the nose of his prostrate adversary; a third brays the head of a woman under an enormous stone. Saint Maël is horrified, but he is assured by a religious brother of wider experience that the penguins are accomplishing the most august of functions—"they are creating law; they are founding property; they are establishing the principles of civilization." All this reminds one of the "Social Contract" and the famous "Discourses" of Rousseau, but it is to be remembered that in the state of nature the penguins were feathered bipeds. No golden age glimmers for Anatole France behind the age of blood. Indeed, in "M. Jérôme Coignard," he has subjected the revolutionary illusions to the most penetrating criticism: "If one is going to take a hand in governing men," he declares, "one must not forget that they are bad monkeys." The history of the penguin nation is the history of half-intelligent beasts—the history of Yahoos and Houyhnhnms. At this point, I cannot forbear quoting the brief, mordant sketch of "Draco the Great," a hero of the Middle Ages:

> He carried fire indifferently over the territory of the enemy and his own domain. And he was wont to say, to explain his conduct: "War without burning is like tripe without mustard; it is insipid." His justice was rigorous. When the peasants whom he had taken prisoners could not pay their ransom, he had them hanged on a tree, and if any unfortunate woman came to beg his mercy on her penniless husband, he dragged her by the hair at the tail of his horse. He lived like a soldier, free from effeminacy (*Il vécut en soldat, sans mollesse*). It is a pleasure to acknowledge that his morals were pure.

Something in that reminds one at the same time of Swift and of Tacitus. If the style is indeed the man himself, there is a tincture of iron in the blood of this Epicure.

There is much piquancy in the contemptuous account of Les Temps Modernes, but one feels the author's point most sharply in the exultant pessimism of his vision of the future. The notion that there is a grim limit set to the evolution of life on our planet has long been dear to the heart of M. France. Long ago he prophetically buried the last desperate relic of our race in the frozen rind of the sunless world. But here he has worked out more fully the stages by which the human tragedy is to decline to the ultimate catastrophe. Before the somewhat remote Last Day there are to be a number of false or temporary endings precipitated by forces at work within the social organism. M. France seems now to have turned his back upon the socialistic hope which he courted a few years ago. To the centralizing tendency of wealth no effective check can be opposed; in the long run, it is as irresistible as gravitation, the rising of sap in forests, the swing of planets in their orbits. But at certain periods when the remorseless oppression of capitalists brings the lower orders to the verge of extinction, they will gain for themselves a dreary

breathing space with dynamite. They will level all populous cities to the dust and incinerate the painfully acquired material and intellectual riches of civilization. For a little while the exhausted survivors will rest, and gasping in dismal anarchy recover their animal strength. Then the old blind urge of life will begin anew; step by step poor posterity will fight its way up the long ascent again; once more the many-storied cities will hum, and lean anæmic millionaires, Pharoahs half-mummified, lord it over the Egyptian millions laying the bricks for their mausoleums. And so the odd wheel of life will turn round and round in concentric circles, ever shortening its diameter, till at last it vanishes in a point, and the barren globe freed of its feverish animalcules journeys on through the void!

V.

"It is the duty of every thinker who has formed an idea of the world," says M. France in one of his essays on contemporary literature, "to express that idea, whatever it may be." If the last chapters of "L'Ile des Pingouins" were a faithful transcript of his sense of the facts of life crowding in upon the sensitive consciousness, we should have deeply to commiserate the author. But the pessimism of M. France is partly polemical. "The spiritualist," Emerson tells us, "finds himself driven to express his faith in a series of skepticisms." M. France began life as a devout humanist, forming his taste and his style on the noblest literature of Greece and Rome. In early manhood, however, he felt powerfully the new hope and enthusiasm of the early followers of Darwin. To the young men of his generation, it was a fresh, firmly-founded revolutionary gospel. But as the century wore on, the scientific millennium receded into the infinitely remote future. To believe in it demanded as pure an exercise of faith as to believe in the New Jerusalem. M. France's faith was unequal to the task. What faith remained in him reverted to his early humanism. Meantime the unreflecting mass of humanity had caught the fanatic fervor of the scientific dream, and had left humanism far in the rear When M. France returned to the temples of his gods he found them empty of worshippers. And so, like most humanists to-day, he is a disheartened humanist. He would, perhaps, have spoken seriously of his faith if he could have found serious listeners. It is rather dreary to praise Pallas Athene in perfect solitude. It is more diverting to steal into the camp of the victors, and mock their cause and insinuate horrible doubt into every heart. Yet by a happy law of the universe only the potential philanthropist can be misanthropic. The Olympian detachment of M. France is illusory. Without a place to stand on, a man can no more despise his fellows than Archimedes could lift the world. So long as M. France despises us, we need not despair; the earth beneath his scornful feet is a part of the common heritage.

I find a still more serious flaw in the would-be seamless garment of M. France's skepticism. He has often assured us that the skeptic is a good citizen, because, uncertain of all things, he is the least radical of men. But the salt of the right skeptic is the love of truth. Whatever enters his head he reports freely, as one holding a commission to act as the disinterested intelligence of mankind, surveying the past and present and spying out the future. That salt was in the virile fibre of Montaigne sitting in his tower in Perigord, cupboarding the choice viands of the ancients and portraying with unflinching hand the manners and mind of the man he knew best. But Anatole France —does he candidly attempt to represent the world as it appears? Does he love truth and the search for truth above all else? As it seems to me, he loves above all else the luxury of philosophic despair. He is a kind of refined, philosophical sentimentalist. With the assiduity of the Graveyard Poets, he cultivates and cherishes those truths, or seeming truths, which make for melancholy. We hear every day: This is the truth; we must face it. The fact is we may usually turn our back upon it, and it is often the part of wisdom to do so. There may be a more wholesome truth at the opposite point of the compass. It is true that when a good man dies he rots like a rascal. It is also true that he lives a fragrant life in the memory of his friends. To embrace the latter truth, strengthens the heart; but a certain kind of sentimentalist always embraces the worm that inherits the shroud. It is the truth; we must face it. But no man can face all truth. We judge a man's wisdom by his power of making intimates of those truths which give channel and speed to the languid, diffusive drift of his days. M. France has sought through all the world for truths inducing in the perceiver a pensive and helpless sadness. M. France is too much concerned about the misery of the last man. If the good die young, as there is some warrant for believing, the last man will deserve hanging.

The skepticism of M. France is largely a literary pose. It is his justification for making capital of all unspeakable things. For a good skeptic he knows altogether too much about the future. When a man's philosophy has carried him to the point where several million years of civilization are as to-morrow, are as nothing, to him, it is a pity that it should not go a step further to the point where space vanishes and time expires and the illusive ages evaporate into the eternity of the everlasting Now. For a good skeptic he is altogether too sure that the world has exhausted its possibilities. He holds, indeed, that we live in a bright-flowing mist of days and nights, of sleeping and waking dreams. But he does not hold this belief with strength enough to be dumb and astonished at thought of the germs of new orders of ideas now forming in society or slumbering as yet unstirred in the unused mind of the world. He does not recognize as frankly as a skeptic should how plastic is the eternal flux under the creative urgency of the desire of man, who had only to say, "Let the flux be peopled with demons and with seraphim," and it was. Only the new-born babe enjoys, however, that purity of uncertainty to which M. France pretends. And as soon as the babe first sniffs the vital air, it is a judge as well as an observer. It discovers at once that for the present at least some things are good and beautiful, and others terrible and necessary.

STUART P. SHERMAN.

Correspondence.

FROM LOMBROSO TO SHAKESPEARE.

TO THE EDITOR OF THE NATION:

SIR: The conviction that the Shakespeare-Bacon controversy was after all confined to a narrow circle of scholars never forced itself so strongly upon me as when I took up other recent writings on Shakespeare, the authors of which succeed in finding new and living material for modern study in the familiar dramas. Among such books is August Goll's "Criminal Types in Shakespeare" ("Forbrydertyper hos Shakespeare," Gyldendal, Copenhagen, 1908). The author, a Danish police inspector, presents Shakespeare in a new light, as a criminologist. Much has been written of Shakespeare as a psychologist, but his value to the student of crime has only recently been discovered. It is not my intention to review Goll's book. I want rather to make clear how it came to be written, and hope that the explanation will prove interesting to the Shakespeare scholar and the student of criminology alike.

Goll wrote his book because the present state of criminal psychology filled him with despair. At one time he marched in the ranks of those enthusiasts who flocked about Lombroso and his school, and like him he saw in the criminal a species of humanity, a particular genus in the zoological group *homo sapiens*. He swore like him by the impossibility of deception in innumerable measurings and weighings, by the many deviations from the normal which characterize the criminal. But, again, he was one of the first to see that though Lombroso's characteristic marks undoubtedly do fit a small group of degenerate criminals who are closely related to the weak-minded and insane, there are many cases which they do not fit at all. He was obliged to acknowledge that criminals themselves do not differ materially in their thoughts, feelings, and will from others. He could not fail to see that a particular

psychology did not even fit a particular group of criminals, that the same crime may be committed from absolutely different motives, while it is purely dependent on circumstances what will be the crime of a passionate or crafty character.

We are all being forced to the conclusion, as was Herr Goll, that it would be better for criminal psychology if criminalists, instead of pointing out artificial similarities among all criminals, would show us real differences between individual criminals. It would be of greater value if they would collect single observations and experiences and present them in an objective form, so that the master-mind that will come some day may find sufficient material at hand to be able to construct out of all these details a plastic whole.

Actuated by this hope criminalists all over the world are beginning to collect accounts of peculiar criminal careers and medical examinations of criminals. These studies have already shown how short-sighted we were till within the last few years. They prove that the former classification, according to the kind of *crime*, only leads to confusion, that the *criminal* is the point to consider in all classifications. It must not be forgotten that all these examinations are of criminals in prison or on trial. But that the criminal in prison is not a trustworthy source of information about the criminal at large is clear even to the layman.

It is therefore only natural that we should try to supplement what we learn from a direct source of information by what we learn from an indirect source, that we should turn from reality to its reflection—from life to literature. Of course we must first choose carefully the kind of literature that has real bearing on the subject, for there is a literature about crime and a literature about criminals.

To the first belongs the real detective story. However exciting a tale of Conan Doyle, for instance, may be, it is always the crime and not the criminal that interests the author and the reader.

Then, too, the real criminal literature, of which criminals themselves are the authors, is of very little value to the criminalist. Several criminals have appeared in literature, as, for instance, the Marquis de Sade, Casanova, Cellini, Villon, Harry Orchard, etc. We might also include some poems of the greatest French lyric poet of the last fifty years, Paul Verlaine. Lombroso and his school collected hundreds of poems, proverbs, etc., by all kinds of criminals. But it is just this criminal literature that shows how little we can believe the criminal. At best he is able to reveal only what he has retained of ordinary human feelings.

Another sort of literature is written by people who have associated with criminals in a friendly way, like Josiah Flynt, and Hans Leuss. But these books, valuable though they often are, enter only into the criminal's opinions of justice and how he escapes it. Besides, their aim is generally to agitate and make a sensation.

There remain only the great poets. These lay the criminal's soul open like a book. They show us the birth of the motive, the nervous strain that develops with it, the consideration of the kind of crime, the gradual growth of the determination and the execution, the mental moods during and after the deed. They follow the criminal through love and hate, storm and calm, not merely as spectators and critics, but as if in the person of the criminal himself, as one who sees deeper than any criminal can. To them the criminal psychologists should turn with confidence. In our day, Dostoevsky has described criminal individuals in his "Raskolnikov" and in "Memoirs from a Death House," as prison governors and criminal psychologists have tried in vain to describe them. Above him, the greatest Slav, stands the greatest Teuton, Shakespeare. Goll thinks that in studying Shakespeare's criminals we come as near as possible to the ideal of "seeing the criminal in the man, the man in the criminal."

He sees in Caliban the congenital criminal, the creature with the purely anti-social nature whom Prospero tries to reform. Prospero gives him shelter——he makes use of it to attempt rape. Prospero teaches him the power of language—he uses it to curse. Prospero teaches him the faculty of thought—he uses it to ponder on evil schemes. He loves but one thing, spirits; and fears but one, punishment. He is capable only of the lowest kind of work, and has to be forced to do that.

From this primitive criminal, Goll leads us on up to the political criminal, to hate-filled Brutus and the doctrinarian Cassius. Naturally enough, he finds but little new to say about Richard the Third; his analysis of Iago, on the other hand, is masterly. He lays bare the erotic side of Iago's hatred of Othello—his "instinct of erotic cruelty," as the criminalists now call it. Iago's speeches are all embittered by sexual insinuations. He sees in others only the expression of coarse, sexual motives, the best sign that they alone underlie his own actions. He finds satisfaction in poisoning Othello's enjoyment of Desdemona's love, and takes pleasure in seeing her martyred, first her soul, then her body.

However, as I have said, these lines are not intended to follow the ingenious author through his analysis of all Shakespeare's criminals. The book is strong enough to speak for itself. My purpose is only to show what undiscovered treasures still lie in Shakespeare, treasures which, to me at least, are infinitely more interesting than all the acrostics that patient searching might reveal.

ADALBERT ALBRECHT.

Boston, July 23.

CROMWELL AND AMERICA.

To the Editor of The Nation:

Sir: The yet unsettled historical question whether John Hampden, Oliver Cromwell, and Arthur Haselrigge had taken their passages for New England in 1638, might well be revised, in view of certain entries that appear in the recently published "Acts of the Privy Council, 1613, 1680."

It will be remembered that Neale, in his "History of the Puritans" (vol. I, p. 618), says:

> It deserves a particular notice that there were eight sail of ships at once, this spring, in the river Thames, bound for New England, and filled with Puritan families, among whom (if we may believe Dr. George Bates and Mr. Dugdale, two famous Royalists) were Oliver Cromwell, afterward Protector of the Commonwealth of England, John Hampden, Esq., and Mr. Arthur Haselrigge, who, seeing no end of the oppressions of their native country, determined to spend the remainder of their days in America; but the Council, being informed of their design, issued out an order, dated May 1st, 1638, to make stay of those ships and to put on shore all the provisions intended for the voyage.

Excepting that the dates do not exactly agree, the following order of the 30th of March, 1638, confirms the foregoing statement, as to the stay of the ships and the relanding of the passengers and provisions:

> Whitehall, 30th March.
>
> It was this day ordered for reasons importing the State, best known unto theire Lordshipps: That the Lord Treasurer of England shall take speedy and effectual order, for the stay of eight shipps now on the River of Thames, prepared to go for New England: And shall lykewise give order for the putting on land, of all the Passengers and provisions therein intended for that voyage.

On the 6th of April, upon the humble petition of the merchants, passengers, and owners of ships bound for New England, the restraint was removed, and the passengers were allowed to proceed on their voyage. At the same time, owing to frequent resort to New England of persons ill-affected to church and government, it was decided that a Proclamation should be issued prohibiting passengers being taken to New England unless they had first obtained special license on that behalf from the Lords of the Council for Plantations.

A search for the petitions of the passengers has been made among the Privy Council records, but without result. As Archbishop Laud was present at both the meetings of the Council, it is possible that the documents may be among the papers preserved in the Library at Lambeth.

That Cromwell did contemplate leaving Old England, in 1641, is recorded in Clarendon's "History of the Revolution" (vol. I, p. 312) where that stanch Royalist states that after the debate in the commons, Cromwell whispered Falkland "in the ear," as the two were leaving the House, that

> if his Remonstrance had been rejected, he would have sold all he had, the next morning, and never have seen England more; and he knew there were many other honest men of the same resolution.

Clarendon further tells us (vol. I, p. 377), that, until the King revived their courage, by his demand for the five members of the House of Commons, "some of them had resumed their old resolutions of leaving the Kingdom." These last words show that the idea of emigrating was not a new one.

N. DARNELL DAVIS.

Bathsheba, Barbados, June 24.

RELIGIOUS AUTHORITY IN TURKEY AND PERSIA.

To the Editor of The Nation:

Sir: In an editorial in the *Nation* of July 15, there is a sentence which may lead to misunderstanding. 'You say, foot of last column of p. 45: "Once more it was shown that the religious authority of Sultan or Shah was no very terrible weapon, after all."

The Shah of Persia has no religious authority and stands, in that respect, in an absolutely different position from the Sul-

tan of the Ottoman Turks. He is a mere *locum tenens* and maintainer of public order until the Hidden Imam, the divinely appointed and guided Head of the Shi'ite world, returns from his century-long banishment. In the meantime the Mujtahids, the Shi'ite clergy, are the representatives of that Imam in spiritual things, and they form practically an ultimate court of appeal. Their "excommunication" of the Shah can mean only a declaration on their part that he has violated essential elements of Islam and is no longer fit to be a ruler of any kind.

The Ottoman Sultan, on the other hand, has religious authority, as he claims to be the Khalifa or successor of the Prophet, the spiritual head of the Moslem world. To enter upon the grounds of that claim and the extent to which it is admitted would take too much of your space. But there is one thing above even the Sultan-Khalifa, and that is the Moslem people itself. If he violates essential elements of Islam, the people have a full constitutional right to depose him; the democratic basis of Moslem government has never entirely vanished—it only makes use of an autocratic executive. In Turkey this popular will is supposed to be expressed through the Shaikh al-Islam, the head of all the Ulama, the canon lawyers, and theologians. They and he represent the people, while in Persia the Mujtahids represent the Hidden Imam. Thus the deposition of Abd el-Hamid was carried out strictly according to constitutional law, and that law affected him both as Sultan and as Khalifa.

DUNCAN B. MACDONALD.

Hartford, Conn., July 15.

TEACHERS OF ADVANCED MATHEMATICS.

TO THE EDITOR OF THE NATION:

SIR: It is a generally unknown fact, but one that should be of interest both to the public and especially to students of mathematical bent, that at present the demand for teachers of advanced mathematics distinctly exceeds the supply. In support of the statement that such an excess exists I may cite the fact that one Eastern university professor, though in no way connected with any teachers' agency, has, within the last three months, received from widely distributed sections of the country no less than a score of requests for nominations for mathematical teacherships, ranging in grade from instructorships in technological schools to university professorships; and that, though the professor referred to has an extensive acquaintance among teachers and advanced students of mathematics, he was far from able to meet all the requests. It is fair to assume that other professors of mathematics have had a similar experience.

CASSIUS J. KEYSER.

New York, July 22.

HANGING ANIMALS.

TO THE EDITOR OF THE NATION:

SIR: Does not the proverb, "Give a dog a bad name and hang him," at least imply that the trial and execution of animals was once a matter of popular knowledge, if not of popular experience? Scott, also, seemed to think that the matter required no explanation when, in "The Talisman," Chapter xxiv, he has Henry of Champagne exclaim, "It were well to hang up the dog, and put the slave to the torture."

R. P. UTTER.

Amherst, Mass., July 22.

Notes.

Mrs. Lecky has written a life of her husband, W. E. H. Lecky, which will be published by Longmans, Green & Co. in the autumn.

The first volume of Gustavus Myers's "History of the Great American Fortunes" will be published in September by Charles H. Kerr & Co. The second and third volumes, completing the work, will be issued as soon after that date as possible.

It gives us pleasure to note that a bust of that excellent Manx poet and letter-writer, T. E. Brown, has been unveiled at Douglas, on the Isle of Man. The bust is the work of a Manx sculptor, Mr. J. W. Swynnerton.

Those who are mildly interested in the period of Queen Anne will be entertained and instructed by Lawrence Lewis's little book on "The Advertisements of the *Spectator*: Being a study of the Literature, History and Manners of Queen Anne's England as they are reflected therein, as well as an illustration of the Origins of Advertising" (Houghton Mifflin Co.). It serves as a very fair substitute, so far as the advertisements are concerned, for the rare original sheets of the *Spectator*, and conveniently classifies its illustrations of Queen Anne lotteries, costumes, dancing-schools, theatres, and much more. Even careful students of the period will profit by the second chapter, the conclusions of which are important and well founded. But, pleasantly as Mr. Lewis fulfils the promise of his sub-title, the value of his book would be considerably greater had he not seen fit to isolate the *Spectator* from its predecessors and contemporaries. It is particularly to be regretted that he has neglected the *Tatler*, which serves even better than the *Spectator* to answer some of the problems that beset a student of the Queen Anne periodical considered as a business enterprise. A thorough study of the advertisements in the *Tatler*, for instance, would certainly modify the impression that the *Spectator* is of paramount importance as an illustration of the origins of advertising.

A faint Browning Club aroma hangs about "Utopian Papers" (London: Masters & Co.), a collection of discourses and essays edited by Dorothea Hollins. Patrick Geddes is the only well-known name among the half-score contributors to this gentle, amateurish volume of reflections on things as they are not. So far as an outsider may gather from the rather esoteric style of the editor, the Utopians are a group of London residents interested in ideals, who meet frequently for the interchange of thought and sometimes find the result good enough to print. A paper on Chelsea, Past and Possible, is followed by one on Utopia's Past and Present, and another on the Utopian Imagination. But we get rather far away from our subject when it comes to a study of St. Columba, or Goethe, or Indian Thought. It is characteristic of nearly all ideal world-builders that they deal with the concrete and the commonplace. What the authority of husband over wife will be, how many hours a day children will pass in school, the number of people to a table at the public mess, and the color and texture of the garment reserved for magistrates, predominate over detail of spirit and mind. No such precision marks the present volume whose right to the adjective Utopian is partly justified by the fact that it gets nowhere in particular.

The nineteenth volume of "Harvard Studies in Classical Philology" (Harvard University, 1908) contains as its leading article a discussion by the late Louis Dyer of "The Olympian Council House and Council," in which he defends against J. G. Frazer the current identification of certain remains as those of its foundations, uses them as evidence to prove the hitherto unsuspected existence at Olympia of a pre-Dorian Amphictyonic League, and then elucidates certain points in the history of the council. In the following articles, Joseph W. Hewitt examines the worship of Zeus under various surnames, and shows that this bright-sky deity's cult was extended by conquest among peoples who had worshipped chthonic deities, with whom Zeus became more or less identified; Sereno B. Clark decides from metrical considerations that the "double letters" in the "Heroides" were written by Ovid, but at an undeterminable date; and William H. P. Hatch makes a lexicographical study of a group of Greek words of religious significance during the period as far down as 300 B. C. The studies as a whole are respectable rather than brilliant, but that by Mr. Dyer will be likely to provoke more than passing comment among students of Peloponnesian history.

In view of the leisurely fashion in which most of the calendars of English state papers drag forward, William Foster is to be commended for the dispatch with which he has brought out within a year another volume of "The English Factories in India" (Henry Frowde). In the period covered by this third volume, 1624-1629, the English trade improved considerably, in spite of the difficulty of raising capital at home. Indian calicoes began to be heavily imported, so that, whereas the English had formerly paid the foreigner £500,000 per annum for hollands, lawns and cambrics, they were now able to save more than half that sum, and began even to vend their calicoes from India in foreign parts. The rivalry of the English and the Dutch still caused bitterness in the Far East around Batavia; but in the West, from Surat to the Persian Gulf, where they met the hateful competition of the Catholic Portuguese, the English reported that the Dutch agreed to "sticke as close unto us as the sherts one our backs, wee promisinge the like unto them." Together they fought many a good fight against the Portuguese, and showed that the spirit of Drake and Hawkins and the Sea-Beggars of an earlier generation had not departed. In view of the later greatness of Bombay, it is interesting to note that as early as 1626 the English cast their eye upon it as a place of "noe ill ayre, but a pleasant, fruitful soile and excellent harbor"; a mate made a sketch of the bu which is here reproduced as the frontis-

piece. No settlement, however, was made at this time, as the place was too exposed to Portuguese depredations. Of the 366 documents calendared with discrimination and indexed with care in this volume, a majority deal with the activities of the company on the west coast of India, some tell of the attempts to secure more trade on the east coast, near Madras, and of the failures of the English in the Far East; and others give much valuable information in regard to important events in the internal history of the Mogul Empire.

"Our Foreign Service—the 'A B C' of American Diplomacy," by Frederick Van Dyne (The Lawyers Coöperative Publishing Company, Rochester, N. Y.), is a systematic account of the organization and duties of our diplomatic and consular service. It is purely expository, and it includes a bibliography of the subject, statements of legal form, and a complete schedule of the consular service. The work appears to have been executed in a thorough and painstaking manner.

"The Federal Civil Service as a Career," by El Bie K. Foltz (G. P. Putnam's Sons), is evidently the outcome of the growing disposition to regard public service as a professional career, and to prepare for it as such. The book is offered as a manual for applicants for positions in the civil service and for those already in who desire to improve their qualifications. The style is marred by journalistic fustian, as, for example: "So voracious is the American appetite for gold that the money devil seems to have gotten his fangs into many of our university men." The book contains useful information, and seems to be based upon a careful study of routine detail.

The latest addition to the excellent Manuali Hoepli, issued by Ulrico Hoepli, in Milan, is "Le rovine del Palatino," by Dominico Canogni, a leading authority in the archæology and history of Rome. It is richly illustrated and contains a good plan of the Mons Palatinus.

The theory that Von Kleist was anything but a physical degenerate and one mentally unbalanced, will be rather startling to many, but it is the basis of S. Rahmer's new work, "Heinrich von Kleist als Mensch und Denker," a volume of 433 pages, with two portraits, published at Berlin by George Reimer. After wrestling some years with the "Kleist Problem," Rahmer concluded that more than one accepted theory about the poet was false—that, for example, instead of being a recluse and morose by nature, he had in reality a good deal to do with men and affairs of his time, as is proved by his correspondence and his works. Examination of the Von Kleist archives brought disappointment, but a search for other contemporary evidence led to the discovery of much material concerning Zschokke, Varnhagen, and others, hitherto quite unknown. With a scientific preference for the truth, however, Herr Rahmer admits that he has not yet been able to get as much support for his theory as he wished or expected.

In three volumes Dr. Johann Friedrich von Schulte presents his Reminiscences as a jurist and teacher, and one long active in public life in Germany (Giessen: Emil Roth). The third volume is particularly interesting to foreigners on account of several essays setting forth Germany's relations to the Vatican and the author's recollections of Bismarck.

Prof. P. Jensen of the University of Marburg has evidently been dissatisfied with the reception accorded by philologians and theologians to his great work of more than a thousand pages issued two years ago under the title of "Das Gilgamesch Epos und die Weltliteratur," in which he undertook to show that the bulk of old Testament narratives, especially the personal, as also the doings of Jesus, are really adaptations from the data found in the famous Babylonian Epic of Gilgamesh. He now brings out a smaller work, indeed only a good-sized brochure, entitled "Moses, Jesus, Paulus: Drei Sagenvarianten des babylonischen Gottmenschen Gilgamesch," with the significant sub-title "Eine Anklage wider Theologen und Sophisten und ein Appell an die Laien" (Frankfurt a. M., Neuer Frankfurter Verlag). The new feature of this argument is that the Apostle Paul is also made a reflection and reproduction of episodes and characters in the Gilgamesh Epic. It must be acknowledged that Jensen, who is an able Assyriologist, has found a number of striking parallels between Paul and Gilgamesh, which are all the more noteworthy because they are not the expression of religious beliefs or feelings common to all men, but of historical facts and events in the lives of these two personages. The weakness of his method is that he does not and cannot show any inner connection between these phenomena that externally look so much alike. It is the old fallacy of *post hoc ergo propter hoc.*

The first part of the fifth volume of Nietzsche's correspondence, edited by Elizabeth Förster-Nietzsche, has appeared from the press of the Insel Verlag, Leipzig, under the title "Friedrich Nietzsche's Briefe an Mutter und Schwester." The letters were written chiefly between 1856 and 1889, but the entire period is not covered, probably because Nietzsche was several times at home and long in such close personal association with his relatives that letter writing was unusual. Much of this new correspondence is very personal, and the reasons offered for putting it into type are the continued attacks on Nietzsche's memory, and the demand of his admirers for more light on the inner mind of the mysterious thinker. The letters naturally include Nietzsche's spiteful criticism of Frau Lou Andreas-Salomé and Dr. Paul Rée, whom the philosopher relied upon for certain scientific coöperation, and with whom, when they failed him, he dealt so severely that they are likely to enjoy a certain unwelcome immortality. To remove somewhat the bitterness of this unhappy experience, the editor seeks to show that Nietzsche criticised Rée and Salomé as a matter of principle, rather than through personal hatred.

A young Danish philologist, Hans Brix, has recently, through the Schubotheske publishing firm (represented in America by the Gyldendal Publishing House, Chicago), under the title "Fagre Ord" (Words of Beauty), given to the public an interpretation of a number of the most famous Danish lyrics, beginning with the national anthem. The application of philological methods to the interpretation of modern lyrics is a matter of such rare occurrence that any serious attempt in that line is bound to be interesting. Mr. Brix succeeds, even in regard to the national song itself, in dispelling misunderstandings and throwing light on passages, which, it can be taken for granted, up to this time not one out of a hundred Danes understand correctly.

H. Ascheboug & Co. of Christiania have just sent out the last (sixteenth) fascicle of the Danish-Norwegian dictionary (Dansk-Norsk Ordbok), prepared by S. Schjött and published, in part, at public expense. Danish-Norwegian in this case means from Danish into Norwegian, *i. e.*, a dictionary of the Danish language giving the Norwegian (*landsmaal*) equivalents. Under a Norwegian law passed three years ago, it will be compulsory two years from now for all those who desire to be matriculated in the university (or, as they say in Norway, pass the *examen artium*) to prove their ability to write, not only the usual city, or book language, but also the so-called *landsmaal*, a kind of common denominator of the different country dialects. While the main stock of the regular written language is of Danish origin, the Danish influence on the country dialects has been relatively slight, and the *landsmaal*, which, therefore, is essentially Norwegian in character, has, of late made such progress as a medium of instruction in the public schools that some of the partisans of the essentially Danish *rigsmaal* or *kulturmaal*—which itself, of late, by a spelling reform, imposed by the Michelsen ministry on the schools and all public institutions, has been greatly Norwegianized—have taken fright and formed *rigsmaal* associations. The novelist Björnson has been one of the leaders of this movement, and it is likely that the intense interest taken by him in this question has helped to bring about the illness from which he is now suffering. Schjött's dictionary will be of interest not only to Norwegian students and teachers but to everybody interested in Scandinavian studies.

After an illness of some days the Rev. Dr. William Reed Huntington, the well-known rector of Grace Episcopal Church, New York, died last Monday, at Nahant, in his seventy-first year. Dr. Huntington was an active worker in the church, but found time also to write a number of books, including: "The Church Idea," "Conditional Immortality," "Popular Misconceptions of the Episcopal Church," "The Causes of the Soul," "The Peace of the Church," "Short History of the Book of Common Prayer," "The Spiritual House," "A National Church," "Psyche, a Study of the Soul," "Four Key Words of Religion," "Sonnets and a Dream," and "A Good Shepherd and Other Sermons."

Hans Hoffmann, the German novelist, has died at Weimar, in his sixty-first year. Among his stories are "Brigitta von Wisby," "Im Land der Phäaken," "Vom Lebenswege," "Ostseemärchen," "Landsturm," and "Von Haff und Hafen."

Baron Detlev Axel Adolph Liliencron, the German poet, died July 22, at the age of sixty-five. Besides his books of verse, he wrote several novels depicting military life.

From Breslau comes the report of the death of Dr. Emil Bohn, professor of the History of Music in the university of that place. Among his books are "Bibliographie der Musik in der Breslauer Bibliothek," and

"Die musikalische Handschriften in der Stadtbibliothek Breslau."

News comes of the death of Samuel Martin Deutsch, professor of theology in the University of Berlin, in his seventy-third year. His published works include "Die Lehre des Ambrosius von Sünde und Sündentilgung," "Drei Aktenstücke zur Geschichte des Donatismus," "Synode zu Sens 1141 und die Verurteilung Abälards," and "Peter Hagenbach."

THE AUTHORITATIVE LIFE OF POE.

The Life of Edgar Allan Poe, Personal and Literary; with his Chief Correspondence with Men of Letters. By George E. Woodberry. Boston: Houghton Mifflin Co. 2 vols. 12mo. Pp. xii, 383; viii, 481. With illustrations. $5 net.

The appearance of these volumes is the most important event connected with the centenary of Poe. We might go farther and say that the present work is the chief biographical contribution yet made to Poe studies, but for the fact that the same author's monograph on Poe in the American Men of Letters may fairly be held to have laid the foundation for critical as opposed to partisan and amateur study of Poe's life and writings, and, in consequence, to have shaped, or at least influenced, most of the subsequent Poe literature that has any value. It is not likely, of course, that biographies of Poe will cease to appear, or that Mr. Woodberry, judicial and sanely sympathetic though he be, will be chosen—to his own chagrin—moderator of those unseemly wranglers, the Poeites and the Anti-Poeites. But it is likely that no large amount of new biographical detail calculated to affect our judgment of Poe awaits incorporation in a future book, and it is almost certain that better-informed, more impartially balanced, and more discreetly appreciative criticism of Poe's writings in their entirety is not to be looked for in our generation. Here and there an illuminating fact will doubtless come to light; we shall occasionally be led to shift an emphasis, to modify an inference; it will become less and less difficult to form a composite conception of Poe the gentleman and Poe the outcast, of Poe the true artist in verse and prose, and Poe the hack writer who took up his abode now and then in the purlieus of charlatanism; but our approaches to a more adequate and sympathetic understanding of what Poe was and did will be made along the lines of painstaking study, as opposed to hero-worship and demon-exorcism, first consistently and effectively followed by Mr. Woodberry.

The genesis of the volumes is succinctly described in their preface. Mr. Woodberry was joint editor of R. W. Griswold's papers relating to Poe, and he also edited the Poe-Chivers papers. Much information came to him from other sources—particularly, one may gather, from persons who contributed Poeana to the newspapers. It seemed desirable, therefore, for him to gather up his "earlier and later labors in a more full and precise biography" than his monograph of nearly a quarter of a century ago. He admits that during this period he did not engage "in personal investigation"—the failure to date some of the newspaper clippings utilized seems to be evidence of this fact—and he expresses the modest conviction that he has at least "made easier the way" for the ideal biographer.

Our opinion upon this point has already been given; another point made in the preface demands a word. Mr. Woodberry tells us that he has "aimed to make this, in the main, a literary biography," that "as such it has two special interests, in that it is a life led outside of New England," and that "it embodies much contemporaneous literary history not involved in any other life of our greater writers." Against these statements no caveat need be entered, but it seems fair to say, in the interest of the general reader who happens not to care greatly for Poe or for the American literature of Poe's period produced outside of New England—much more in the interest of the unpatriotic soul whose reading is not prevailingly confined to the writings of his own countrymen—that Poe and most of his correspondents were not great letter-writers, that it is a petty and often ignoble world which is evoked for our contemplation, and that such persons as distrust their powers of literary assimilation may legitimately hesitate before settling themselves to the task of reading through these more than eight hundred pages. There are doubtless readers who would find more pleasure and profit in Professor Woodberry's earlier biography than in this fuller work, which suffers from the defects of its qualities.

The undaunted reader of the present book, however, will get for his pains almost everything to be found in the earlier, for the criticism has been transferred bodily—at least to all intents—and a large part of the biographical narrative proper has been utilized unchanged. The expanding and the redistributing of material have been accomplished with quite exceptional skill, and we found the book readable from preface to index, not excepting the notes on obscure points with which each volume concludes.

The first chapter and the two opening notes show how carefully Mr. Woodberry's original investigations were made, and how completely unaffected they remain by recent attempts to deprive Boston of the little-prized honor of being Poe's birthplace. The details added with regard to Poe's school and college days need no comment, but a slight change made in the brief account of the publication of "Tamerlane and Other Poems" should not be overlooked. In his earlier work (p. 36), Mr. Woodberry drew from insufficient premises the conclusion that Poe lived in Boston in the spring of 1829, under an assumed name. In the new book, this inference is omitted, and the change is an indication not only of the care, but of the spirit of justice that has been manifested throughout the revision.

The fourth chapter deals with Poe's life in Baltimore, after he left West Point, and adds something to our knowledge of that mysterious period. Time will show whether more light can be thrown on these years, which are specially important, not only in the evolution of Poe's imagination, but in the development of his unfortunate habits and of his defects of body and mind. With regard to the relations sustained by Poe to the Allan family, and to the improbable charge of forgery brought against him—a charge ignored in the earlier biography—Mr. Woodberry gives an interesting note, which brings out the fact, not widely known, that there are Poe papers of presumable importance deposited in the Valentine Museum at Richmond, Virginia. They were placed there by the family of the first Mrs. Allan, and Mr. Woodberry is ignorant of their contents, having with uncommon discretion forborne to ask for a sight of documents not proffered to him. As twenty-five years have now gone by, it is much to be hoped that these papers, which may be the only means by which the scandalous tongue of tradition can be stopped, will be published speedily, and in their entirety. If they reveal nothing, the case for Poe will be helped by that fact. If they reveal unknown faults and misfortunes, we shall have all the more reason to emphasize Poe's subsequent efforts at reform and his hard-won triumphs as a writer.

It is in the fourth chapter that Poe first comes fairly before us as a correspondent—a fact which makes it necessary to recall the biography and the volume of correspondence prepared by Prof. James A. Harrison for the "Virginia Poe." The letter of May 30, 1835, from Poe to T. W. White of the *Southern Literary Messenger*, inserted by Mr. Woodberry (II. 110-113) is also printed by Professor Harrison (XVII, 4-6). Both give credit to the Griswold Papers, hence one scarcely expects to find about twenty-five small variations in punctuation, capitalization, paragraphing, etc. On making further comparisons, we were led to believe that Mr. Woodberry had the service of a better copyist than fell to Professor Harrison's lot, but that, in the main, it is a matter of indifference whether one quotes Poe and his correspondents through the medium of the present work or through that of

the "Virginia Poe." Still, we should have been glad of a note on the subject of the text of the letters, particularly on that of the despairing appeal made by Poe to J. P. Kennedy on Sept. 11, 1835. Mr. Woodberry credits his text to the "Kennedy Manuscripts" (II, 138-141); Professor Harrison credits his to the "Griswold Collection" (XVII, 16-18). There are about thirty variations, some of which would be of the slightest importance, but for the fact that this letter nas been subjected to close analysis, in order that light might be thrown by it upon Poe's mental condition. We have known it to be used as evidence that he was under the influence of opium when he wrote it. If such uses are to be made of letters, it is desirable to secure absolute accuracy. A profusion of correctly inserted commas might lead to a verdict of "not guilty"; an abundance of misplaced dashes to a less favorable one. Our personal interest in this matter is of the slightest, but, if we stand upon the threshold of an Alexandrian period of our literature, it is surely time to safeguard the students of the future. We must settle our texts. Imagine the weary hours some yet unborn commentator will spend, endeavoring to determine whether Emerson employed a comma after some particularly orphic word, or whether Whitman separated two items in one of his catalogues with a dash or a semi-colon. If we will have cults, we and posterity must pay the penalty.

Passing rapidly to the end of the first volume, we note that Mr. Woodberry prints several letters which either are not given by Professor Harrison or else are synopsized. This continues to be true throughout the first half of the second volume, and it is a fact that adds considerably to the value of the present biography. The correspondence as given in the "Virginia Poe," however, is fuller and indispensable, and occasionally it might have been well for Mr. Woodberry to consult it carefully. For example, the phrase "morbid sociability," which he queries as used by F. W. Thomas (II, 16), appears in the Virginia text, "morbid sensibility" (XVII, 137). A few pages farther he would have found a letter which the Virginia editor presents as written by Poe to James T. Fields, an epistle which Mr. Woodberry is apparently correct in assigning to the Poe-Lowell correspondence. Was it magnanimity or oversight that was responsible for the fact that no note is given calling attention to the error? However this question may be answered, there can be no doubt that Mr. Woodberry is both careful and magnanimous in the way he substantiates an account of the sole interview between Poe and Lowell given in the earlier biography, and called in question by Professor Harrison. The latter had written:

> That Mrs. Clemm, Poe's guardian-angel, the one woman in all the world most anxious to shield her nephew and son-in-law's reputation from the cruel criticism of strangers, should confess to the stranger Briggs that he was "tipsy" is altogether incredible, and rests only on the unauthenticated testimony of a man who was now Poe's professed enemy (the "Virginia Poe," I, 204).

Mr. Woodberry, in reply, leaves Briggs to take care of himself, but prints Mrs. Clemm's letter to Lowell of nearly five years later, in which she not only showed that her memory was good, but actually used the words, "The day you saw him in New York *he was not himself.*"

This matter is not so trivial as it seems. It is a thousand pities that Poe's frailties have been exploited in such a fashion that they cannot be overlooked or forgotten; but this is quite as much due to the indiscreet zeal of his admirers as to the putative ghoul-like instincts of Griswold and his successors. The facts had to be told, and, that being true, it is salutary and comfortable to find them prevailing over rhetorical sentiment. No admirer of Poe's genius need have any quarrel with the revelations made in this book. What we should set our faces against, is incompetent censoriousness, fatuous eulogy, and impertinent intermeddling in literary matters by untrained persons.

In his discussion of Poe's relations with women after his wife's death, and of the wretched tragedy at Baltimore, Mr. Woodberry seems to us to have presented as full and accurate a statement of the facts as is possible, and to have accomplished his difficult task with extraordinary tact. In his appendix, among other items, he gives letters from Lowell to Briggs, some unpublished correspondence of Poe, an excellent discussion of "Poe and Chivers" and a just account of "Griswold's World." The notes are valuable, and the index seems to be ample and careful. It is almost needless to add that but few misprints have been discovered. A Mr. Pleasants has lost the final s of his name, and John M. Daniel, the once famous editor of the Richmond *Examiner*, has been allotted one to which he has no claim. These trifles, with an obvious slip in a date (11, 113, *note* 2), are all that we have noted.

CURRENT FICTION.

Partners Three. By Victor Mapes. New York: Frederick A. Stokes Co.

From the absurd cover, with its crude three-in-a-row pattern, which encloses this narrative, and from the situation with which it opens, the reader may be led to expect a not unfamiliar type of criminal-mystery tale, with a more or less perfunctory "love-interest" thrown in. Crime it does undeniably contain, but not of that frightful mien in which the moralist exults, or used to exult. "Yesterday," begins the story-teller, "was the second anniversary of my arrival here in a cell at Sing Sing." The reader at once, as if automatically, begins to speculate as to whether safe-cracking, diamond-theft, or murder is to be the motive of the yarn to follow. But the ensuing statement turns out to be no less true than remarkable: "How I came to be brought here, what crime I committed, how I was caught and tried, are matters which have very little to do with the story I am starting out to tell." What follows is, in fact, a charming if perfectly unreasonable tale of sentiment. The whole affair has a freshness of savor for which the dutiful follower of current fiction must be grateful. For the story cannot be ranged in any of the familiar categories. It is neither tragical, comical, historical, criminal, sociological, nor even romantic-comical-sociological. It is a very simple story of the kind which very simple novelists are helpless to produce.

The book is, it will be seen, a bit of imaginary autobiography—purely imaginary, it must be admitted, so far as its form is concerned. No boy of "Patrick Isaac Ennis's" age, even if he had a college behind him, instead of a reform school, could write as this autobiographer writes. On the other hand, it may fairly be held that the author, being a romancer, not a realist, is successful in expressing the feeling and the mental experience of such a boy better than he could express it himself. Patrick Isaac Ennis is taken from the "House of Refuge" by a benevolent Dr. Joyce, an inventor and dreamer. This gentleman has already in charge a girl of about Patrick's age, whom he has some time earlier rescued from a still more desperate plight. These are the partners three. It may be said at once that Patrick Isaac Ennis (he is "Pie" to his partners) does not marry the girl, or even aspire to marry her. Beyond this item we do not wish to divulge any fact whatever in connection with a delightfully unconventional (yes, with its improvident genius, long-lost heiress, and all) romance.

The Lodger Overhead. By Charles Belmont Davis. New York: Charles Scribner's Sons.

The middle-aged bachelor who is sufficiently confirmed in his estate to watch life clearly from his own cosy corner, intervening at times to play the cynically benevolent *deus ex machina*, is a common enough type in fiction. The bachelor in the present collection of stories is a vague, Van Bibber-like person on whose elaborate furniture and fine linen and free use of cabs much stress is laid. He lives, of course, in apartments over a millinery shop, just west of Fifth Avenue, and not far from the theatrical district. He moves in good society; just how far below the

society which Mrs. Wharton has made her own, a humble reviewer who writes for money finds it impossible to say. But Mr. Davis's folks do go down to the quieter Southern winter resorts, and drive out in their own motors to country clubs.

After injecting quite a dose of abstract speculation into his first story, our author seems to have had enough. At any rate, he settles down to dispensing narrative of a mildly moralistic, mildly sentimental flavor without particular character or distinction. Is it a trace of amateurishness, or is it actual fondness for a certain feminine pose that makes no less than five of his heroines, in moments of mental travail, lean forward in their chairs with their faces resting in their palms and their elbows on their knees? He gets commendably close to reality in the story of the brilliant girl who married a good-natured vulgarian without the sense of humor. A half-page description of a hurried meal at a railway luncheon-counter, is very nearly perfect. The story as a whole is excellent.

Nadir Shah. By Sir Mortimer Durand. New York: E. P. Dutton & Co.

Sir Mortimer Durand deserves credit for having at least hesitated before he cast this work into the form of fiction. Nadir Shah was a great Turkoman soldier of the eighteenth century, who advanced through blood to the throne of Persia and set about the conquest of the Orient. His government, as here represented, was an able, iron despotism, tempered for a time by the influence of a humane Indian woman whom he made first his captive, then his queen. Against his sway a conspiracy was formed, which he repressed with barbarities reminding one of "Titus Andronicus." Involved in the plot was the shah's own son, whom he visited with the most horrible punishment. So much of the story, and it is the main part of it, seems to rest on pretty firm historical ground. There is material, certainly, in the life of Nadir Shah, for an extremely interesting historical monograph. But some of the sources were difficult of access and some of the evidence, as usual, contradictory. The author, therefore, preferred, while preserving as carefully as possible the known facts, to draw also on unsifted tradition and on his own acquaintance with the East and to a considerable extent on imagination to heighten the interest and color of his narrative. The narrative moves. It is written in a clear, straightforward style, not without force. It is enlivened by nearly a score of illustrations, some of them old and curious. Except for the character of the heroine, which savors something too much of the Occident, there is little to offend the sense of verisimilitude. Yet the book, like most others of its kind, fails between two stools: as fiction, it leaves us rather cold; as history, it leaves us rather suspicious.

Philip the Forester: A Romance of the Valley of Gardens. By Daniel Edwards Kennedy. Brookline, Mass.: The Queen's Shop. $4.50.

By the accompanying note to the public and by the sumptuous price announced therein, this book rightfully demands, first of all, comment on its exterior. The private press and bindery of the author are its birthplace. The large pages are printed from type on Italian hand-made paper of noble quality. The margins are lavish; the print handsome; the binding, an æsthetic dull red paper backed by a cool brown muslin, suggests no ephemeral fiction, but a real book sitting in honored company on the shelves of a real library. The proof-reading, especially in the matter of spelling, is not unassailable, whether from the simplified point of view or from that of the opposing camp. For the luxuriant commas there may be champions. They are at least a novelty to-day.

The contents, after disclosing beautifully printed title-page, dedication, and list of subscribers' names, concern themselves not with the Hewlett-like fantasy one might predict from the name, but with an American, oh! very American! mill-town and farming country, and with a young man who holds enlightened views on trees. Much of the action passes in the barroom of the "Golden Dog." The rest in bucolic and sylvan settings. Sincerity, good faith, nature-love, may not be questioned in counting the merits of the work. For detailed criticism as to form and style, the fiction reviewer, having sung the praises of the outer book, respectfully refers inquirers to the critic on bookbinding.

Dictionary of the Bible. Edited by James Hastings, D.D., with the cooperation of John A. Selbie, D.D., and with the assistance of John C. Lambert, D. D., and of Shailer Matthews, D.D. New York: Charles Scribner's Sons. Pp. xvi, 992. $5 net.

A Standard Bible Dictionary. Edited by Melancthon W. Jacobus, D.D., Edward E. Nourse, D.D., and Andrew C. Zenos, D.D. New York: Funk & Wagnalls Co. Pp. xxiii, 920. $6.

A Commentary on the Holy Bible. By Various Writers. Edited by the Rev. J. R. Dummelow, M.A. Complete in one volume; with general articles and maps. New York: The Macmillan Co. Pp. cliii, 1091. $2.50 net.

If it be true that the Bible is not known and read to-day as in the time of our fathers, at least the demand for helps to its further elucidation seems almost unlimited. Seven or eight years ago appeared, practically at the same time, the large four and five-volume dictionaries of the Bible, edited by Cheyne and Hastings, respectively. While these met the wants of scholars, they did not meet the demands of that much more numerous body who could not afford such large and expensive works, who could not consult them in libraries, and who wished to have on their shelves some handy work to which they could refer speedily. To meet this demand two one-volume dictionaries of the Bible have appeared simultaneously, the one edited by that veteran dictionary-maker, James Hastings, the other by Dean Jacobus of the Hartford Theological Seminary. Both of these works represent approximately the same theological and critical position. They are conservatively critical.

Dr. Hastings's Dictionary is not an abridgment of his larger five-volume work. While he has had in this the cooperation of Dr. Selbie, who coöperated with him before, his other assistants, Dr. Lambert and Prof. Shailer Matthews of the University of Chicago, are new. The list of scholars contributing is also quite different from that contributing to the larger work, and American scholarship is very much better represented, presumably owing to Prof. Shailer Matthews's coöperation. Occasionally, it is true, an article in the smaller Dictionary is written by the same person who wrote the corresponding article in the larger work, but this is the exception. The print of this work is small but clear. Space is carefully economized; and there is almost nothing in the way of preface or introduction. There are no illustrations and but one map of "the ancient East," which, we regret to say, is poor, inaccurate, and not up to date. At the close of the volume there is an additional note to his article on Assyria and Babylonia, by the Rev. C. H. W. Johns, intended to correct the chronology of that article on the basis of King's "Chronicles" and Hilprecht's "Chronological Tablets from the Temple Library at Nippur."

The editor of the "Standard Bible Dictionary" is an American, and the bulk of the writers in this volume are American scholars, the Hartford Theological Seminary furnishing the principal contingent. It is interesting to note, as indicating the connections of scholarship in England and America, respectively, that, whereas only two German scholars contribute to the English work, five Germans and one Dutchman are named in the much smaller list of contributors to the American volume. The latter is printed in larger type and contains over 400 illustrations, wood-cuts, half-tones, and maps, some of which are admirable, others mediocre, and a few bad. Most of the illustrations are from photo-

graphs taken by recent explorers, among which the pictures of implements and utensils furnished by Professors Grant and Paton are particularly valuable. The topographical chart of Jerusalem, accompanying Professor Paton's article, deserves special commendation for the clear-cut view which it gives of the physical conformation of the city and the ingenious way in which, by printing the letters and the numbers on the tissue-paper cover, instead of on the map itself, one obtains an unconfused view of the whole. The "Standard Dictionary" is furnished, further, with thumbholes, lettered to correspond to the articles, so that the user may turn quickly to the word sought. The larger articles are divided into sections by box-heads, numbered consecutively to facilitate cross reference.

In scholarship, the two works stand on about the same plane, and, as already stated, the critical and scholarly point of view in both is practically identical, as shown by a comparison of such articles as Abraham, Jerusalem, and John. The American work is somewhat more inclined to be homiletical and to deal with theological topics, or questions of belief. In text content, it is about one-fifth smaller than the English work. At the same time, from its practical arrangement, its larger print, and its abundant illustrations, it is presumably the better adapted for the class of users for whom it was intended—busy ministers, Bible-class teachers, and Bible students.

For the same class of readers, the Macmillan Company has published a one-volume commentary on the whole Bible, edited by the Rev. J. R. Dummelow. This work is more distinctly Anglican. Very few American and no German names are included in the list of contributors, while the great majority of the writers are clergymen of the Church of England. The editor prefaces his work by the Collect for the Second Sunday in Advent, from the English Prayer Book. After this most readers would expect to find a very pious and antediluvian volume. That this is not the case is evidence of the great change which has taken place in the point of view of Bible scholarship in the last few years. The results of modern biblical criticism are frankly accepted in this volume, and, while the writers of the various articles and of the commentaries on individual books are strictly orthodox, their orthodoxy is sane and reasonable, and there is no apparent consciousness of any conflict between orthodoxy and scholarship. The introduction to this volume comprises 143 pages, consisting of general articles, dealing with Hebrew history, Pentateuchal analysis, the Laws of Hammurabi, Hebrew prophecy, the religious development of the Jews, and other literary and archæological topics, together with a description of Palestine, a Bible chronology, and discussions of the more important doctrines of the Christian faith. The commentary occupies almost 1,100 pages, of which somewhat more than 600 are devoted to the Old Testament and a little less than 500 to the New, the latter, therefore, receiving relatively much the fuller treatment. The commentary on each book is prefaced by an introduction, containing an analysis of the book, with a discussion of questions of authorship, date, religious value, etc. The commentaries are necessarily short, but quite as long probably as the average student desires. There are a few good, but rather crowded and over-condensed maps, in black and white, at the back of the volume.

These three books are really valuable additions to the Bible literature of the English reading world. The preacher, the missionary, the Bible-class teacher, the intelligent layman, desirous of studying behind the letter of his Bible, provided with one or the other of these dictionaries and this commentary, has really in those two volumes a complete and very effective equipment for the study and interpretation of the Book, an equipment very far in advance of that which good technical scholars possessed not many years since.

Siena, the Story of a Mediæval Commune. By Ferdinand Schevill. New York: Charles Scribner's Sons. $2.50 net.

This book differs from similar popular histories in emphasizing the economic bases of Sienese civilization. But let no one suppose that such devotion to the dismal science implies a dull book. On the contrary, the method lends concreteness and veracity to what otherwise might be a rather incoherent chronicle. Mr. Schevill is refreshingly free from the common vice of personifying his generalizations. He shows us the actuality—not Liberty or Democracy advancing, but the little traders upsetting the privileges and prerogatives of the big ones, and then the working people getting even with both classes of their former betters. These motives not merely explain the successive and confusing changes of the city government, but also tell us why no stable rule was possible. Siena is typical of all Italy in this failure to subordinate the good of the group to that of the state. It is one of the paradoxes of history that, after inventing and elaborating the idea of the state for all time, Italy for nearly twenty centuries should afford a classic example of the evils of particularism. From this lack of real civic spirit Siena was peculiarly a sufferer. She did develop, however, a substitute in a volatile local pride and a graceful self-sufficiency that make her civilization highly characteristic and picturesque. In intelligence she was never rich. No poet, scientist, or inventor of the first rank was born within her gates. Rich she was, chiefly in enthusiasm. "Soft Siena," as she early was called, readily produced revellers and saints, the plotters of massacres, and the artists who celebrated the mystic Mother of God and patroness of the city.

Mr. Schevill is keenly alive to these aspects of his subject, and has compiled his text so skilfully, interweaving fine bits from the chronicles, that his book should fully hold its own with its many excellent predecessors. Its defect is merely in the minutiæ of style. A certain wordiness and an occasional bluntness of idiom detract from a sensitive reader's pleasure. These lapses might easily be remedied in a second edition. The chapter on the art of Siena is inconclusive and not very suggestive. Her preëminence in the beautiful art of enamelling should have been mentioned, while the charm of her painted sculpture in wood surely deserved a word. In denying to Duccio high quality as an illustrator and setting him down as a decorator primarily, the point of Mr. Berenson's criticism seems to be missed in transcription. Duccio is one of the greatest of illustrators, only his *genre* was discursive. The epigones of the fifteenth century are dismissed rather cavalierly because they refused to be progressive. Sassetta, Matteo, Sano, and the rest at least cultivated their little gardens with utmost fidelity and delicacy. They show what charming variations might still be played upon the apparently moribund Byzantine tradition. No form of art is dead so long as any one practices it with love and intelligence. It seems the part of good taste, then, to take these belated masters for what they are, without crushing them under the obvious and gratuitous comparison with the giants of Florence.

This book contains a number of good photographic illustrations. It is so judiciously made, so sanely enthusiastic, and so compact that, with a little mending of the rougher spots in the text, it should take its place with the best popular works on this much bewritten but never exhausted subject.

The Story of the State of Washington. By Edmond S. Meany, Professor of History in the University of Washington. New York: The Macmillan Co. $2.25 net.

Coincident with the opening of the Seattle Fair appears Professor Meany's excellent account of the new State in which it is held. He writes with the interest natural in one whose own development has been involved in the development he describes. His pictures and judgments of men and events,

though warmly patriotic, are never extravagant; the detail, though somewhat long drawn for the general reader, is none too elaborate for the public the author has especially in view, the high schools and colleges of Washington itself; the correctness of his statements is always well vouched for by reference to the good authorities from which they are derived.

Physically, Washington offers many a smiling area in the midst of ruggedness sometimes forbidding, but often most picturesque. It possesses in Puget Sound a vast haven into which more than into any other the commerce of the Pacific may in future be gathered. A fascinating list of characters figure in the story. We begin with Drake and the Spaniards of the sixteenth century with whom he fought; in due time come the later navigators, Cook, Behring, La Perouse, and Vancouver. The enterprise of the New England captains, Robert Gray at the head, is celebrated, an enterprise so marked that almost to this day a "Boston man" among the Indians is the more intelligible equivalent for American. The explorers by land are a company no less worthy, Mackenzie, Simon Fraser, and John McLoughlin, on the British side, with Lewis and Clark, Marcus Whitman, Frémont, and Isaac I. Stevens, on the American. For a decade and more it was doubtful whether the land would go to England or the United States. The influx of an American population, however, decided the matter, and though the 54° 40′ northern line, which we coveted, escaped us, we obtained all we could rightfully claim.

In Professor Meany's story no man seems to us to approach more nearly to the heroic stature than Isaac I. Stevens. He fell at the head of his division, with the national colors in his hand, in a successful effort to withstand the rush of Stonewall Jackson on the Federal capital after the Second Bull Run, September 1, 1862. It has been asserted that at the moment Lincoln was considering his appointment to the command of the army in Virginia. We know of no authoritative evidence of this, and it is improbable, for it was the misfortune of Stevens, and of his country, that he fell in the first serious battle in which he was engaged. He had had no opportunity to become known. Nevertheless, the record of Stevens in the West (of which possibly Lincoln was well informed) makes one feel that he might have done well even in that high and difficult post. He led his class at West Point, then after service in Mexico was chief of the coast survey in the Federal city. Made territorial governor of Washington in 1853, he also became head of Indian affairs and of the surveys undertaken for a northern Pacific railroad. Professor Meany calls him "a human dynamo"; and his energy in the midst of large and perplexing responsibilities, sometimes at peace, sometimes at war, was no more marked than were his tact and courage. Some of the best soldiers of the civil war, North and South, got their training under him on the frontier. The account of his surveys is a work of the highest value in the history of Western development. He made a good record in Congress. His death occurred when he was but forty-four, at a moment when the future seemed burdened with honors for him. If any men might contest with Stevens primacy among the founders of Washington, it would be such railway kings as Henry Villard and James J. Hill. But it must be remembered that in all their work they have but stood upon Stevens's shoulders: he labored and they entered into his labors.

Wanderings in South America, the Northwest of the United States, and the Antilles, in the Years 1812, 1816, 1820, and 1824. By Charles Waterton. Including a memoir of the author by Norman Moore, M.D. With illustrations and a brief introduction by Charles Livingston Bull. New York: Sturgis & Walton. $2.50 net.

The Andean Land (South America). By Chase S. Osborn. Chicago: A. C. McClurg & Co. 2 vols. $5.

The interest in South America which was aroused by Mr. Root's visit continues to bring forth its harvest of books. Among them is an attractive reprint of Waterton's fascinating "Wanderings," which it is a pleasure to welcome. Like White's "Natural History of Selborne," Waterton's "Wanderings" can never have too many editions. His vivid and faithful pictures of life in the jungle are ever new and always entertaining and instructive. Mr. Bull's all too modest introduction makes one wish he had given more of his own impressions of the region which it was his good fortune to visit a century after Waterton. Unfortunately, his experiments with photography were unsuccessful, and his drawings are rather too fanciful to be of much value. An appreciative memoir of Waterton, largely autobiographical, compiled by Dr. Moore, who was a friend of the great naturalist's old age, adds in no small degree to the worth of this edition.

Of Mr. Osborn's two attractive volumes, encumbered as they are with statistics and information of the guide-book kind, one cannot speak in such high praise. They are decidedly not up to the standard of recent books on South America, being neither so entertaining as Ruhl's "Other Americans," so informing as Martin's "Five Republics," or so accurate as Keane's "South America." The author is a Michigan "newspaper man," and many of his stories smack of the Sunday supplement. A breezy journalistic style that tolerates "a swift poke in the solar-plexus" is hardly adapted to a book of this kind, even when it is offset by a dreary compilation of statistics for the cities and towns of the West Coast. There are, besides, chapters filled with "personal mention" of fellow-passengers, stars, albatrosses, and whales. But one cannot help wishing that this space had been used to give more adequate treatment to Brazil and Argentina. To the Falkland Islands is allotted an exhaustive chapter, and Chili is gossiped about at considerable length. A remarkable description of Valparaiso's earthquake by an eye-witness and an entertaining account of the journey over the Uspallata Pass are worthy of special note. As an aid to travellers, however, the work is of doubtful value, for the information in regard to railways leaves out of account the important progress of the past two years, and there are many serious inaccuracies. For instance, one may *not* "coach from Oruro through Sucre to La Paz easily in four days"—or in fourteen; and there *are* excellent passenger ships that sail from New York to Buenos Ayres.

Nevertheless, Mr. Osborn's remarks on our trade with South America are important and deserve to be widely read. Especially noteworthy is the letter from a Chilian importer who complains of the packing by American manufacturers as "one of the most disgraceful and discreditable things imaginable. It is coming to that point where no concern wants to import from the United States, if they can possibly get the goods from Europe. It is a positive pleasure to see goods unpacked from German exporters." This subject arises continually in all the reports that come from South America. As Lincoln Hutchinson said three years ago, in his "Report on Trade Conditions in Brazil":

> We have heard so much about the necessity for correct packing, the minute attention to details of orders, the indispensability of long credits, etc., that we turn from them with a shrug. Yet the reiteration is made necessary by our exporters' persistent disregard of these factors.

Science.

The Behavior of Noddy and Sooty Terns. By Dr. John B. Watson. Paper Number VII from the Marine Biological Laboratory at Tortugas. Washington: Carnegie Institution.

This paper of sixty-eight pages forms one of the most important of recent contributions to ornithology. The author spent two and a half months on Bird Key, with the object of observing, as closely as possible, the details of the lives of the two species of terns found

breeding there. Of the Noddy Terns there were about 1,400 adults, while the colony of Sooties numbered more than 18,800.

The food and the feeding habits, the courtship, nest-building, care, and external development of the young, and the entire daily activity of both species are minutely described, each phase of study being subdivided, and an excellent summary given of each. Contrary to what we should expect, these web-footed birds apparently never touch the water except to drink or bathe, and if they fall accidentally into the sea, they are unable to swim against the tide. The male and female, although indistinguishable externally, have each their separate work during the early breeding season, the latter building and guarding the nest, the former obtaining food for both. The proof of perfect, yet inexplicable, recognition between the bird and its mate, its nest and young, is very striking. The most significant experiment was that of removing one bird of a pair, marking it distinctly with oil paint, liberating it at a distance from the island, and then noting the time of return to its nest. One bird, taken more than sixty-eight miles, returned in eleven hours, while the individuals which were carried by steamer a distance of 1,080 miles, to a point just north of Cape Hatteras, were seen back at their nests several days later. In this case, however, their mates had already found new partners, and they were not permitted to resume their share in the care of their own young. Dr. Watson has no explanation to offer, saying that the facts obtained from these experiments "are extremely difficult for current theories of orientation to explain."

The author is primarily a psychologist, and his language in a number of instances is made unnecessarily technical by the use of such terms as intra-organic pressure. Although this pedantry of expression is familiar to psychologists, the simplicity of the facts, together with their general interest, would seem to warrant recounting in terms of more common usage.

The photographs of the birds, their nests, and eggs, are excellent. When we have biographies, such as this, of many more birds, together with a more thorough knowledge of their structure and development, we may at last hope for light upon the evolution and relationships of these most difficult subjects of study.

Dr. G. L. Walton's "Practical Guide to the Wild Flowers and Fruits" (Lippincott) is another serious attempt to aid the beginner in identifying a good many common plants by means of their most obvious features. The primary divisions are based on color: subsequent ones on the more striking characteristics of stems and leaves. Of course, such a scheme for aiding everybody to find out the names of plants is open to many objections on the ground of superficiality and incompleteness, and there is hardly a page with which a professional botanist might not find much fault. But if the book can help anybody to know more about the plants of common life, it may serve a useful purpose. The drawings as a rule are not satisfactory, and in one or two instances are distinctly misleading, but they are supplemented by a few good colored plates, and by an excellent reproduction of an old print of Dioscorides. Dr. Walton's plan has the merit of extreme simplicity, and in practice may be of service to a good many persons who would never take the trouble to study a botanical book of the most elementary character. The book shows how certain puzzles can be worked out, ending with the names of the plants.

The Berlin Akademie der Wissenschaften has issued a number of grants for research, including: 2,300 marks to Professor Engler, for his work on the Vegetable Kingdom; 2,000 marks to Professor Schulze, for his work on the structure of the lungs of birds; and 3,000 marks to Professor Escherich, for his study of the Termites in Ceylon.

Samuel William Johnson, professor emeritus of agricultural chemistry at Yale, died July 21, at the age of seventy-nine years. In 1855 he went to the Sheffield Scientific School, where he taught for forty years. He was president of the American Chemical Society in 1878, and since 1866 a member of the National Academy of Sciences. His best known book, "How Crops Grow," is used extensively in England and America, and has been translated into German, Swedish, Italian, Japanese, and Russian. His other books are: "Essays on Peat Muck and Commercial Manures," "Peat and Its Uses as Fertilizer and Fuel," and "How Crops Feed."

The death is reported, at the age of fifty-one, of Alexander Anderson, since 1885 professor of natural philosophy in Queen's College, Galway, and since 1899 president of that institution. He published a number of papers on mathematical and other scientific subjects.

Art.

Royal Palaces of Spain: An Historical and Descriptive Account of the Seven Principal Palaces of the Spanish Kings. By Albert F. Calvert. New York: John Lane Co. $1.50 net.

The seven palaces described in this latest volume of the Spanish Series are the Alcazar, the Escorial, El Pardo, Aranjuez, La Granja, Madrid, and Miramar. The last hardly conforms to the popular idea of a palace, being a simple country-house of unpretending English architecture, destitute of historic interest or art treasures, the summer home of the royal family, where for a few months the formalities and etiquette of Madrid are laid aside. Three of the remaining six palaces were erected by Philip V, who, after the War of Succession, amused himself in lavishing millions upon La Granja and Aranjuez, and, later, owing to the destruction by fire of the Alcazar at Madrid, was forced to rebuild the royal residence in the capital. Mr. Calvert's Handbook ought to turn the attention of travellers to La Granja, far surpassing Versailles in the magnificence of its fountains and natural scenery, and easily reached by carriage from Segovia, itself one of the most interesting but least-visited of Spanish cities, although readily accessible by rail from Madrid. On this royal retreat, set in the midst of pine-covered hills and dominated by the Pico de Peñalara, Philip spent 45,000,000 crowns. Its gardens are its real glory, whereas the palace, in the degenerate taste of the Regency, cannot compare with the Escorial, its solemn neighbor on the opposite side of the same Sierra, or with that finest of Bourbon palaces, whose white walls rise above the Manzanares in Madrid.

The homes of royalty, in spite of their gorgeous monotony, are everywhere objects of curiosity to the travelling public. It may be doubted, however, whether those of any other country so justify this interest as do the palaces of Spain, either as the scenes of momentous events or as the repositories of art treasures. Certainly, no construction in Europe is so stamped with the character of its builder, so conforms to the spirit of its time and its natural surroundings, or leaves so distinct an impression of its Imperial master and his age, as the Escorial. Few, if any, of the actual abodes of royalty can boast of rooms rivalling the throne-room, Giardini room, or Hall of Ambassadors of the Madrid palace, or match its collections of tapestry and art furnishings. No existing royal retreat so reveals the personality of its creator as does that paradise of the melancholy pleasure-sated Philip in the Sierras, of which he said: "It has cost me three millions and amused me three minutes." And outside of Spain there is no Alcazar. Mr. Calvert says in his preface:

> These palaces of the haughtiest royal race in Europe are endowed with the rarest treasures of art and taste, such as only a semi-despotic Power could accumulate in bygone days. It is the object of this little book to reveal these riches to the curious in such matters by means of illustrations, the accompanying text being only to be considered in the light of explanatory notes and chronological data.

The text and 165 small but excellent illustrations fulfil the promise of the preface.

A. C. McClurg & Co. publish "The Standard Galleries of Holland," by Esther Singleton. When one reads that Miss Singleton is the author of "Great Pictures Described by Great Writers," one knows what to expect—a compilation from all sorts of sources, put together without discoverable method. Miss Singleton announces that she

has "endeavored to avoid all criticism by adopting the spelling [of artists' names] used in the official catalogues of the . . . galleries; and in a few instances these are not agreed." This may be the proper course, but it would have been as well to give cross references. In the Index Vermeer of Delft appears, but the reference is only to his View of Delft at The Hague. One looks elsewhere and finds entries (in this order), Meer, Jan van der, the Younger; Meer, Van der; Meer, Jan van der. On looking these up in the text, the dates given for the first and third are irreconcilable with those of Vermeer. There are no dates at all in the paragraph referred to in the second entry, and nothing whatever to indicate that this is the same painter as Vermeer of Delft, but the picture referred to is the celebrated Girl Reading of the Rijks Museum. In the text, but not indexed, is a reference to Vermeer of Utrecht, who may or may not be one of the other Van der or van der Meers. Surely it is the duty of a writer to afford some guidance through this labyrinth.

The death is announced of Jules-Clément Chaplain, the eminent engraver of medals. He was born in 1839, and studied under Jouffroy and Oudinot. Among his better known bronze medallions are those of Renan, Robert Fleury, and MacMahon.

Finance.

Forty Years of American Finance. By Alexander Dana Noyes. Second edition. New York: G. P. Putnam's Sons. $1.50 net.

Since 1898 students of the economic history of the United States have been under a heavy debt to Mr. Noyes for his "Thirty Years of American Finance." The present volume renews and greatly increases that obligation. It adds to the author's invaluable history of the period extending from 1867 to 1897 an accurate, dispassionate, and well-reasoned account of the decade that ended with the panic of 1907.

The five new chapters, which narrate the events of the last decade, begin with the "industrial boom" that started in 1897. After pointing out that the great increase in the world's gold output and the accompanying worldwide rise of prices contributed to the expansion of industry in all countries, the author shows that our own industrial expansion began with the return of agricultural prosperity in 1897. As usual, deficient harvests abroad and "bumper" crops at home were the cause of this prosperity, which, on account of the continued rise in the prices of staple products, has continued to the present day. At about the same time occurred the noteworthy growth of our export trade in manufactured products, which led to so much talk of our "industrial invasion" of Europe. The direct result of these developments was the accumulation of large credits abroad which contributed to the stability of our rickety currency system, and made our money market for a time independent of Europe.

Such conditions favored, of course, the growth of speculation. Our newly acquired wealth entered the investment market and rapidly absorbed the available supply of railway securities and public loans. Promoters of companies were not slow to take advantage of such an opportunity, and by 1899 and 1900 were busily engaged in the manufacture of "industrial" securities to meet the demand of investors. If speculation was active in those years, it became frenzied in 1901. Numbers of factories were consolidated into large corporations, large corporation was joined to large corporation until the outcome was a Trust, and then came the gigantic holding company, owning a number of Trusts. Every stage in the process was attended with the manufacture, then the duplication and reduplication of securities, most of which were absorbed by gullible investors; until it seemed as if no scheme could be so reckless or visionary as to fail of support by the investing public. A new era in finance had come, in which men "thought in billions," and none of the old laws of trade were thereafter to apply to American industrial development.

The Northern Pacific episode in May, 1901, in no way affected the sources of the country's real prosperity, but, with other developments of that year, did give warning to investors that things could be overdone, even in the new financial era; so that in 1902 speculation was considerably less active. Most of the great men of finance, however, took no warning; and, continuing to promote companies of more and more doubtful stability, found themselves caught in 1903 in a "rich men's panic." This disturbance was but temporary; and after a short retardation, the wheels of industry revolved as before. By 1905 continued agricultural prosperity and rising prices for commodities led the great men to renew the boom in stocks; and this they did with capital procured abroad and by using the credit and other resources of the great corporations they controlled. Simultaneously in various countries of Europe, in South America, and in distant Japan, there occurred outbursts of speculation. On the surface, at least, things were going as they should in a new era which had formulated its own laws of trade, and, incidentally, abolished fear and possibility of panics.

But underlying conditions were no longer what they had been in 1901. Business in practically all lines was as good as ever, if not better than before; but for that very reason made greater demands upon the country's supply of capital. And in European markets, the lines were tightening. Industrial activity was intense, and to this was added unrestrained speculation in various countries; meanwhile two great wars had destroyed some three billions of capital that might otherwise have been available for industrial or commercial purposes. Discount rates in the money centres were a sure indication of approaching strain on the world's supply of free capital, and experienced observers gave warning of possible danger. If ever there was a time for prudence and moderation in stock speculation, the two years preceding the panic of 1907 were such a time.

What our great men did, however, was to draw upon the resources of the financial institutions under their control and utilize the credit of their railways and other corporations for the purpose of inaugurating a boom in stocks. When falling bank reserves and rising discount rates brought this process to an end, they then had recourse to foreign loans, and this even at the very season when, according to the old-fashioned finance, it had been thought necessary to husband resources in order to move the crops. By the close of 1906 foreign borrowings had risen to a total of $500,000,000, and American markets were clearly dependent upon European, in which capital was already scarce in proportion to the demand, and was becoming scarcer. Meanwhile, in this country various revelations of wrongdoing in high places were destroying confidence in the morality of our new financiers as well as confidence in the safety of their methods, so that the great men finally had the stock market pretty much to themselves.

By the fall of 1906, further borrowing in Europe had become impossible, and Wall Street had to appeal to the Federal Treasury for relief. Railways found it difficult or impossible to market their bonds, and were obliged to issue their notes in order to complete construction work and meet maturing obligations. By the middle of 1907, not less than $300,000,000 of such notes had been issued. The spring of that year had brought news of crises in Egypt and Japan; October was to report others at Hamburg and in Chili. In March and August heavy sales of securities on the New York exchange, evidently by some of the great men and for the purpose of obtaining ready money, gave evidence that new-fangled methods of abolishing panics might go wrong after all; while a number of business failures indicated an increasing strain on capital. When the panic actually broke, a notorious "chain" of New York banks and a "speculative" trust company were the actual storm centre; but it might just as well have been precipitated in some other way. Since October, 1907, we have heard little of the new finance which was to supersede all the old laws of trade.

Such a summary as this falls far short of doing justice to Mr. Noyes's masterly array of facts in their proper sequence and his searching discussion of their meaning. Through the mad speculation of 1901 and the reckless operations of 1905 and 1906 our author studied, as they occurred, the events he now reviews as historian; he is equipped as is no other man for the task he has so well performed. In those days he was never dazzled by the most brilliant operations of the new finance, or deluded by the sophistries of its accepted exponents; and his history of the past decade is as good a vindication as could be written of the old-fashioned finance based on the teachings of reason and experience.

In any survey of such a wide field differences of opinion must inevitably arise at some points, and Mr. Noyes cannot, and doubtless did not, expect to escape all criticism. His opinions are certain, however, to have great weight, and his critics will have no easy task. Particularly valuable is his discussion of the significance of the Northern Securities case; also his analysis of the nature of the speculative movement of 1905 and 1906, and his pitiless dissection of the assertion that Mr. Roosevelt caused the late panic. By way of criticism, it may be pointed out that it is misleading to say, as Mr. Noyes does, that the currency act of 1900 provides that notes once redeemed "shall be held in the reserve fund until exchanged for gold," without adding that elsewhere the statute provides a method by which apparently the notes may be reissued without such exchange.

On Tuesday, July 27, shortly after the close of business on the Exchange, announcement was made of a quarterly dividend of ¾ of 1 per cent. upon the common stock of the United States Steel Company. This quarterly rate, if maintained, will put this stock upon a 3 per cent. basis instead of the 2 per cent. basis prevalent since May, 1906. The ruling prices of this security for some time have portended an advance in dividends. Just before the actual announcement of the increase it closed at 71¼. The earnings reported for the quarter ended June 30 would seem to justify the action of the directors, although the figures of earnings for 1906 and 1907 are not approached. Unfilled orders stand at over four million tons, and the outlook for future production is therefore encouraging.

Fallacies of Protection

By FREDERIC BASTIAT

New Edition. 8vo, $1.00 net.

This famous treatise of Bastiat, which, three-quarters of a century hack, exercised so large an influence in the economic literature of Europe, has, in its English version, been out of print for a series of years.

The large measure of attention that is being given on both sides of the Atlantic to the issues discussed by Bastiat has warranted the production of a new edition. The introduction prepared for the book by the Prime Minister of Great Britain indicates the direct connection of Bastiat's teachings with a most active question of the day.

IMPORTANT BOOKS

THE WARS OF RELIGION IN FRANCE: The Huguenots, Catherine de Medici, and Philip the Second, 1559-76. By JAMES WESTFALL THOMPSON.

The volume, representing nearly seven years of study, including two prolonged visits to France, is based upon a careful examination of original sources, and contains a valuable appendix of hitherto unpublished documents from the archives of Paris and London. It treats of the epoch of the Reformation, but does not attempt to deal with the religious conflict except in so far as it influenced the political, diplomatic, and economic activities of the period. Our whole interpretation of the sixteenth century, of course, has been profoundly changed by the recent progress in economics; and in the matter of industrial history and of the retroactive effect of wretched existing conditions, as also in the development of the Holy League of France out of certain political and social forces, the book makes decidedly new and valuable contributions. 618 pages, 8vo, cloth; illustrated; net $4.50, postpaid $4.84.

MODERN CONSTITUTIONS. By WALTER FAIRLEIGH DODD.

This collection contains the texts, in English translation, where English is not the original language, of the constitutions or fundamental laws of the Argentine nation, Australia, Austria-Hungary, Belgium, Brazil, Canada, Chile, Denmark, France, Germany, Italy, Japan, Mexico, Netherlands, Norway, Portugal, Russia, Spain, Sweden, Switzerland, and the United States. These constitutions have not heretofore been available in any one English collection, and a number of them have not before appeared in English translation. Each constitution is preceded by a brief historical introduction, and is followed by a select list of the most important books dealing with the government of the country under consideration. 2 vols., 750 pages, 8vo, cloth; net $5.00, postpaid $5.42.

PRIMARY ELECTIONS. By C. EDWARD MERRIAM.

For students of American political history, and especially of American party history, this volume will be particularly valuable. It gives a clear account of the various laws and cases, and a critical discussion of the present primary question. The absence of literature on this subject makes the appearance of the book especially timely. Many general readers, as well as the special students, will find it of interest. 300 pages, 12mo. cloth; net $1.25, postpaid $1.35.

CHRIST AND THE EASTERN SOUL: The Witness of the Oriental Consciousness to Jesus Christ. Lectures delivered on the Barrows Foundation in India, Ceylon, and Japan. By CHARLES CUTHBERT HALL.

The task undertaken is to show the best elements in Oriental religion, and to point out in just what way they may contribute to Christianity, which is in its essence, stripped of institution and dogma, Eastern in both origin and spirit. Analyzing the Oriental consciousness, Dr. Hall finds four great elements of strength, which he defines as the Contemplative Life, the Presence of the Unseen, Aspiration toward Ultimate Being, and Reverence for Sanctions of the Past. He considers that mysticism is really at the heart of both Eastern and Western religions, and shows wherein Christianity may become more vital through the introduction of certain mystic strains, and Oriental mysticism more virile by knowledge of the personal God of the Western World. The book is written in an effective style, behind which one recognizes the winning personality of the author. 250 pages, 8vo, cloth; net $1.25, postpaid $1.37.

THE CLEVEREST BOOK OF THE YEAR

ANNE OF GREEN GABLES

By L. M. MONTGOMERY

The Nation.

NEW YORK, THURSDAY, AUGUST 5, 1909.

The Week.

The student of politics sometimes fails to perceive powerful agencies because they lie so near him. He scans the horizon and neglects to look at the thermometer. He seeks far-off clues for seemingly recondite actions, and never remembers that the actors are men of like passions with himself. In legislation, particularly, the powers of simple human endurance cannot be neglected. Ennui, the demands of sleep and hunger, have often drafted whole sections of important measures. Pope, in his social satire of Queen Ann's time, has recorded how towards evening

> The hungry judges soon the sentence sign
> And wretches hang that jurymen may dine.

The habit persists—let us hope not in the courts—but in almost every other sphere of political activity. President Taft is said to have remarked good-naturedly that the place of summer heat in our Constitutional system had been strangely overlooked. The remark must have given a momentary cold shiver to the lightning-defying members of Congress who were going to resist to the death the President's suggestions of shading various tariff duties. It takes a grim soldier like Grant to announce that he proposes to fight it out on this line if it takes all summer. But, seriously, there is no doubt that no small part of the coercive power of a determined executive lies in his ability to call an extra session which will tax the resisting powers of an intractable legislative body.

An instructive illustration of the same truth is found in the British Parliament at the present moment. Here it is the craving for sleep that gives the Cabinet the whip-hand in pushing the finance bill through the House of Commons. The custom of holding night sessions which extend far into the small hours of the morning, makes opposition a test of nerves. The innumerable amendments which are offered to the Government's proposals are threshed out between yawns and impromptu naps. The closure is regularly applied, and the Conservatives who are so hopelessly outnumbered dread to be caught sleeping away from their posts. Mr. Balfour's philosophic calm must suffer many a wrench as he envies the large brute vote of his opponents, a vote so large that their Whip can show more leniency than his own faithful vote-catcher. The Chancellor of the Exchequer counts upon getting to ed at 2 A. M.—barring accident—while the grim gray dawn of four o'clock marks bed-time for the Tory generalissimo. But even the Liberals have had to give a respite to the presiding officer, and have brought in a special rule enabling the deputy chairman to apply the legislative guillotine—a power which, until now, he has not wielded. This wicked extension of gag-law has left Mr. Balfour almost speechless. It is almost enough to shake his "foundations of belief."

We know, of course, that the direct primary is dead. We know it, because we have been told so. No sensible man favors it; no practised politician will touch it. It is the pariah of politics. Still, this authentic news does not seem to have reached some men who might hear of it with advantage. Here is ex-Gov. Warfield of Maryland, for example. He was supposed to know something about the art political, yet we find him so benighted that he is proposing to induce the Democratic party of Maryland to make the direct primary an issue in the coming State campaign On Saturday next he is to offer resolutions at the Howard County primary in favor of direct nomination of "all candidates for public office," including United States Senators. The foolish man argues that this system would bring about a great reform in party management. But State Senator Gorman, in a fine illustration of heredity, takes issue with the ex-Governor. He declares that direct primaries would "injure" and possibly "disrupt" the Maryland Democrats. It may be, however, that this was exactly what ex-Gov. Warfield meant by reform.

A good illustration of our mechanically hide-bound currency system is seen in the difficulty experienced by banks in securing notes of small denominations to meet the demand incident to the crop movement. The Comptroller of the Currency has just issued a circular letter to explain how small notes may be secured by the banks. In case the banks hold silver certificates, the Treasury will accept them in exchange for certificates of lower denominations But already the certificates constitute the bulk of the currency in the form of one-dollar, two-dollar, and five-dollar bills. To relieve further the demand for small notes, Comptroller Murray suggests to the banks that they convert their circulation of the higher denominations into five-dollar notes. This can be done by replacing the larger notes when redeemed by an equivalent amount in five-dollar notes. The law provides that not more than one-third of a bank's circulation may be in five-dollar notes, but at present the one-third limit has not been reached by over $90,000,000. In case banks are willing to pay for an engraver's plate costing $75, the conversion of banknotes of the higher denominations into five-dollar bills will be expedited by the Treasury. The limitation in the law probably aims to create a vacuum in the circulation which will be filled by the silver certificates. So long as we have to provide channels for the monetary use of over-valued silver, this may be defensible. But the rigid limitation of the denominations in which bank currency may be issued works against the public interest upon those occasions where trade requirements are for small bills.

The action of Thomas L. Lewis, president of the United Mine Workers, in overruling the strike declared by Francis Feehan of the local union in Pittsburgh, is highly commendable. The strike, which threatened to involve about twenty thousand men, was ordered by Feehan in the rashly belligerent spirit of the inexperienced labor leader. It required nerve on the part of his superior to command the miners to return to their work pending negotiations with the officials of the Pittsburgh Coal Company. An amicable agreement was reached with the operators, which is said to portend industrial peace in the coal regions for months, or possibly years, to come. This fortunate adjustment of a threatening difficulty illus-

trates the power for good that lies in really sane management by union leaders. The unions themselves may be expected to learn by experience the wisdom of avoiding strikes, except as a last desperate resort. Too often the temporary popularity of a labor leader seems to depend upon his hasty assent to ordering a strike, but such short-sighted men are bound in the long run to be east aside.

The notion that the anti-liquor movement has suffered a temporary set-back at the South was severely shaken by occurrences reported last Thursday in three Southern States. To a visiting delegation of ministers, Superintendent Bowyer of the Naval Academy at Annapolis said that unless the practice of selling intoxicants to students were stopped, he should recommend removal to another locality. The Annapolis liquor dealers may note that this utterance is not merely that of an influential officer, but that it has the support of the Bureau of Navigation. In the Republican State Convention at Norfolk, Va., the antipathy to the liquor traffic was again very much in evidence. The liquor plank in the platform was rejected, and by a vote of 700 to 310 a substitute declaring for local option was adopted. It is noteworthy that the prohibitionists were in a large majority and that local option was conceded as a method of saving the face of the committee on the platform. The drastic law pending in Alabama is remarkable. By this new law the possession of an internal revenue tax receipt is made *prima facie* evidence of guilt. Any officer may close any place that is accused of selling liquor, and upon the accused rests the burden of disproof. Social clubs are to be compelled to agree not to evade the law, and the penalty for their disobedience is the forfeiture of their charters.

If a comparison were instituted between Dogberry and his Baltimore counterpart, before whom Senator Stone was last week acquitted of assault, it would be decidedly in favor of the original. Not in vain does the prisoner at the bar in Maryland plead for acquittal on the ground of being a fellow-Caucasian. It is true that extenuating circumstances could be urged for slapping a Pullman porter. Senator Stone had explicitly ordered a drink of Scotch and a *large* tumbler of water. The whiskey was brought along with a *small* glass containing *some* water. This, of itself, would go far to justify mayhem. Superimposed upon the outraged dignity of the Senator from Missouri was an unconscionable delay in serving his chops. The Senator "wanted to know," and his chaste interrogatories were shrouded in dashes and asterisks. The blow followed, and the statesman was haled to the bar of Baltimore justice. The "cold neutrality of an impartial judge" intervened. The weary Solon from Missouri needed not to plead his Constitutional immunity from arrest. The presiding justice had also encountered the annoyances and resented the offensiveness of Pullman porters. The defendant was discharged. Now let us hope that wars may cease and arms give place to the toga!

The report that five West Point cadets are to be sent to their homes pending final decision as to whether they are to be expelled, is gratifying. It shows that the Commandant, Col. H. L. Scott, and the officers are abating not a jot in their desire to free West Point from the disgrace of hazing. Their failure to receive proper support from the last commander-in-chief, who deliberately overruled their recommendations made in compliance with law, might easily have discouraged them. Mr. Roosevelt's action in yielding to political pressure and mitigating the sentences of dismissed cadets may have been a direct cause for this fresh outbreak of brutality—for the gentle sport of hitting a cadet over the head with a tent-pole hardly deserves any other term. What Mr. Taft will do is now the chief object of interest. Last year, we had Col. Scott's word for it that the failure to uphold his hand was subversive of the discipline of the entire institution. President Taft must see, with his judicial training, that permitting cadets to overrule their lawful superiors means the triumph of insubordination. There could hardly be a case more likely to bring out clearly the difference in the cast of mind of Mr. Taft and his predecessor.

Much merriment is made at the expense of Prof. James H. Hyslop, secretary of the Society for Psychical Research, at the way the "spirits" are making free with his domestic concerns. It should appear that the spirit of Dr. Hodgson is averse to the proposed marriage of Professor Hyslop, on the ground that the latter should devote himself exclusively to the work of psychical research. Hitherto, messages alleged to have come from the spirit world have been unutterably trivial in their import. A Berlin professor said, in a lecture, some years ago, that whether there were spirits or not, there was no need of giving them heed until they developed some slight spark of intelligence: "So lange die Geister so furchtbar geistlos sind," was his witty way of putting it. But now the situation is serious. When these attenuated shades begin to interfere with a man's domestic arrangements, it is high time that they should be investigated.

Last Friday's complete triumph of the Wrights puts the crown to what was already a series of unexampled achievements with the aeroplane. It is clear that their machine could have flown from Calais to Dover and back again, with ease. The almost perfect control shown in the cross-country flight from Fort Myer to Alexandria and return, over hills and valleys at varying altitudes, makes the feat as startling as it was record-breaking. We may be sure that the telegraph will have carried every detail to Europe, where the imagination will be as deeply impressed as it is here. In the patient development of their idea, the Wright brothers have displayed qualities which we like to think distinctively American; and their cool poise and modesty in the hour of dazzling success will but add to the admiring recognition which they have won for their country.

To the cry of so many in the Old World against the sale of their art treasures to Americans, Dr. Wilhelm Bode, general director of the Royal Art Museum at Berlin, has added his weighty voice. Hitherto he has stood with the interests of a wide civilization and has opposed any movement to enact legislation prohibiting the exportation of works of art. But now, as our tariff is removed from paintings more than twenty years old, Dr. Bode has been stirred to action, and demands protection. "As soon," he writes in the latest issue of the magazine *Cicerone*, "as the law freeing old art works from duties passes Congress, nearly all these treasures will

go across the sea." He asks what will be left of the European galleries a few decades hence; congratulates England on retaining Titian's Arlosto, Velasquez's Venus, and Holbein's Duchess of Milan, but takes an especially gloomy view of the situation in Germany. "The Campe collection," he complains, "wandered last winter to America, via Paris, just as in the case of the excellent Guthmann silver collection." There seems to be, aside from natural Chauvinism, only one sound reason why old works of art should not be exported to America, or anywhere else. When they are torn away from their natural environment, when a religious picture is taken from its church aisle, when a frieze is removed from the wall of an old monastery, then indeed there is an absolute injury done to art, from the widest point of view, irrespective of local or national selfishness. And consequently there was much æsthetic wisdom in the action of the Italian government in forbidding the exportation of its old art treasures For art in Italy is indigenous, and is placed in a background in which it naturally grew. But Dr. Bode's objection has to do mainly with old art objects already torn from their backgrounds and placed in German and English collections. The sacrilege has already been done.

English Liberals have been doing distinctly better in the bye-elections. Of these, there have been four since Lloyd-George's budget was published, all of which have been hotly contested, and all of which the Liberals have won. Their majorities, to be sure, have dropped much below the abnormal figures of 1906, but have been well up to, and in two cases beyond, the previous Liberal record in those constituencies. The two latest successes—at Dumfries, and the High Peak division of Derbyshire—were peculiarly gratifying. The Conservatives had the strongest hopes of winning both fights, as they had put forth unexampled efforts, and had enlisted powerful interests. In each of the two constituencies, they had obtained the open support of the Catholic clergy, and counted upon detaching thereby a good part of the Irish vote. In addition, they got from the Duke of Norfolk, the great Catholic peer, a letter in favor of their Derbyshire candidate, on the ground that he had pledged himself "to support the interests of our Catholic children in our schools." This clear breach of the privileges of the House was resented by Irish members, and the Duke's letter was referred to a committee to recommend suitable action. But the unexpected Liberal majority will probably be regarded as sufficient punishment for the meddling Peer. It will also, we presume, put an end to the talk of the Lords throwing out the finance bill altogether. The budget was the main issue in all these bye-elections, and the demonstration is clear that, despite savage denunciation in the City and by great landlords, it is popular with the voters.

Soon after the meeting of Czar and Kaiser, the German comic paper, *Ulk*, printed a cartoon showing Nicholas on his travels. He was turning to his Foreign Minister and asking for the speech he was to make to President Fallières. But M. Isvolsky was handing him the same one he had just made to the Emperor William, with the remark that all the addresses exchanged between sovereigns were exactly alike. The witticism gains fresh point from Monday's welcome of the Czar in English waters. He and King Edward greeted each other in almost the precise terms each had previously used in interviews with the Kaiser. The significant thing, however, was the display of England's sea power, no less than 150 warships, including 26 battleships, being drawn up in three lines. The King declared that the "most powerful fleet ever assembled" was not to be looked upon as a "symbol of war," but as a "means for upholding the interests of peace." That, of course, is the customary tribute which hypocrisy pays to virtue; the fact being that this multiplication of battleships is the real cause of what Rosebery called the "hush," in expectancy of war, into which all Europe has recently fallen. The *entente* between Great Britain and Russia, added to that which either has with France, may promote peace temporarily by a display of combined fighting resources, but can do so permanently only by working for a general good understanding, arbitration treaties, and limitation of armaments.

The native question in the new South African Commonwealth has developed into a serious problem even before the Commonwealth has become a complete fact. While the draft Constitution was framing, the eligibility of non-Europeans for the franchise was one of the most hotly contested issues. Cape Colony, which has conferred the ballot on the natives, found itself opposed by the other colonies; and in the draft Constitution the franchise was restricted to British subjects of European descent, with certain guarantees for the maintenance of the *status quo* in Cape Colony. The draft Constitution is now before the Imperial Parliament, to which a representative Cape delegation, comprising two former Premiers, Sir J. Gordon Sprigg and W. P. Schreiner, have addressed a strong protest. They argue that even more important than South African union is the need of assuring fair treatment for the natives. Under the terms of the Constitution, it will be possible in time to shut out the Cape natives from the franchise they have enjoyed for two generations, and exercised for their own best interests and those of the colony. This would be to violate a fundamental principle of the British Constitution and to lay up vast trouble for the future.

The problem that confronts South Africa is, in large measure, an unprecedented one. In our own case and in that of Canada and Australia white commonwealths were built up among native populations so sparse that their elimination as political factors was natural. In New Zealand we find already the need for compromise. There the native Maori population stood in sufficiently high ratio to the white invaders to demand and receive recognition. In the new South Africa, the colored people outnumber the whites by about 4 to 1. In other words, there are too many natives to be disregarded, and there are too many whites for a European oligarchy to be built up as in India. Here is a situation which parallels that in our own South, except that in Africa it would be quite impossible for anybody to advocate segregation on the ground that the colored people have been a curse, instead of a blessing, and don't belong where they are. In South Africa, it is the white man who is the intruder, and unless he is willing to accept the cheerful policy of extermination for the native, the white man must make up his mind to grant him rights commensurate with his progress in civilization.

THE TARIFF OUTCOME.

The tariff bill which passed the House on Saturday, even the President's optimism is unequal to pronouncing satisfactory; and the formidable opposition of Republicans in the House, despite the strongest party pressure, with the continuing hostility of Western Republican Senators, shows how far the measure is from meeting the demands of the people. Its reception by the press is, at best, a damning with faint praise. Many Republican newspapers, particularly in the West, continue to denounce the bill as falling far short of the pledges made by the party and Mr. Taft, and as containing too many of those iniquitous bargains, struck in the dark, which have come to make protection synonymous with fraud. With public opinion so mixed and heated, a calm and fair review of what has been done, and what left undone, is more than ever called for.

It is only just to admit that the President's insistence did wring something from the high-tariff extortionists. Bad as the final bill is in many of its features, it still has to be said of it, as we said of the Payne bill when it passed the House, that it is the best tariff law ever enacted by the Republican party. One Dingley citadel—the duty on hides—was completely blown up; several others are badly shattered. Taking the bill section by section, we find the reductions in duty far more numerous than the increases. This is not saying that the net result will work out in a remission of taxes on the necessaries of life. That can be determined only after actual trial has been made. The estimates and predictions made on either side are inconclusive. Certainly, Chairman Payne's table, attempting to prove that taxes have been lowered on $4,000,000,000 worth of "goods consumed," is worthless. He does not venture to say that the actual cost to the consumer of any one of those articles will be less in consequence of the new tariff. In the metal schedules there has been a sweeping reduction—averaging rather more than 50 per cent. This brings the duties considerably lower than in the Wilson bill. But these iron and steel duties are wholly unnecessary and usually inoperative. Their only effect can be, not to lower present prices, but to prevent a domestic monopoly from pushing prices too high. In other words, the maximum of tariff exaction has been cut down: that is all. What definite benefit the consumer will realize in house and shop, remains problematical.

With all the reductions that are to be thrown into one scale, there are certain failures to reduce, with some actual and indefensible increases, to go into the other; and it is a question if these are not heavy enough to outweigh the reductions. First among these outrages, stand the taxes on clothing. These are wickedly made higher. The Wilson bill sought bravely to do something for the consumer by making wool free and woollen clothing cheaper; but the Dingley law put back the premium on tuberculosis, in the shape of highly taxed wool and woollens, and it is left untouched in the present bill. And the duties on cotton goods are increased. Chairman Payne confesses that the advance is 3 per cent.; but experts in the cotton business have taken the various grades, kind by kind, and duty by duty, and shown that the increases run from 8 to 47 per cent. Now, this right to levy on the common people, precisely like the one conveyed in the silk schedules, was granted in one of those midnight agreements with manufacturers which make the protective system a sink of political corruption. The right persons went to Washington to "see" Aldrich, and came away openly boasting that the thing had been "fixed." It is the old scheme of plunder in full vigor.

About these worst of tariff taxes, President Taft has not said a word directly and publicly. He may not have known the full measure of their iniquity, or he may have found the plunderers too strongly entrenched in the Senate to be dislodged, at present. Nothing can be more certain than that these cotton and woollen and silk duties come under the head of those rates which, as Mr. Taft said to the stand-pat Congressmen on July 16, were "excessive," and therefore could be cut down without injuring any industry. But instead of being lowered, they are raised. There is just one hope. If the President uses the authority given him to appoint an expert and unpurchasable tariff commission, these monstrous schedules may be exposed in their oppressive operation, and shown by such an array of evidence to be burdensome and criminal that Congress, under Presidential urging, may be led to revise them separately. Only so can we now expect even to approximate a tariff that shall be "scientific"; at least in the sense of not being scientific thievery. If the President has really enlisted for the entire war, he will press forward along these lines.

The history of tariff reform in this country has, it must be confessed, been too often that of hopes deferred and hearts made sick. When the compromise tariff bill of 1833 was passed, promising the ultimate abolition of protective duties, the *Evening Post* declared its "deep and sincere gratification" that "the restrictive system had been given over to a sure though lingering dissolution." Little could the editors of that day have imagined that their successors would, seventy years later, still be fighting the same enemy. They did not know so much as Americans have since learned of the persistent and demoralizing power of men bent on securing laws to make them rich at the expense of their fellows. In the long warfare against this form of unscrupulous greed, many eyes have been opened. The latest to be disillusioned is President Taft. Of his honesty and sincerity in working for tariff revision no man can have a doubt, but how easily he promised what he has not been able with arduous labor to perform! He spoke readily to the people about extensive revision of the tariff downwards, but finds those in possession of the plunder too mighty for him. In the presence of the gray realities, after all the rosy predictions, he is in a position to appreciate the force of the words which a shrewd old kinsman addressed to Lord Cromer, when the latter was just back from America in 1864: "Now, that you are a young man, you should write down, not what has happened, but what you think is going to happen. You will be surprised to find how wrong you are."

Yet for Mr. Taft's final position, having put his hand to the plough, he cannot look back. He owes it to the country, and to those tariff-reformers who have loyally held up his hands, to make it clear that, in one way or another, the fight against dishonest tariffs must go on.

CAUSES OF SPAIN'S UPHEAVAL.

When the Prime Minister, Señor Maura, was defending before the Spanish Cortes the military expedition to the Riff coast, he declared passionately: "Cost what it may, Spain will never con-

sent that, between Muluya and Tangier, a single man shall be allowed to plant his foot who is not either a Spaniard or a Moroccan." The Premier knows now better than he did then what a terrible "cost" the country was facing. The army has suffered a great reverse with serious losses. Worse than that, its leadership and administration have been proved incompetent; while its discipline has crumbled. But the really startling thing is the way in which an unpopular war, with the stripping of the home garrisons, has been taken advantage of for letting loose a spirit of fierce revolt and deliberate anarchy at a hundred points in Spain. No one seems to have suspected its existence, at least in any such force. Discontent in Catalonia has, of course, been as chronic as sullen; and the Terrorists of Barcelona have from time to time committed outrages. But that the whole land should so without warning have burst into flame, comes as a great surprise. The authorities were taken wholly unawares. Among the keenest observers of existing Spanish tendencies, there was no Arthur Young to predict the breaking out of this revolution.

Yet its causes must have been long silently at work, and some of them we can now trace. Spain is notoriously the land of violent contrasts. She has her painters of the joy of sunlight and the sea, but she also has artists that revel in the sombre and repulsive. And, as Havelock Ellis has shown, the tradition of cruel strife and bloodshed was fixed in the Spanish character by the long centuries of hand-to-hand warfare with the Moors. In Spain, the maddest passions may be lurking behind outward gayety and perfect manners. With heterogeneous populations difficult to rule, the kingdom has yet been making apparent progress. After her loss of colonial possessions in 1898, Spain made great efforts to pull herself together, to put her land under more intensive cultivation, to develop her mines, to improve her manufactures and means of transportation. And she could point to many signs of encouragement and success. Her young King was personally popular, and her statesmen and business men were flattering themselves that they had entered upon an era of order and prosperity. But swiftly the crash came. It was as if the foundations had secretly been undermined.

Disintegrating forces have, indeed, been at work. Chief among them is a radical propaganda that has drawn to its service some of the ablest writers and thinkers in Spain. They are not openly revolutionists, much less anarchists. The dynamitards are not of their school. This literary group has devoted itself, rather, to a dissolving analysis of current ideas, especially those ideas upon which Spain has been nourished for many years. The attack has been upon excessive militarism, upon a repressive civil rule, upon a too absolute and intolerant Church. One of the surprises and terrors of the present upheaval has been the fury of assault upon churches and monasteries and convents. This is in part anarchistic delirium, but an anti-clerical movement has long been preparing in Spain. No one who recalled the immense excitement, a few years ago, over Galdós's play, "Electra," which was supposed to be a demonstration against the Church, could doubt that hostility to the extreme pretensions of the ecclesiastical party was certain to play an important part in Spanish politics.

Perhaps as good a way as any to enforce the point is to quote a few passages from a Spanish writer now in great vogue. Vicente Blasco Ibáñez is a novelist who has allied himself to the revolutionary movement—in idea and effect, at least. The book of his which is most distinctly upsetting in tendency, and which has had an enormous sale—enormous for Spain—is "La Catedral." In the guise of a story, the author undertakes to set forth a modern philosophical Spaniard's view of the institutions of his country. The words are put into the mouth of one of the characters of the novel, but they are naturally taken as the writer's own, and have gone resounding over Spain. There is no outright advocacy of revolt, no open appeal to force. Simply, church and state are shown to be animated by obsolete conceptions, and made into instruments of oppression and injustice. We cite:

> In Spain, three centuries of intolerance and of undue priestly domination have made our nation the most callous in matters of religion. The ceremonies of worship are now mere routine. . . . In truth, the church is dead. What we combat is only its corpse.
>
> The monarchy is a dead thing. Between the country and it, the relation is the same as that between a living man and a cadaver. The age-long inertia of Spaniards, their reluctance to change, their fear of the unknown, which they share with all unprogressive nations, are the only reasons why this institution continues among us, where it does not even have, as elsewhere, the justification of military success or the enlargement of the national territory.

His ideas about the army, Ibáñez dramatically throws into the form of a conversation between a Cadet in the Military Academy at Toledo, and the philosophical radical who is the protagonist of the story. The youth is naturally filled with dreams of glory in the career of arms. The other paints for him the harsh reality: to teach raw recruits and do the meanest offices for them; to be a mere policeman, called upon now and then to shoot down a striker. There would be no possible chance of "defending the country heroically against the invader." "Rest assured that the invader would not need more than two pitched battles to destroy our entire army." The talk goes on, with a leaning which helps explain recent events:

> You consume the largest part of our national outlay, yet you live in wretchedness, concealed, to be sure, but still wretchedness. A lieutenant has smaller pay than some artisans. . . . You yourselves suffer, dragging out this life of proletariat of the sword, and the nation complains. . . . Believe me, for a modern army, you are too few and too badly organized; for an internal police force, you are too numerous and too costly.

It would be as easy to multiply these quotations as it is to imagine what the subtle effect of such thoughts must be when spread broadcast through the nation. It was a combination of philosophy and misery which brought on the French Revolution. Spain to-day has not, happily, the abject misery of the peasants of France in 1750-90, but she plainly has the unsettling philosophy which leads to revolutions.

DEBONAIR FALLEN STATESMEN.

A new fashion seems to be coming in for defeated Premiers, dismissed Chancellors, Presidents in exile, and deposed Sultans. They no longer wear the rue. They are expected, rather, to be distinctly jolly, even flippant. For them the great game is lost, and the world looks to them to show that they are "good losers." No lugubrious regrets, after the manner of Wolsey or Strafford; no gloomy predictions of woe, now that they are gone. Smiles and jests are the latest style for fallen statesmen. We see

Clemenceau exemplifying it, as he walks away jauntily from the official residence, flourishing gayly the cane which is the sole piece of property he finds himself able to carry away. Prince Bülow did not display, after his fall, quite this Gallic lightness of spirit yet in his long interview with a correspondent of a Hamburg newspaper, he frequently broke into laughter. Even the hatred of the Polish members of the Reichstag, which, as he said, led to his defeat, appeared to him a cause of merriment. It is plain that the fourth German Chancellor will not, from his retirement, pour out such savage reproaches and vitriolic insinuations as did the first one from Friedrichsruh. Prince Bülow surrenders office blithely humming, "A la guerre comme à la guerre." They have to put on a brave front, these fallen statesmen of the present day, and take the frowns of fortune in a jovial spirit.

This is due partly, it seems probable, to the growing habit of regarding politics as a kind of game. The stakes are high, and you play with all the absorption and skill of which you are capable; but if the cards run persistently against you, are you to make the room ring with your curses, or perhaps go out and shoot yourself? Are you to imagine that the game will not go on just because you are out of it? No, the political gamester must have something of the *aplomb* of a Dangerfield. Temporary reverses he must meet with the cry of "patience, and shuffle the cards"; and when his opponents make the *grand coup* against him, he is to take his losses like a good sportsman, and smilingly bow right and left as he quits the table. His triumphs are over—except for the last possible triumph of hearing the observers say: "Anyhow, he is a dead game sport."

And it is precisely this public in the modern world, attending every movement and hanging upon every word of the public men whose glory is departed, that helps to force upon them a gayety which they must assume if they have it not. No moping in dark corners can be thought of, for there are no dark corners any longer. Statesmen out of office are under the glare of the press almost as fully as those in office. The public demands full intelligence. "We know how he bore himself when in power; how does he act out of it? Is he morose and vindictive? Or do the old quips flow from him as easily as before?" No statesman nowadays falleth unto himself. He sits for his photograph in the eyes of the whole world; and vanity, or pluck, does the work of adjuring him to "look pleasant."

Another reason why public men lay down office with a more smiling grace than used to be common, may lie in the fact that they do not over-value themselves. The world will wag on, whether they come or go. A great lesson for every man is said to be to learn that he is not indispensable; and more men in public life are learning it. They may be called upon to say a long farewell to all their greatness, but the nation means to be as great as ever, institutions will remain, and other men will be found to preside over their workings. By training himself not to take himself too seriously when in office, a statesman will find it easier not to take his fall from power too seriously. If he constantly repeats to himself,

> This same flower that smiles to-day,
> To-morrow will be dying,

he will be in a position to make a brave and even smiling death of it, when his turn comes.

Dismissals from office have often been effected with a certain hilarity. When Fox was thrown out of the Cabinet, Lord North's mode of communicating the news to him was delicious. "His Majesty," he wrote, "has thought proper to order a new Commission of the Treasury to be made out, in which I do not see your name." One wonders however, if Lord North, who could thus jest at scars when he had never felt a wound, was equally gay of spirit when the time came for his own name to be left out. Men in modern public life certainly show very often that they are not foolish enough to suppose that their retirement will eclipse the gayety of nations, and they do not propose to let it eclipse their own.

STUDENT ACTIVITIES.

In the August *North American* Mr. Theodore Stanton gives a sort of blanket approval to the extra-curriculum interests that engross the attention of our university students. He speaks from full knowledge of the subject, having resided some four months with undergraduates in their house on the Cornell campus. The picture he presents is not unattractive. If idle hands were the devil's only opportunity, the average student should apparently be immune from temptation. It is true that the activities in question do not seem particularly germane to the cloister. But they keep busy their participants in body and mind; their ends, if sometimes a bit trivial, are not blameworthy; and they undoubtedly foster an *esprit de corps* and make mightily for college enthusiasm. It is not athletics alone or principally which are in question. The management and control of college publications, daily, weekly, monthly, and annual, typify the least questionable of these extra-curriculum activities. But dramatic and musical associations, the ever-present management of clubs and fraternities with all the petty politics surrounding their organization and elections, and a thousand and one other societies or associations all come into consideration. It is true, as Mr. Stanton admits, that at the dining-table these "activities were generally more talked about than university studies," or at least were "neck and neck," but despite the "baneful influence of the 'practical' engineering courses," they are said to keep the tone of undergraduate life sufficiently "elevated."

But when one comes to analyze critically this plea for activities that crowd the supposed objects of college study into a corner, it is tolerably certain that it is a case of the good being the enemy of the best. We decline altogether to accept the testimony of an anonymous alumnus whom Mr. Stanton quotes. His graduate of two years' standing "engaged in the wholesale coal business . . . in one of the large New York towns" returns, and asks the admiring seniors and juniors to guess what part of his work at college did him most good? Modern languages? No. English? Far from it. Political economy? Wrong again. No, it was the training he got as manager of the baseball nine. Nothing that this venerable coal dealer has ever yet done "in the actual business world" has so far put such a strain on him or so greatly enlarged his feeling of responsibility as his elective course in baseball management. The untutored mind of the uncloistered world might ask why a boy should go to college at all, if the characteristic college training is so inferior to what every young fellow must experience when he goes into business.

Why spend four years and the money it costs to obtain the kind of training that is unavoidable the moment one starts to earn his bread and butter? If this is the kind of defence to be offered for college activities, it is time to recommend passivities, in all conscience.

Perhaps the most defensible of these extra-curriculum activities are those connected with college journalism. But this is largely because they are most in touch with the studies that properly make up an indispensable part of college work proper. The daily theme in an English course involves a training not essentially different from reporting some college event, or writing an editorial comment on the news uppermost in the college world. But from this point down the absorbing interests that mortgage the time of the college boy range from the relatively indifferent to the positively harmful. The name scholar implies leisure, not hustle. Schools have always required isolation and segregation. Business ability must develop in a crowd, but scholarship requires quiet. A recent graduate of Brown University is quoted who compares the Oxford student with the American college youth. He believes that our system makes for "robust enthusiasm as opposed to gentlemanly dilettanteism." This verdict displays at once an utter perversion of the proper object of a sound college training. In the opinion of most competent educators, the English university man has acquired a facility in the field of thought which our American graduates lack. If put among books, he is not lost. He has a sense of touch and a sureness of apprehension that only our best students display. Instead of making college life more "practical" in the sense of burdening it with alien tasks, the first step in reform is to relieve it of just such extraneous burdens.

Not even Mr. Stanton contends that all of these "activities" are free from censure. He intimates broadly that the fraternities, in which he admits the "activities" have their mainspring, need reforming. But it is safe to say that they will never be reformed until the proper business of the college is made central in the life of the student body. Revolutionary as it may sound, we are of the belief that the proper activity of the student is study. Not until the extraneous organizations which have fastened their tentacles upon the time and ambitions of the student body can be cut away, and a free course can be offered for the play of mind upon the abundantly engrossing interests of the intellectual world will our undergraduate life be free from the reproaches that now fasten upon it.

PITFALLS OF BIOGRAPHY

The theory has been advanced that, eventually, the novel will be supplanted by the biographical form. This is unlikely, for one thing that endears fiction to the reading public is not merely the consciousness of the interesting tale and characters, but the sub-consciousness that this *is* fiction—that story and characters are merely figments. The biography, on the other hand, has no such ally. It is stripped of glamour. It is simply a beam of dry light which plays more or less gracefully upon an isolated specimen of humanity. Theoretically, the task of writing biography is simple; in practice it demands, like poetry, absolute perfection. Of poetry, a certain college instructor remarked that "a pretty good poem is like a pretty good egg." The same holds true of biography. Indeed, Carlyle has said that "there is no life of a man, faithfully recorded, but is a heroic poem of its sort, rhymed or unrhymed." Small wonder, then, that he who attempts biography should often attain merely the mediocre.

Mr. Edmund Gosse has recently been lecturing upon "The Pitfalls of Biography." Perhaps his most piquant comment is that modern biographies often present too great a wealth of detail. He avers that the biographer, through haste, is often unwilling or unable to winnow his material. This extrusion of details should, in this critic's estimation, be regulated by a law that nothing is to be used except what vitally illustrates the character or career of the subject. But the screening process may easily lead to distortion more serious than a mere chaos of incidents. For if once the biographer regards himself as anything but an impersonal mouthpiece, pure biography will suffer. If he allows his own personality to intervene like a lens between subject and reader, though a charming or stimulating image may be formed, it will be something other than biography. An author of this sort is likely to fall into the pitfall of writing from a thesis of his own. Such a result is to be observed in Mr. G. K. Chesterton's book on Dickens which, though it makes no definite claim to being a biography at all, is illustrative of the adroit —perhaps unconscious—suppression of facts for the sake of predetermined conclusions. The lesson of a man's life is a task, not for the author, but for the reader.

Of course, the greatest and most insidious temptation to one who writes enthusiastically of another is to place his subject upon a pinnacle. In so doing he thinks himself actuated by the noblest of motives. It is phrased by Fielding:

> As it often happens that the best men are but little known, and consequently cannot extend the usefulness of their examples a great way, the biographer is of great utility, as, by communicating such valuable patterns to the world, he may perhaps do a more extensive service to mankind than the person whose life originally afforded the pattern.

Fortunately, Fielding did not apply this theory to his novels, else we should have been deprived of "Tom Jones" as it now stands. The impersonal attitude of the author of that novel toward his characters is of a type which is the greatest desideratum in biography. The life of any man, however good or great, is a welter of acts which range all the way from nobility to actual misdoing. The true portrait gives both sides. We are reminded of Sir Roger de Coverley's commentary when he showed to his guest a certain portrait in the family gallery:

> The next heir . . . was this soft gentleman whom you see there. Observe the small buttons, the little boots, the laces, the slashes about his clothes, and, above all, the position he is drawn in (which, to be sure, was his own choosing): you see, he sits with one hand on a desk, writing, and looking, as it were, another way, like an easy writer or a sonneteer. He was one of those that had too much wit to know how to live in the world; he was a man of no justice, but great good manners; he ruined everybody that had anything to do with him, but never said a rude thing in his life; the most indolent person in the world he would sign a deed that passed away half his estate with his gloves on, but would not put on his hat before a lady if it were to save his country. He is said to be the first that made love by squeezing the hand. He left the estate with ten thousand pounds debt upon it; but, however, by all hands I have been informed that he was every way the finest gentleman in the world.

The good knight, in his desire to cover both good and bad and in his unwillingness to lay down a definite verdict unwittingly touched the right biographi-

cal note. For, after all, the greatest quality of the true biographer is his self-effacement. He is not the frame which enhances the picture, but merely the easel which holds it up to view that all may see and judge.

Correspondence.

PERSONALITY IN POLITICS.

To the Editor of The Nation:

Sir: Your article of July 22 upon personality strikes at the root of most of our political difficulties. In a great democracy, by the terms of the case, there must be some force which shall induce a majority to work together, and that in spite of a multitude of incessant, disintegrating forces always at work to split it up. No conceivable measure or set of measures will do this. The mass of units, in smaller or larger groups, will always want different things and want them in different ways. Nothing will reach the desired end except individuality so striking as to command the reason of some, the imagination of more, and the senses of all.

Perhaps the most concrete and visible instance in history is that of France from 1789 to 1800, but it is only one of many. But startling as it may seem, it is hardly rash to say that the condition of the national and legislative assemblies up to 1797 was scarcely worse than that of our Congress to-day. Of course, there is no such ignorant and suffering population, but in the framework of government there is not very much to choose. And if we consider that it is repeated in every State and substantially in every city in the country, it is evident that explosive material is not wanting. We have had one warning which might seem to be severe enough. Those who followed the years 1850 to 1860 will remember that the scenes in Congress and the agitation through the country were much the same in kind—though, of course, not in degree—as they are as to the tariff to-day; and that up to the firing upon Fort Sumter neither side had hardly more suspicion of an impending war than they have now. If we consider, again, the growing strife between capital and labor, and the condition of our banking and currency systems as manifested in the last two years, it points to an imperative necessity for some kind of governmental reform.

It is another curious analogy that the French resorted to the same kind of remedy as we are doing. The executive directory and the consulate were merely forms of government by commission. They failed, as this must fail, from the want of personality. In our great crises we have had two men, Washington and Lincoln, to be set off against Napoleon and Bismarck in Europe. The country is visibly ready and eager for another man. How can we insure that he will be of the same kind? Certainly not by the multiplication of battleships or the spectacle of colonial dominion, by leaving an increase of the standing army at the discretion of the President, or enrolling the State militias under the Federal control, to be called out at his discretion. It was his early victories in Italy which gave Napoleon his imperial crown. The destruction of civil liberty almost always finds its beginning in foreign war.

The true defence against abuse of personal executive power is personal executive responsibility. The framers of our Constitution wisely saw and provided for the necessity of the former. They did not see—having little or none of the light which we have—that its control must rest with public opinion, and so they gave that control to the representative body, which experience, then already foreshadowed and since made abundantly clear, shows was certain to be abused by that body. The conflict of the future is not to be as to details either of legislation or administration, but as to the relation of the two branches. President Taft said the other day, in an interview with a committee, that he must view the tariff question from his position as representative of the whole nation and not from that of any Senator or Representative. That is the secret of the whole matter. But it cannot be done in such conferences or even at dinners. It must be done in the open arena of Congress by his secretary of the treasury, speaking on behalf of and under the instruction of the one *personal* chief of the whole nation. If, no matter what may be the result of this session, he will open the next with a demand to that effect, he will have placed his foot on the first rung of the ladder leading to the temple of fame—and peace—and to the third niche, which is awaiting him—or somebody—by the side of his illustrious predecessors.

G. Bradford.

Boston, July 27.

EVOLUTION.

To the Editor of The Nation:

Sir: Notwithstanding the centennial celebration for Darwin, there seem to have arisen various defections from his system, of late years. First, the secession of Huxley, who renounced his former strong faith, before his death, as set forth in his "Romanes Lecture," and in "Ethics and Evolution." Now Darwin's own son, Francis, has renounced the main posit of his father's theory, Natural Selection; and there have been various criticisms, showing a trend of doubt and questionings.

It is a curious thing that Darwin's own doubts and misgivings, as expressed at the close of the first editions of his "Origin of Species," have been ignored and concealed. There he sums up his latest readings, with a strain of doubt and uncertainty. He says that sometimes the evidence *against* his theory seems so overwhelming that he is tempted to throw up the whole thing. He then gives some of these objections. He says, first, that the geologic record is wholly against it; also the fact of the sterility of hybrids; also the missing link, and the simultaneous appearance of new species in various remote parts of the world. He notes the unanimous rejection of the idea by all the scientists of the day. He might have added a fact stated by a noted Scotch scientist, viz.: that, although the evolution theory necessitated that each species should reach its highest and most perfect condition at its end, so that a higher species might be evolved from it, exactly the contrary was the fact. Every species distinctly degenerated towards its end; lower, deformed, and imperfect forms increased, and it ended in imperfection instead of rising into a superior species. This noted fact would be enough to disprove it.

Yet it seems to have taken possession of the whole world. One of its latest developments is noteworthy. Bernard Shaw makes a new statement of evolution, which is very significant of its trend. He states the original force behind the universe to be bodiless and impotent, without executive power of its own: after innumerable tentatives, experiments and mistakes, this force has succeeded in changing matter into the amœba, the amœba into something more complex, until finally there has been a man evolved, with hands and a brain to accomplish the work of the will. Man is not the ultimate aim of this Life. It will go still further, and produce something still more complex than man—the super-man; then the Angel, then the Archangel, and last of all, an omnipotent and omniscient God! This is the climax of the evolution theory.

Of course, Bernard Shaw is not a great, or an authoritative, man. But straws show which way the wind blows; and it is a fact that no consistent evolutionist can escape his conclusion. The fundamental principle of evolution is that *every* higher is evolved out of a lower, and this necessitates the belief that God is evolved out of the highest creature, the Creator out of His creation, the First Cause out of the last effect. Now this is not rationalism, but irrationalism—insanity: and yet it is the logical and rational end and conclusion of the evolution theory. It is a complete inversion of the self-evident law of cause and effect; of the axiom that a cause must be higher than, and prior to, its effect. It is a complete inversion of the fundamental principles of philosophy, and can result only in falsehood, instead of truth.

THE EARLY COLOGNE PICTURES.

To the Editor of The Nation:

Sir: In reference to the article "Art Experts on the Defensive" (*Nation*, July 8), allow me to state that, being rather familiar with the pictures of the early Cologne school, I can only consider as wanton extravagance the suspicion thrown upon them by Dr. Poppelreuter and his followers. The style and technique of these paintings, in Cologne, Darmstadt, Nuremberg, and elsewhere, are closely connected (1) with those of French paintings of the fourteenth century, dating from the reigns of Charles V and Charles VI, an admirable example of which has been recently purchased for the Louvre; (2) with the style of the Parisian miniatures of *ca.* 1400, so well known, thanks to the Belles Heures of Chantilly. Now, in the early part of the nineteenth century, when it is asserted that the forger or forgers exercised their craft, nobody knew or cared about early French pictures or early French miniatures. Moreover, as Dr. Bode has remarked, the museum at Cologne possesses only too many samples of the odious German romantic painting from about 1830; not one of those pictures offers the slightest analogy to the so-called forgeries.

The whole case rests on a πρῶτον ψεῦδος, viz., the assumption that the repainting of the fourteenth century Clarenaltar, in Cologne is the work of a nineteenth century restorer, whereas it is evident that the painting in question was repainted about 1425, precisely by a painter of the school to which belongs the charming Virgin with the Flower, now held up to be a forgery. I have seen that picture repeatedly and found it wonderfully preserved; Dr. Bode has just been to see it and declares that he discovered no repainting in it (*Der Cicerone*, Leipzig, 1909, p. 437).

SALOMON REINACH.

Paris, July 17.

A BOTANICAL MARVEL.

TO THE EDITOR OF THE NATION:

SIR: An interesting natural history entirely made up of misstatements and conscienceless exaggerations might easily be compiled from the writings of the great romancers, from Herodotus down to Tartarin of Tarascon. Such a book should be arranged according to countries and epochs.

In such a work, one chapter would very naturally deal with America; one section of that chapter with America in the eighteenth century. Chateaubriand has the place of honor there—with all those descriptions of North America, in which he has mixed pell-mell tropical and Arctic specimens. The Mississippi River was, at the time of his travels, a most surprising estuary. To look at it to-day, who would guess that it once reeked with "islands of floating pistia and water roses," on which embarked as passengers "green serpents, blue herons, red flamingoes, and young crocodiles"? At the Indian feasts where Chateaubriand smoked the pipe of peace, tobacco's poetic substitute was "the fragrant leaves of the mountain laurel." What though the mountain laurel is odorless and poisonous—what though flamingoes blush not where Chateaubriand placed them, or where Campbell strewed them with a generous hand, in "Gertrude of Wyoming"? It would be tiresome if our writers all knew as much of natural history as they do of rhetoric. We think none the less of Thackeray because George Warrington, in "The Virginians," describes maple sugar-making *in the fall of the year*.

Chateaubriand and Campbell and Thackeray were none of them avowed scientists, like the Philadelphia Friend, John Bartram. In his youth, the Quaker botanist wrote to his brother a letter that has, I think, never been reproduced. I find it in the Dreer Collection at the Pennsylvania Historical Society, in Philadelphia. The letter is undated; it is addressed to the writer's brother William, who was then "keeping store" in the South; the botanist wrote, presumably, from his farm near Philadelphia:

Dear Billy
I was lately told by a man that rides express, that he saw in NoCarolina not far from Cape Fear, a strange plant about as big as a daisy & much like it in flower. I think he called it ye wonderfull flower whose properties was such that if they looked earnestly at it ye petals of ye flower would close up he said ye moors, near Brunswick knowed it well: if it lieth in thy way to speak with Morris More ask him about it if it be true it will be a fine curiosity & furnish matter for Phylosofical contemplation. . . .

It is my opinion that this letter of John Bartram's deserves a place beside the anecdote of the cow and the bear, attributed by the Swedish traveller, Peter Kalm, to the same excellent scientist.

UNCUT LEAVES.

TO THE EDITOR OF THE NATION:

SIR. I should like to take the hand of your correspondent "S." in the *Nation* of July 22. So often have I had the same feeling of indignation, uttered in almost the same language, in view of the "filthiness" of home-cut books and the "exasperation" at having to "fumble" through such leaves. The time wasted in the cutting is bad enough, but is nothing to the precious moments spent in attempts, repeatedly foiled, to separate the fuzzy, ragged edges, not to speak of the dust which will gather in these nesting places.

I have heard that the leaves are left uncut in the interest of rich buyers, who wish to rebind their copies; but the practice is not confined to books in paper or board covers, but is extended to works in what to most of us seems meant to be, at all events must be, permanent binding. But in any case why should the time, convenience, and pleasure of the army of "poor but respectable" readers—noble army of martyrs!—be sacrificed to the whims and notions of the wealthy few?

I have sometimes felt like registering a solemn vow never to buy another book with leaves uncut or—almost equally important—not trimmed flat and smooth.

H. D. CATLIN.

Northumberland, Pa., July 22.

ON TEACHING MORALS IN COLLEGE.

TO THE EDITOR OF THE NATION:

SIR: That the moral condition of our colleges is better than it has been for a hundred years; that the evils of which just complaint may be made are partly infiltrations which no modern college can entirely prevent, and partly incidents of the enlarged and specialized curriculum which makes the teaching of a subject, rather than the care of students, the duty of the professors; that most college evils can be materially reduced by the simple expedient of raising scholastic standards, and that, for the rest, some scheme must be found for looking after the personality of the student as well as subjects of study—these are the main points in a recent lecture of mine to which you have made editorial reference. Perhaps your readers will be interested to have this correct statement.

GEORGE A. COE.

Evanston, Ill., July 24.

[Our comment, in the *Nation* of July 15 was based on this quotation from Professor Coe's lecture as printed in the New York *Tribune* of July 13:

The college is teaching subjects and not educating men. Each professor is answerable for sound teaching of some subject; but nobody holds himself responsible for the moral and religious training of the students. Nobody's rank, salary, or promotion depends on the moral output of the college or the university.

—ED. THE NATION.]

SCHOOLS FOR GIRLS.

TO THE EDITOR OF THE NATION:

SIR: In a letter to the *Nation*, July 22, Dr. Rolfe raises the question of possible schools for English girls in Shakespeare's time. He should take into consideration the nunneries abroad. A charming sketch of the feelings aroused in a Portuguese community by the arrival of a fair English exile on her way to the convent in Lisbon will be found in Francisco Rodrigues Lobo's "Corte na Aldea," Lisboa, 1619. The author says distinctly (Obras de Francisco Rodrigues Lobo, t. 1. p. 113):

A famoza cidade Lisboa, onde muitas Religiozas do illustre sangue de Bretanha vivem santamente em clauzura. (The famous city of Lisbon, where many nuns of illustrious blood of England live holily in seclusion.)

JOSEPH DE PEROTT.

Worcester, Mass., July 23.

THE PROSECUTION OF ANIMALS.

TO THE EDITOR OF THE NATION:

SIR: In the recent discussion of the legal prosecution and execution of animals in the *Nation*, it seems to me strange that not one of your correspondents mentions "The Criminal Prosecution and Capital Punishment of Animals," by E. P. Evans, published in 1906, by Heinemann, in London, and imported by E. P. Dutton in New York. So far as I know, this is the most, if not the only complete work on the subject in the English language. It gives full accounts of these trials, criticises the conceptions of criminality underlying them, and contains in the appendix extracts from the records of such prosecutions preserved in different archives, and a list of 180 criminal processes of this kind during a period of nearly eight centuries.

QUI MORIUNTUR IN DOMINO.

TO THE EDITOR OF THE NATION:

SIR: In the *Nation* of July 22 (p. 74, col. 3), a reviewer records that the authors of "Piccadilly to Pall Mall" attribute to George IV the old jest, *Beati sunt illi qui moriuntur in Domino*. It is cruel to rob Sherry's "fat friend" of even a trifle like this, but the pun is commonly told of Rabelais on his death bed; and no doubt the Gollardi laughed over it long before his time. W. R. T.

Magnolia, Mass., July 27.

Notes.

In the autumn we shall have from Houghton Mifflin Company the first two volumes of "Emerson's Journals," edited by Edward W. Emerson and Waldo Emerson Forbes. These volumes cover the years from 1820 to 1829, and give the record of his first marriage, his doubts as a pastor, and his first sojourn at Concord. Besides much musing on his own inner state, the diary mentions such notable persons as Dr. Channing, Everett, Webster, Carlyle, Thoreau, Margaret Fuller, and Hawthorne

Among the other books announced by Houghton Mifflin Company for autumn publication are: "Susanna and Sue," by Kate Douglas Wiggin; "Farming It," by Henry A. Shute; "Warriors of Old Japan,' by Yei Ozaki; "The Oath of Allegiance," by Elizabeth Stuart Phelps; "New Charades," by William Bellamy; "Autobiography of Henry M. Stanley"; "The Life of Richard Brinsley Sheridan," by Walter Sichel; "The Girlhood of Queen Elizabeth, Told in Contemporary Letters," by Frank A. Mumby; "Fifty Years in Constantinople," by George Washburn; "The Life of James Dwight Whitney," by Edwin T. Brewster; "Diplomatic Memoirs," by John W. Foster; "Recollections of Washington Gladden"; "Wanderings in the Roman Campagna," by Rodolfo Lanciani; "Travels in Spain," by Philip S. Marden; "Greek Lands and Letters," by Francis G. and Anne C. E. Allinson; "A Brief Pilgrimage in the Holy Land," by Caroline Hazard; "The German Element in the United States," by Albert Bernhardt Faust; "The American People," by A. Maurice Low; "The Expansion of New England," by Lois K. Mathews; "The Last Days of Papal Rome, 1850-1870," by R. De Cesare; "Speeches and Addresses, 1884-1909," by Henry Cabot Lodge; "Carlyle's Laugh," by T. W. Higginson; "Lincoln the Leader," by R. W. Gilder; "The Autobiography," by Anna Robeson Burr; "Why American Marriages Fail," by Anna A. Rogers; "American Education," by Andrew S. Draper; "How to Study, and Teaching How to Study," by Frank M. McMurry; "Social Development and Education," by M. V. O'Shea; "The Classical Moralists," edited by Benjamin Rand; "Labor and the Railroads," by J. O. Fagan; "The City of the Dinner Pail," by Jonathan Thayer Lincoln; "Religion and Miracle," by George A. Gordon; "The Right to Believe," by Eleanor Harris Rowland.

We welcome a new edition, with revised bibliographies and some minor corrections, of R. M. Johnston's short biography of "Napoleon." We had occasion to comment favorably October 27, 1904, on the first edition.

Doubleday, Page & Co. issue another volume of their Pocket Kipling, containing "The Naulahka." We have several times before spoken of the exceptionally clear type and beautiful page of this edition. It is to our taste one of the most attractive sets on the market.

From Henry Frowde comes a new edition of the "Authors' and Printers' Dictionary," compiled by F. Howard Collins. Whether or not he will agree with all the details of Mr. Collins's system, any printer or writer will find much benefit from this little book. It gives in dictionary form answers to all the difficult questions of capitalizing, syllabification, abbreviation, italics, and the like.

The two volumes of "The Great English Letter Writers," edited by William J. Dawson and Coningsby W. Dawson, originally published by the Revell Company, have now been reissued by Harper's, who will continue the series, called the Reader's Library, to which this work belongs.

We have received from the Cuala Press of Churchtown, Ireland, a beautifully printed volume of "Poems and Translations," by John M. Synge, the brilliant Irish dramatist, whose death we noted the other day; and from Mr. John Quinn of New York the same book reprinted in similar form. Mr. W. B. Yeats furnishes a brief and fitting appreciation of the man's work. The translations, short bits in prose from Villon and Petrarch's sonnets, are in the peculiar dialect so much affected by the Irish writers of the present day. Of the singing quality of the original verse we can best give a notion by quoting these two stanzas of the "Prelude":

Still south I went and west and south again,
Through Wicklow from the morning till the night,
And far from cities and the sites of men,
Lived with the sunshine and the moon's delight.

I knew the stars, the flowers, and the birds,
The gray and wintry sides of many glens,
And did but half remember human words,
In converse with the mountains, moors, and fens.

Dr. M. A. Stein's account of his exploration in Central Asia, in the *Geographical Journal* for July, contains many interesting proofs of the remarkable literary activity of the ancient inhabitants of what is now an almost trackless desert. In the ruins of a Chinese fort, probably built in the first century B. C., were found over 2,000 inscribed pieces of wood and bamboo, referring "mainly to matters of military administration, often giving details as to the strength, movements, etc., of the troops échelonned along the border; their commissariat, equipment, and the like. There are brief official reports and, more curious still, private letters addressed to officers full of quaint actualities, family news from their distant homes, etc." In some other ruins, in another region, there were discovered over thirty documents with elaborate string fastenings unopened and sealed down on the envelope with Greek seals representing Hercules with club and lion-skin, Eros, and other deities, "deeds probably referring to lands and other real property buried since long centuries under the silent dunes." Of great interest to American readers is the report of the anniversary meeting of the Royal Geographical Society at which the Victoria research medal was awarded to Prof. Alexander Agassiz for his services in the cause of oceanographical research, one, to quote the words of the president, "to whom this award is undoubtedly due, or perhaps I should say overdue." These last words refer to the fact that Professor Agassiz has been engaged in this work since 1874, the results of his expeditions being contained in eighty-three volumes of the Memoirs and Bulletins of the Museum of Comparative Zoölogy.

The recent celebration of the three-hundredth anniversary of the discovery of Lake Champlain was the natural occasion of numerous guide-books to the history of that region. More ambitious and of real scholarly value is the little "History of Lake Champlain," by Walter Hill Crockett, which, coming from the historian of the Vermont commission in charge of the celebration, claims at once some special authority. How much of our history found its theatre on Lake Champlain most of us had forgotten until a few weeks ago, when the commemorative pilgrimages and pageants on the very spot freshened our memories. For those who did not see the celebration this book will bring a surprise, in the fulness of incident it chronicles. The picturesque discovery by the French explorer, the first attempts of the French missionaries to settle the country, seem remote, but the conflicts of Howe and Montcalm are well within the borders of our history, and Ethan Allen's raid and Arnold's naval operations against the British are among the most stirring Revolutionary campaigns. The war record of the lake closes with Macdonough's victory at Plattsburgh, in 1814, but its shores have gathered tradition since, as Mr. Crockett's book shows. For a reproduction of the romantic atmosphere of the lake one must still go to the pages of Parkman and Cooper; this book is occupied with matters of fact. But a complete record of these particular matters of fact could hardly be better done. (Burlington, Vt.: Hobart J. Shanley & Co.).

Ireland does nothing by half, and at those rare intervals when she creates an adventuress she puts gusto into the work. Maria Dolores Eliza Rosanna Gilbert eloped at nineteen to escape a mercenary marriage. By twenty-four she had quitted a husband and become the Spanish dancer Lola Montez. In the eighteen years of life left her she passed from end to end of Europe at the public expense, accumulating adorations *en route;* fairly naturalized herself in the Paris of the greater Dumas and Émile Girardin; episodically sojourned with the Abbé Liszt; became the Egeria (blamelessly, it appears) of Louis I of Bavaria; lingered in a California camp, and flashed through the mining fields of Australia, horsewhipping her traducers as occasion arose; became an author, and a devout Methodist at New York; a dull and decorous lecturer in London; made an edifying end, and was buried under her maiden name in Greenwood Cemetery. In this cosmopolitan and most erratic orbit she retained certain qualities of the "ould sod." It seems, too, as if she never forgot that her father and also her first conqueror were soldiers. She feared neither man nor mob, she bore no grudges, but promptly punished not infrequent affronts with her own hand. When her inexpert lover of the *Presse*, Du Jarier, was hectored into a fatal duel, she mourned that she could not have met the challenger herself. As a dancer her skill was mediocre, but she prevailed through her magnificent animal beauty, and perhaps even more through a pronounced gift for self-advertisement. Everything she wrote herself—and most that has been written about her—suggests vulgarity. Yet her friendship was valued by men of mark, and as next friend and adviser of the King of Bavaria she showed something like statesmanship.

For romantic biography one could hardly wish a better subject, and it is strange that E. B. D'Auvergne's "Lola Montez, an Adventuress of the Forties" (John Lane Co.) does not make a stronger impression. The subject has been studied painstakingly—a very necessary precaution, for Lola habitually drew the long bow; moreover, Mr. D'Auvergne commands an enthusiasm unchilled by discretion. It is probably his rather forced flippancy, and the tiresome reiteration with which he employs Lola as a flail for Philistia that obscure the better qualities of his book. As it is we find his rather jejune Gautierisms almost insurmountable. Perhaps the chief difficulty has been that little autobiography which Lola produced either herself or with the aid of her liter-

ary adviser, the Rev. C. Chauncey Burr. From the unctuous commonness of the production we incline to believe that the Rev. Burr was not consulted. In any case it is a dull and fatuous performance, and barely literate in expression. Though it by no means makes for unrighteousness, one must seek it among the pamphlets that are sold covertly to prurient lads. Now, whoever writes about Lola Montez must cut loose from her own text. Wherever it is quoted by Mr. D'Auvergne it is as lead on the page. Finally, no one can write acceptably the life or legend of this masterful Irishwoman unless he is able to take Mrs. Grundy as dispassionately as did Lola herself.

The seventh volume of the "Works of James Buchanan" (Lippincott) covers less than two years of his service as Secretary of State, and contains much of little interest or importance—formal notes and dispatches upon departmental routine. The good material is thus in a measure buried, and can be found only after considerable futile reading. It was a time of closing some important matters. The Oregon and boundary disputes reached a happy end, and a territorial government for Oregon remained to be framed. The independence of the Hawaiian Islands was recognized and China opened her doors to a commissioner. The American arms had won enough in Mexico to make a peace possible, but the manner of making advances hurt the pride of Mexico and delayed the ending of the war. Buchanan believed that peace could be secured only by completely destroying the "corrupt army of Mexico." His first propositions were rejected, and the extraordinary mission of Trist, "a mere precautionary mission," terminated most unexpectedly in a peace which could be laid before Congress as acceptable. Spain was disciplined for permitting Mexican privateers to leave her ports, and Brazil invited a sharp lecture by her treatment of a street brawl in which some Americans were involved. In fact, our relations with South America were far from satisfactory, due in part to the indiscretions of our representatives and in part to local unrest. The slave trade still called for notice, and claims and discriminating duties constituted a good share of the correspondence in many directions. In constructive reports, that on the consular system of 1846 is suggestive. So far as domestic politics were concerned, Buchanan disapproved the tariff of 1846, thought higher duties on coal and iron were needed to unite the party in Pennsylvania, and disclaimed being a candidate for the Presidency. Altogether, apart from the peace with Mexico, the two years were waiting years.

The ten chapters comprising J. W. Jenks's "Principles of Politics from the Viewpoint of the American Citizen" (Columbia University Press) were originally delivered as lectures upon the Blumenthal Foundation at Columbia University. Their avowed object is to "bring into closer touch than is usual the work of the scholar and of the practical man of affairs." With this end in view, they canvass the nature of the state, political motives, the suffrage, political parties, the three departments of government, and foreign relations. Where the author definitely attempts the solution of a concrete problem, such as the extension of the suffrage, his conclusions are almost always sane and well-balanced. But when this is said, the admirable features of the book have all been named. It is loosely organized. The analysis of fundamental conceptions is hurried and in places superficial. The construction of the text is often hasty, not to say slovenly; and the whole book is impregnated with an atmosphere invincibly commonplace. To illustrate. There is no natural nexus of parts. In the chapter on Representation, the theme of the Gerrymander is shot at the reader without warning or any hint of logical sequence. Illustrative of the constant avoidance of thorough analysis are the casual treatment of natural rights (pp. 40 seq.), the abridged references to the division line between public and private functions (p. 127), and the fragmentary analysis of the separation of governmental powers (p. 127). What shall be said of an author who is content to print an allusion as follows: "Emerson in one of his essays says something to this effect—that the most precious thing in the world is an independent, thinking soul, etc." (p. 51)? The book was written in haste, and the reader suffers who peruses it at leisure.

Under the vaguely attractive title of "Gentlemen Errant" (E. P. Dutton & Co.) Mrs. Henry Cust has brought together four accounts of late mediæval adventurers not likely to be otherwise easily accessible to the general reader. The persons here described are the Bohemian Lev, Lord of Rosmital and Blatna, Wilwolt of Schaumburg, Frederick II, Elector Palatine, and Hans von Schweinichen in Silesia. Each of these accounts rests upon a contemporary narrative, the last upon memoirs of the hero himself. Mrs. Cust's method is to give a short introduction describing the material employed, and then to follow the original narrative as closely as may be, selecting choice bits here and here, and holding the whole together by a slender thread of pleasant comment. At the close of the volume are nearly fifty pages of illustrative notes, showing wide reading and fine comprehension of the records illustrated. There is thus much of unity in the volume, that each of the persons commemorated was a wanderer, whose adventures brought him into relations with a great variety of men and places. This gives variety and charm to a story that might easily become monotonous. Mrs. Cust has succeeded in avoiding the snares of repetition and tediousness that beset the editor of such matter. She maintains a certain liveliness of description and has shown excellent judgment in bringing out what is best worth having. One's first instinct is to wish that these recitals could have been given entire; but, after all, good editing is here very much in place, and we are inclined to be grateful for having our attention called to a type of historical material only too often neglected in our zeal for politics, war, and diplomacy. In these personal accounts we are brought into intimate touch with the feelings and motives of people of all classes and conditions. It is history in undress. These people are, as it were, taken off their guard, and prattle away about all the small details of courts and castles, the open road, the taverns, intrigue, and love-making, with an unrestrained freedom that is quite delightful. Several interesting maps taken from the European History of Æneas Sylvius serve to make the itineraries of the errant gentlemen intelligible, and there are three good contemporary portraits of the Elector Palatine. The book is to be commended to students and teachers of the Renaissance and Reformation as a valuable aid in making the ordinary histories live in the consciousness of our seemingly more prosaic days.

The latest addition to the series known as the Diplomatarium Islandicum (VIII. 3. p. 465-838) contains the Icelandic documents from the thirty-first of August, 1513, to the thirty-first of October, 1521.

Among the posthumous papers of Jonas Lie there was recently discovered the completed manuscript of a collection of fables, closely allied in character to the two volumes entitled "Goblins." The work is to be published this present summer by Gyldendal of Copenhagen.

A hitherto unknown bust of Schiller was recently found in Weimar by the custodian of the Schiller Museum, Dr. E. Scheidemantel. It is the work of a contemporary of Schiller, the sculptor Karl Gottlob Weisser of Weimar, and is an excellent piece of work.

Prof. Adolf Hemme's book, "Was muss der Gebildete vom Griechischen wissen?" has been entirely rewritten, and is published by Eduard Avenarius of Leipzig. It discusses at length the relation of Greek to modern education.

A handy and much needed modern Greek dictionary has been issued by Dr. Karl Dieterich of the University of Leipzig, in his "Taschenwörterbuch der neugriechischen Umgangs- und Schriftsprache." The second part, Deutsch-Griechisch, has just appeared, and, notwithstanding the fact that it is modestly called a "pocket dictionary," is a solid work of more than eight hundred pages, and meets the needs of both the specialist and the student of modern Greek merely for practical use. The method is that of Toussaint-Langenscheidt, and the book is published by the Langenscheidt Publication House in Berlin-Schöneberg at the remarkably low price of 3.50 marks.

The "Deutscher Literaturatlas," by Dr. G. Koennecke, is a handy compendium of the author's great three-volume standard work entitled "Bilderatlas zur Geschichte der Deutschen Nationalliteratur," which has already appeared in a third and much enlarged edition, containing no fewer than twenty-two hundred illustrations. The condensation now offered is well done, being confined in its 165 pages folio to those essentials which the average student of German literature needs and will peruse with benefit. It covers the whole ground from the Gothic and the old High German down to such modern writers as H. Hesse, O. Ernst, G. Frenssen, etc., including also the story of manuscripts, Incunabula, book illustrations, pseudonyms, etc. It contains 826 illustrations, portraits of such prominent literary characters as Goethe, Schiller, and others being given in considerable number. The literary and biographical matter is critical and impartial.

The veteran historian of Bonn, Oskar Jäger, having completed his comprehensive "Deutsche Geschichte," has issued the first of the two volumes proposed, a book of 668 pages, with 114 illustrations and 7 maps

(Munich: Beck'sche Verlagsbuchhandlung). It deals with events prior to the Peace of Westphalia; and its varied engravings, the personal selection of the publisher, show the value, for research work alone, of such historical museums as that at Nuremberg. Jäger recalls the observation of Ranke, that to write history one should have lived long and experienced much, and rejoices in his own personal recollections, not only of the stormy days of 1848, but of participation during war and peace in the remarkable transitions of modern Germany. A pleasant, familiar tone pervades this new work of Jäger, and it is likely to find as much favor as his noted "Weltgeschichte."

"La Perduta Gente," the title of a new book by Richard Voss (imported by G. E. Stechert & Co.), though suggestive enough, hardly intimates that the little volume contains a valuable study of the Roman Campagna and its people. Reading the autobiographical sketch of the author, which serves as a fitting introduction to these reminiscences, one cannot help feeling that it is a long way from the selfish pessimism of his "Scherben gesammelt von einem müden Manne" to these intimate and sympathetic studies of the common people, fighting hunger and malaria in the marshes of the classical soil and hopelessly entangled in the meshes of mediæval superstition. The fatalism with which these people accept the fact that they must either starve in their native province or be consumed with the fever while working for their living in the poison-laden atmosphere of the swamps, gives a dismal note to the sketch from which the title is derived. It deals indeed with a doomed people. A remarkable study of homicidal types is symbolically entitled "Der rote Streifen." For the scarlet stripe, which the author perceived in the dusk of a summer evening moving along the road between Albano and Rome, was a procession of convicts clad in red from head to foot, who, with clanging chains, do the labor of draining marshes and building roads. Vividly rises the portrait of the "witch" from the pages devoted to a record of the lamentable ignorance of the people and the cruel indifference of the clergy to be observed at Subiaco. The tourist who loves Italy too well to be content with knowing only one side of its life, will find in this book close and direct information tempered with human sympathy.

"Facts are good, of course—give us plenty of facts; principles are good—give us plenty of principles"—this thought from William James is the motto of Dr. Fritz Ohmann's new work on the rise of the postal service in Germany: "Die Anfänge des Postwesens und die Taxis" (Leipzig: Duncker & Humblot). It contains a review of the modern German post office, and an effort to trace its origin in France and the Southern countries. A voluminous amount of data dealing with German postal affairs from 1489 to the beginning of the sixteenth century is presented. It is interesting to note that the main influence came from Italy, and that England, later so progressive in postal affairs, seems to have affected Germany but little until near the days of the Postal Union.

From London comes the report of the death of James Edmund Vincent, journalist and author, at the age of fifty-one. His publications include the following: "A History of Football" (with M. Shearman), "Tenancy in Wales," "Discontent of Working Classes," "Memoir of H. R. H. the Duke of Clarence and Avondale," "Welsh Land Question," "A Memoir of John Nixon, Esq.," "Highways and Byways in Berkshire," and "Through East Anglia in a Motor Car."

MRS. VAN RENSSELAER'S NEW YORK.

History of the City of New York in the Seventeenth Century. By Mrs. Schuyler Van Rensselaer. Two volumes. The Macmillan Co. $5.

Mrs. Van Rensselaer's volumes carry the story of early New York only to the accession of William and Mary, in 1689, but the character of the period is such that they may properly be considered as a unit in themselves. There has long been need of such a work as is here attempted—one which should not only embody the results of the most recent investigations in the earlier period of American history, and make use of the large amount of documentary material relating to the province which has been brought to light during the last few years, but which should also correlate the early history of New York with that of the other European colonies in America. The day has passed when the development of any one of the colonies can be isolated and treated by itself, or when the significance of events can be understood by taking America, rather than Europe, as the standpoint. With some qualifications which will be referred to presently, Mrs. Van Rensselaer has, we think, met this test in a highly satisfactory manner, and has produced a work which no student of the period can afford to neglect. The canvas is admittedly large and the landscape broad; she has been at pains so to survey the course of events in Europe and America as to make clear the position of New York as a centre of European influence on this continent; but she has done this without allowing the general to overshadow the particular, or to become a mere padded background against which to exhibit the more interesting details of the city's life.

Mrs. Van Rensselaer's use of authorities, as shown by her text as well as by her bibliographies, seems to have been commendably thorough. She is the first writer to make fundamental use of the "Minutes of the Common Council," edited by Professor Osgood; the recently published "Van Rensselaer Bowier Manuscripts," and the mass of material gathered in the reports of the State historian; as she is also the first to draw upon Professor Osgood's monumental "History of the American Colonies in the Seventeenth Century." That the records of the Dutch West India Company, prior to 1700, with their priceless data for the history of the city, should have been sold as waste paper at public auction in 1821, is a melancholy illustration of the fate which has overtaken more than one collection of sources even in this country, and which may yet befall invaluable records now in the custody of New York and of other cities, unless better means for their preservation and publication are before long taken.

We have come to expect that a history of a city, however large a place in commerce or politics the city may have held, will contain a considerable percentage of purely antiquarian lore. In these days of patriotic ancestor-worship, the writer would be brave to the point of rashness who essayed an elaborate account of his own community without finding place in it for notices of leading families, the location of early buildings, streets, and house lots, and other entertaining details. Mrs. Van Rensselaer knows her audience too well to do the unexpected, but to her credit it must be said that she has kept this fascinating but dangerous material well in hand, and has not allowed it to overweight her main narrative. Her interest, in other words, is in history rather than in biography; and while few notable families of New York who can trace their ancestry back to the Dutch period fail of appropriate notice in these pages, it is as essential factors in the development of the community, and not simply as individuals, that they for the most part appear.

Naturally, it falls to Mrs. Van Rensselaer's task to correct more than one time-honored error of the historians, such, for example, as the statement, repeated by no less an authority than John Fiske only a few years ago, that Argall in 1613 received the submission of a Dutch governor at Manhattan, when, in fact, it was nearly ten years before there was a West India Company in Holland or a Dutch governor in America. Nor was the purchase price of sixty guilders with which Minuit acquired the island of Manhattan so ridiculous as has often been represented, considering that land was the one thing of which the Indians had enough and to spare, and that the amount was actually paid, not in money, but in commodities to which the Indians attached great value. So, again, the notion that the patroon system established feudalism in the province, or had anything in particular to do with the eventual overthrow of the Dutch power by the English, must at least be greatly modified. As Mrs. Van Rensselaer points out (Vol. I, p. 93), the New Netherland patroonships were seigniorial, but not feudal, properties; their owners were presently empowered to sell or devise them; the grant of them carried no military power, and their people were not serfs, but tenants; while

as regards their influence upon the history of the province, it is to be remembered that they did not multiply or flourish, and that only one really prospered.

That New Netherland did not thrive as did the neighboring English plantations was due in part to the fact that the West India Company, though holding the best geographical site for the development of trade, never attained to any conception of a colony save as a source of immediate wealth, suffered from no competition at home, and continued its policy of control throughout the period of its existence practically unchanged, notwithstanding that the English companies, though not in general more intelligent at the outset, did not hesitate to alter their policies when they proved "economically undesirable"; and to the further fact that economic and religious conditions in Holland did not necessitate emigration. While the ecclesiastical policy of Charles I and Laud was sending thousands of Puritans to America, "the West India Company was trying to people its province from a land where men were free and content; and to this land every dissatisfied settler was eager to return" (Vol. I, pp. 112-113).

Mrs. Van Rensselaer gives much space to tracing the relations, rarely friendly and on the whole increasingly hostile, between New Amsterdam and its English neighbors. In an interesting passage (Vol. I, pp. 300, 301) she points out that Bancroft, and other writers who have followed him, are in error in ascribing to the large immigration from New England, between 1640 and 1650, the rising demand of New Netherland for self-government. "Neither the *Petition* nor the *Remonstrance* of 1649 is tinged with English ideas"; on the contrary, the Dutch themselves, in demanding "burger-government," were in reality asking for something which, however unfamiliar to the Englishmen of the day, meant to them a larger measure of self-government than Englishmen then enjoyed. Doubtless, the origin of political ideas in any community is hard to trace, and we cannot but suspect that Mrs. Van Rensselaer somewhat underestimates here the influence of contemporary English thinking, though it must be confessed that the prevailing attitude of the English in New England towards their Dutch neigbbors did little to cultivate a favorable soil for the reception of English ideas. Whatever the origin, however, the rapid working of the notion of freedom from home control has many illustrations in these pages. In 1653 the delegates summoned by Stuyvesant drew up a statement of grievances, in which they virtually denied the right of the company to govern the province, on the ground that conditions in the colony were different from those at home, and that in consequence the people should have a voice in the making of the laws.

That Stuyvesant should have regarded the pretensions of the delegates as preposterous was to be expected, but his invincible opposition to popular government does not blind Mrs. Van Rensselaer to his virtues as governor, or modify the vigor of her protest against the gross caricature of him, and,through him, of the community and its people, for which Irving is to be held responsible. Of his incessant activity, albeit in a losing cause, and his zeal for the development and defence of the colony notwithstanding the ignorance and apathy of the company and its increasing political embarrassments at home, her narrative offers convincing proof. Instead of declining under his administration, the city prospered. The population of the province, in 1660, though small in comparison with that of the English colonies, had quintupled since the departure of Kieft, thirteen years before, and was more than half again as large as that of Canada. There was gratifying extension of the settled area, with the planting of new towns; and in 1657 New Amsterdam was granted the "burger-right" which Chancellor Kent reckoned as, in a limited sense, a city charter. The population had good quality, too, notwithstanding its cosmopolitan character. To be sure, the people were not predominantly of the high type which had flowed into New England, but neither were they of the varied moral quality which was also a characteristic of the English colonies.

Of the war which transferred New Netherland to English control, Mrs. Van Rensselaer gives a lucid and detailed account, with especial reference to the commercial conditions which were so largely responsible for it. Nichols proved himself an able administrator, in spite of his youth and inexperience, treating the colonists liberally and keeping his word with them. The career of Dongan, which is also carefully followed, belongs as much to the province as to the city; but in the account of Dongan's relations with the governor of New France, the author has a chance to show her acquaintance with the less known aspects of the subject, and makes a welcome addition to the rather scanty volume of systematic information about the intercolonial diplomacy of the time. Recent studies of the Andros administrations have gone far to rehabilitate the memory of a man who to early historians was anathema, and Mrs. Van Rensselaer's presentation, while adding little that is new, confirms the more favorable impression.

Nearly half of the second volume is devoted to the Leisler period. The evidence, submitted in unusual detail, makes it clear that Leisler, though ignorant, conceited, and rash, was not in the ordinary sense of the term a usurper, and least of all a man who intended a permanent opposition to the English government at home. Thrown to the front by circumstances which he did not create, the spokesman of a widespread body of opinion rather than the originator of a revolutionary idea, he took control of affairs at a time when only a strong hand could have prevented disaster, won at least a formal submission to his authority within the city, and fell because, overborne by pride at his success, he resisted an authority which, as mere matter of policy, it would have been well to recognize. Whatever his motives, and however distorted his judgment, the arbitrary exercise of power for his own aggrandizement was not one of his ambitions. Mrs. Van Rensselaer's judgment upon Sloughter, whose alleged drunkenness has commonly been made the lame excuse for his action in signing Leisler's death warrant, is a good example of the restraint with which she treats controverted questions:

> Probably he had been sober when he asked the council whether the delay of the execution of justice "might not prove dangerous"; and it may be thought that a seasoned soldier recovered his senses between the Thursday evening when he signed the warrant and the Saturday morning when the prisoners were hanged. The real responsibility for the execution, legalized murder or lawful punishment, as it may be considered, must be laid in equal measure upon Sloughter and his five advisers, the five who were present at the council meeting on the 14th—Bayard, Van Cortlandt, Philipse, Nicolls, and Minvielle. No one could have compelled a Governor to speak as Sloughter then did; and no Governor could have ventured so to speak and to act without the hearty sanction of a quorum of his council (Vol. 2, p. 560).

Where there is so much which calls for strong commendation, and where a work as a whole is so obviously a notable addition to historical literature, it seems ungracious to make more than passing allusion to respects in which the work might have been better than it is. We feel compelled to say, however, that the weakness of Mrs. Van Rensselaer's work is its superabundant detail. One proof of the success of a book is that it is read, and we seriously fear that few of the many who will begin the reading of these two stout volumes will persevere to the end. While all that Mrs. Van Rensselaer has to say is important, it is not all equally important, and a judicious pruning away of a fourth part of the details would unquestionably have improved the quality of what was left. Detailed as it is, however, the book is a notable piece of work, honorable alike to its author and to the city whose story it authoritatively sets forth. It is sincerely to be hoped that the remaining two volumes, intended to cover the century from 1689 to 1789, may not be long delayed.

CURRENT FICTION.

The Battle. By Cleveland Moffett. New York: G. W. Dillingham Co.

From the literary point of view this is simply a good specimen of that queer, clumsy mongrel species, peculiar to our time, the novelized play. The common order is reversed; for it is a natural process to dramatize a novel, to precipitate the crystal of a play from the vague fluid of narrative and exposition. But to "novelize" a play is, as it were, to resolve that crystal into a dew: a task difficult almost to the point of impossibility. As a matter of fact, the attempt is commonly not so much to make a *bona-fide* novel out of the given dramatic material as to give the play a wider audience. A similar office may be performed by moving pictures. It might seem, to be sure, that the natural thing would be to print the play: this is done now and then, but is, we believe, a doubtful adventure for any publisher. The lack of scenery and costume and player with his personality, of orchestra, of jostling fellow-auditor, must be made up for roughly by devices of description. The great (with us chiefly feminine) reading public does not read plays unless coated with the sugar-frosting of fiction.

Note Mr. Moffett's experience. His play, called "The Battle," was produced in New York last December. It "not only met with success, but stirred up violent controversy"—success itself, from the manager's point of view. "Various publishers" now urged him to make a novel of it, and we have here the result of their pleadings. The last thing they wanted was disguise of its quality as a play. We have the usual photographs of actor and actress posing in a flat stage-light more or less according to the specifications of the text. Those compressions and annihilations of time and space which we accept perforce as dramatic conditions are complacently adhered to. We readily understand why it must have been an effective and even meritorious play. It was, perhaps, a catchpenny device to make the leading person the "richest man in America," whose popular nickname is "John J.," but the treatment of the man as an individual and as a type is not trivial. Doubtless, the drama provoked controversy because people failed to agree as to what it meant: a not unhopeful indication of health in such a play. "John J." is not made out a monster. He is allowed to put his philosophy of life very strongly, and comes out, in a way, victorious. Philip the youthful enthusiast, and Gentle the Socialist are equally human, and if they also are victors in the battle, it is also only "in a way." No panacea is offered for the quick adjustment of the difficulties between poverty and wealth, unless it be that every man, rich or poor, must "learn to do his loving himself"—a panacea at least two thousand years old.

The Glass House. By Florence Morse Kingsley. New York: Dodd, Mead & Co.

This is a story of a confirmed wife, mother, and houseworker, weary but well-doing, who was hunted out by an old college classmate and persuaded to be sorry for herself and to take to literature. It is hardly conceivable that the mother of a twelve-year-old child should be so unstable of habit as to forsake the frying-pan for the inkstand. To find the story convincing is to believe that a mature and highly domesticated woman may suddenly go blind to home interests; may abandon even ordinary vigilance over her children, and may fail to live up to even a rudimentary code of professional honor. Great trouble, almost disaster, followed in the wake of Mrs. Loomis's pen; but rescue came in an unexpected fashion, and the house of Loomis stood once more four-square to the winds.

Its patron sinner, the woman who loved to be an "Instrument" of others' development, is just such a combination of the kindly and the meddlesome as is sometimes seen in real life, blundering along amiably and perniciously. She is perhaps the most credible portrait in the book. Upon her pudgy mind the ignoring of professional integrity sits not unnaturally. Her husband, the bad man of the plot, impresses one as being rather over-weighted with malice towards beings already down in their fortunes. However, as he provides the almost achieved melodrama, he must be tolerated. A touch of imagination informs the figure of the "poor, prodigal of a fellow" whose coming to the help of youth and innocence clears the murk from his own life and makes him a man. Youth and innocence, in the person of Louise, are startlingly selfish, greedy, and mendacious. Was there no saving preparatory influence in her mother's constant companionship during the twelve years before the flood of ink? And that mother a college graduate, accomplished cook, and seamstress!

"Mothers, beware of becoming short-story writers and novelists!" is the moral of the fable. If the moral is not loudly demanded by the public, the fable at least is mildly readable.

Diana Enthroned. By W. M. Letts New York: John Lane Co.

The charm of this book is that it refuses to be classified. A story set in English country life, it is not a story of that life. A society woman or two fail to make it a society novel. The familiar situation of an eagerly adoring husband and a placidly tolerant wife takes a shape quite out of the ordinary. Even the ancient and honorable tactics of the conveniently dead tactlessly turning up alive are directed away from the obvious. If the story is to be labelled at all, it would have to be called a human-nature study. Not even a character study, for Phoebe and Robin, playmates from childhood, have no particular emphasis of character, but are vividly, shiningly endowed with what can only be called being. A faun he, a Diana she; yet a faun with extremely human faults, a Diana with a kindness that makes her almost religious, albeit she is thoroughly a pagan. Out-of-doors, horses, dogs, and children are the gods she worships, tenderness to the weak the mainspring of her life. This is it that controls her loves and her coolnesses and that captures and holds alike the weak Robin and the strong Hugh.

The story opens with the birth of Phoebe and the dedication of her by an unhappy mother to Diana, that she might be a child of nature and might not love mortal man. She forgot Endymion; and Phoebe lived to pass through life as other Dianas do. All that goes to make the enveloping atmosphere of field and garden and open, skyey country is agreeably unconventional. Glints of wit and humor are not lacking. A little worldliness invades the pastoral. Wisdom and even piety have their say in wholly unaffected fashion. The threads of the tissue are drawn together just a little loosely, but the interest does not die out.

The Show Girl. By Max Pemberton. Philadelphia: John C. Winston Co.

Though the writer of this story has a good deal to say about the absurdity of the Anglo-American attitude toward the life of Bohemian Paris, he does not disdain to take advantage of that attitude. His tale is squarely addressed to the audience which loves to hear of students' balls, cocottes, grisettes, and the Moulin Rouge. It is not a story of stage life. The heroine is a "show girl" in a very general sense, and her public career—not much of a career, at best—is of little account in the narrative. What is of account is the Bohemian atmosphere, the devil-may-care mode of progress toward a foregone conclusion. The deviltry, to be sure, is seen in the end to have pretty much confined itself to wine and song—an innovation in this kind of story. The hero, a young English sculptor *in velle*, is, with all his nonsense, a person of uncommon virtue, and so is the "Mimi" whom he rescues from the hands of a certain cheap showman by the simple method of buying her. She had been guilty of no such shocking if natural complaisance as Trilby's—a fact which we are encouraged to attribute to her noble birth. The incidents which precede the final and comfortable union of the virtuous pair need not be recounted here. They are

of that amiably adventurous type which will survive in popular fiction to the end of time. The tale is told in the form of letters, and loses nothing in vivacity thereby.

The Function of Religion in Man's Struggle for Existence. By George Burman Foster. Chicago: The University of Chicago Press. $1 net

The title of Professor Foster's apologia for theological liberalism cannot be justified either by the contents of the book or by its method. It suggests that scientific models are kept in view: as a matter of fact, its discussion of religion is more rhetorical than scientific. Often the rhetoric is extremely effective, and is the vehicle of sincere conviction. It will be listened to because in many places the book voices the feeling of the present day in its opposition to religious traditions and to the organizations which uphold them; but the failure to meet the demands of scientific accuracy can be illustrated on almost every page, perhaps nowhere better or more concretely than in the definition of religion as "self-effectuation." This phrase is typical; it reveals the contradictions in which such a work is involved by its attempt to discover analogies between biological science and religion. What product of history, individual or social, could not be called "self-effectuation"? It is no more an accurate description of religion than it is of Roman law or a mediæval cathedral. The whole theory here expounded of the origin, place, and development of religion can throw little light on the actual facts of racial religious differences or on the varied forms of religious consciousness generally. The struggle for existence as it has been worked out in the field of both civilized and savage mankind cannot be put in the terms of physical or biological science without the sacrifice of essential factors. If Professor Foster had ventured anywhere to come to close quarters with any of the great religions of the world as they have been expressed in doctrine, conduct, or administration, he would have seen his inability to account thus for either their successes or their failures.

By this false terminology a suggestive idea is spoiled. The writer's purpose is to protest against a mechanical theory of inspiration that pictures man as an inert receptacle into which divine truth is conveyed by some extraordinary act of Providence. He wishes to rescue the subjective element in religion and to show that religion is a human product adapted to and created by man's needs. At the close of his book he speaks plainly, without using biological terminology, of the difficulties now facing all Christian churches through the assured results of criticism and history. He even goes so far as to minimize the influence on Christianity of a possible demonstration that Jesus Christ never existed, though he is careful to state that he himself accepts the historical reality of Christ. Yet it can hardly be said that the Chicago professor of theology shows more daring here than the Roman Catholic Modernists. The interest of his position is that by pleading for freedom of research and also for freedom of expressing popularly the results of research, he has brought down upon himself the anathemas of his co-religionists. His words on this point deserve attention not only from the churches, but from those without the churches who respect Christian civilization and reverence the influence of Christian lives. Professor Foster is undoubtedly right in maintaining that church organizations cannot afford to alienate the seeker after truth. It is a temperament which accords with Christian ideals; the goal is of less importance. The whole subject of the standards of membership in Christian churches needs to be fearlessly handled. Professor Foster's case is not an isolated one. He believes in the Church as a Christian community, he recognizes the work it can do, and yet his tenure as a Christian is made uncertain simply because an attempt is made in our own day to apply regulations of loyalty which grew up when Christendom was divided into a collection of ecclesiastical camps, hostile to one another and convinced that the sole way of protecting their own interests was to secure absolute uniformity of doctrinal statements among their adherents.

The Wander Years. By J. H. Yoxall, M.P. New York: E. P. Dutton & Co. $2 net.

This is scarcely a book of travel, although the "journeys into life, letters, and art" are often connected with actual journeys into France, Germany, Switzerland, and Italy. Mr. Yoxall's avowed purpose is to portray his travels "through the present and into the past; amidst hoary white civilization, eschewing the ugly new; into Green Vaults and Festspielhausen, Bodleians, Alt Pinacotheks, and Salons Carré (*sic*); into the proudest Parliament; into cabinets of thought and foyers of action, labyrinthine streets of the city of Mansoul, and calm domains of Academe; best of all . . . into lenient pastures of pity and aid and pardon." Those who have the courage, after this warning, to follow the wander years will not be wholly unrewarded.

The essays which centre about France contain Mr. Yoxall's best work. It is a disappointment to find him mounting a "snorting and pawing" automobile in the Bois de Boulogne, after he has shared with Dickens the diligence to Avignon and, not only imaginatively, has "tramped" over many of the "rising and falling roads." But he still, in successful moments, reproduces something of the physical charm and of the temperament of "old France." Essays of another kind range from a gallant defence of Madame de Warens to a regretful picture of Lottchen on the Loire, and from the soul of a Cathedral to the rose on Billingsley porcelain. Each subject has numberless points of contact. A few essays, especially the one "to Mr. and Mrs. Bull," are quite unredeemed by the appreciative knowledge of the good in art and letters which makes it possible to endure the malformed style of the entire volume. The "exotic" words for which, in the preface, the author is willing to go to the stake are few. Nor is any one likely to cavil at the frequent and unitalicized French. An apology was rather needed for lapses into vulgarisms and banalities. But the chief defects of Mr. Yoxall's style are not found in his vocabulary. Grotesque imitation of Thackeray and Lamb (whom he actually calls "the merriest of the lambs") is an evil fruit of his admiration for the older masters. And in his reiterated praise of the "wandering fire" affectation takes the place of the vivacity of the greater vagrants. The most vigorous single paragraph in the book, and autobiographically the most interesting, pictures a boy reading Gessner's "Death of Abel" on the slippery horsehair sofa of a mid-Victorian parlor in which lingered "the ghosts of numberless dull Sundays." It is a pity that when Mr. Yoxall discovered that life can be "ode and epode, alcaic and sapphic, epic and elegy," he did not submit his wander spirit and his "bit-between-the-teethy" pen to inherited rigor and discipline.

The East End of Europe. By Allen Upward. New York: E. P. Dutton & Co. $4 net.

In one sense, Mr. Upward's excellent contribution to our knowledge of Macedonian history during the last ten years, though published a very short while, is already belated. It will be recalled that the Macedonian problem, in its most critical aspect, had to do with the struggle between the Bulgarian and Greek nationalities for a predominant position on the Ægean, carrying with it the right of succession to the Sick Man of Europe's holdings when that erratic invalid was finally bundled across the Bosphorus into Asia. In Macedonia, the Bulgarian and Greek bands preached their respective gospels with fire and sword. British and American opinion undoubtedly inclined to the side of the Bulgarians. This would seem natural enough, ever since Gladstone took the latter under his special protection. Now, it is asserted by Mr. Upward that Greece has been sadly misunderstood in the

matter. Bulgaria, by clever manipulation of foreign opinion, has succeeded in creating the impression that her rights in Macedonia are sounder than they really are. Mr. Upward draws up a brief for Greece. Since he states his position frankly at the outset, there is no fault to be picked with the tone of the book. He shows an intimate acquaintance with the details of a badly-tangled problem, makes lavish use of documentary evidence, and altogether shows himself one of the best equipped writers on the subject.

In calling the book belated, we had in mind the fact that for the present the Macedonian problem has become merged into the new situation in Turkey. The civil war in Macedonia has ceased. The disappearance of the Ottoman rule seems no longer imminent. Neither Bulgaria nor Greece has, of course, given up its ambitions with regard to Macedonia, but when the conflict revives, if it does revive, it will bear a different character. Nevertheless, Mr. Upward's account of racial and economic conditions in the disputed region should be of value for a long time to come.

The Effects of War on Property. By Almá Latifi. New York: The Macmillan Co. $1.50 net.

This is a collection of studies on the effect of a state of war upon property in its various forms. After considering the property of enemies and neutrals on land, the effect of conquest upon property, the property of enemies and neutrals at sea, and exceptions to the rule of capture at sea, the author comes to what, we suspect, is the topic of chief interest to an Englishman at this time —the inviolability claimed for private property from capture at sea. He treats briefly the history of this doctrine from the time of Mably and Vattel, and then shows that in the practice of nations the doctrine is not yet accepted. The abstract arguments in favor of the innovation he examines and finds wanting, while those against it he pronounces conclusive. The entire question, he concludes, is "one of political expediency, to be decided by each state after a consideration of its own especial circumstances." After reviewing the circumstances of England, he contends that that country, if it accepted the innovation, "would be a distinct loser as compared with the Continental nations that are so eager for a change of the law."

Mr. Latifi is good enough not to doubt the "humanitarian motives" of many advocates of the inviolability of private property at sea, but remarks that the policy of nations is based upon self-interest, not upon "abstract principles preached by professors or embodied in resolutions of peace congresses." From this and other expressions we conclude that the volume was intended as a courteous British greeting to the International Naval Conference in London. Professor Westlake cordially seconds the greeting by contributing an appended note in which he thoroughly demolishes the "topsy-turvy" notions of the expected guests.

Science.

Little Busybodies: The Life of Crickets, Ants, Bees, Beetles, Etc. By Jeannette Marks and Julia Moody. New York: Harper & Bros. 75 cents.

The first thought of a reviewer on taking up a book of science for young people is likely to be that it requires brief consideration. However accurately this may express a common opinion, it certainly falls short of conveying a truth. For no book can be more important than one that has to do with the formation of young minds; and that books of science adapted to the young have done much to determine the career of some men who now occupy leading positions among teachers of science, the writer hereof knows. Moreover, there is no class of books whose composition requires greater skill than such as this study of "Busybodies." The authors are teachers in Mt. Holyoke College, and their profession has plainly given them a happy control of the art of lucid expression. Under the admirable direction of an experienced guide, who is also a well-informed naturalist and practical entomologist, a small miscellaneous group of children, during a summer vacation in the mountains, is brought into close relations with some of the common and most interesting insects. The old guide succeeds in telling what he knows in a way that both interests and informs. The incidents of camp-life and the play of various characters help to keep the interest from flagging. The whole assemblage of incidents and facts is well managed and falls naturally into the authors' purpose. The technical knowledge conveyed is accurately as well as pleasingly given.

There is really nothing to criticise seriously, only here and there a questionable slip. It is hardly allowable today to class spiders with their "sparkling fairy webs spun anew for us every morning," among insects; although it would have passed muster less than a century ago. Nor is it quite correct to speaks of "ants carrying grains of sand as far from their doorways as possi ble." It is a traditional belief that the curious little neuropterous grubs, known as Myrmeleon, or ant lions, "throw up sand over their heads in order to hit a helpless little ant and knock it down into the pit." But one who has carefully observed the grub will hardly give it credit for a purposeful bombardment of that sort. The sand is, indeed, thrown up to make a runway down which an ant may slide into its jaws; but when it occasionally hits its prey, this seems to happen purely by accident, and the hitting appears to have no effect in the way of "knocking it down." But such slight lapses from the strict facts are rare; and the book is to be commended as generally trustworthy.

The illustrations are for the most part rather crude, though generally sufficient for the purpose. However, it ought to be remarked that such a picture as that of the ant lion's pit opposite page 78 is scarcely reputable drawing.

Dr. C. W. Saleeby has apparently abandoned the pill and scalpel for a pen whose ink flows freely and a blue pencil which he uses wisely in editing an admirable series of treatises on medical topics of value to the general reader. His own publications are becoming numerous. The last, entitled "Health, Strength, and Happiness" (Mitchell Kennerley), is alleged by a subtitle to be a book of practical advice, and is declared to teach a new asceticism concerning the care of the body, with a just regard to the importance of the mind. The book concerns itself chiefly with grown-ups, children being a fascinating subject to be taken up at another time. For a similar reason, the book is almost sexless, since certain momentous questions relating to women are reserved for consideration in a separate volume. Much attention is paid to the middle-aged man who is just going down hill when he need not, and who ought to be ashamed of his decline. Fresh air, much light, loose and washable clothing, sensible shoes, much and easy sleep, are the more important agencies to help him and others. Work, free from excitement, is not harmful, and particularly not a cause of sleeplessness, insomnia being often merely a result of indigestion. As to exercise, Saleeby is a skeptic, holding muscular development to be of little importance, and the best exercise that which we enjoy, and having little respect for gymnasiums and none for bedroom apparatus for this purpose. All these and many kindred matters are discussed pleasantly and almost too diffusely, so much so that the reader, while sure of entertainment, is often uncertain just what the author really believes and advises, and why. As a whole, the book is suggestive and likely to help many to whom a more exact treatise would be unwelcome.

The publication of the complete works of Alessandro Volta is now assured by the action of the Italian government in contributing $3,000 towards the necessary expenses. A committee appointed jointly by the Reale Istituto Lombardo delle Scienze and the Reale Accademia dei Lincei will have charge of this edition, which, it is expected, will consist of five volumes, and be finished within two years.

Houghton Mifflin Company will publish this autumn "Preventable Diseases," by Dr. Woods Hutchinson; "The Elements of Military Hygiene," by Percy M. Ashburn, and "Astronomy from a Dipper," by Eliot C. Clarke.

Eugen von Gothard, the Hungarian astronomer, has died at the age of fifty-two.

He made a number of astro-physical and astro-photographic studies in an observatory at the family seat at Herény.

Drama.

THE REPERTORY THEATRE IN ENGLAND.

The announcement, some weeks back, that two repertory theatres are shortly to be started in London, one to be directed by Herbert Trench with an influential backing, the other under the management of Mr. Frohman with the coöperation of the following authors: George Bernard Shaw, Granville Barker, J. M. Barrie, and John Galsworthy, marks the turning point in the fortunes of the movement that has been actively propagated for the last twenty years. It is about twenty years ago that the first performances of Ibsen's plays were given in London, a period when William Archer, our leading dramatic critic, was, almost single-handed, championing the work of that great European dramatist against the virulent abuse and active prejudice of most of the prominent organs of the London press. The audiences were enthusiastic, but small, and from that day to this the rare Ibsen performances we have had have only brought to the theatre doors the relatively small public of highly cultivated, artistic, and progressive people who are capable of thinking for themselves. Had William Archer's name been prefixed by Mr. Frohman to the list of his four "coöperators," we should, indeed, see the main links in the historical chain of the repertory theatre movement. For Mr. Archer's teaching begat Granville Barker's practice, and without Bernard Shaw's sustained attacks, both in his criticisms and his plays, on the conventional ideals, the sentimental falsities, and worm-eaten traditions of the British drama, we should have had no Court Theatre, and without the Court Theatre John Galsworthy's modern plays, "The Silver Box," "Joy," and "Strife," would scarcely have been staged. J. M. Barrie is the only man of the five who, while taking a line parallel with the course steered by the others, has remained independent; but that Mr. Frohman's repertory theatre would not come into being without Mr. Barrie's own inspiring example and striking dramatic successes—for this we have Mr. Frohman's own declaration in the London *Times*.

The repertory theatre movement is, in theory, and let us hope it will prove in practice also, a reversal of the commercial policy that has strangled our British drama for several generations. Long ago a French critic remarked that the drama declined from the day that large theatres came into being, and the mediocrity of the Victorian drama certainly coincided with the system of large theatres, high rents, and long runs. The triumph of the popular commercial drama was a by-product of the economic developments that witnessed the destruction of scores of beautiful, old-world handicrafts by the competitions of the new, cheap manufacturing processes. The system, in drama, acted automatically to exclude all work of fine original quality that was not, and could not be, a "popular success." William Archer in 1896 wrote:

> Suppose that a playwright of genius comparable to Mr. Meredith were to appear among us to-morrow, what would be his fate? After weary years spent in bandying to and fro a brown paper parcel shuttlecock, and in playing battledore with the actor-managers, he might possibly get one of his plays produced. It would attract very little attention; a few critics would praise it warmly and he laughed at for their pains; . . . it would be withdrawn, and the dramatic Meredith would be not only depressed, but annihilated by his failure. . . . The managers would steadfastly refuse his other works. . . . In short, his talent would be absolutely and hopelessly gagged. . . . In either case the sum-total would be a genius wasted for want of a very simple mechanism to enable him to seek his public and his public to find him. . . . This is precisely the situation of the British dramatist. . . . On the other hand there exists beyond all question a public within the public. . . . The Repertory Theatre, which must at first to some extent be an endowed theatre, is required to afford a meeting-place for the artist-playwright and the art-loving (as opposed to the mere show-loving) public.

That Mr. Archer did not overstate his case may be proved by a simple comparison. All literary critics are agreed that the Elizabethan drama was representative of Elizabethan culture, but nobody can pretend that the Victorian drama was ever representative of Victorian culture. Compare the list of our great Victorian novelists and poets with that of the contemporary dramatists. We find the dead "poetic drama" of Talfourd and his school, two or three clever, garish plays by Lord Lytton, a few pseudo-realistic "dramas with a purpose" by Charles Reade, plays of the "teacup and saucer" school of Robertson, the plays of Mr. Pinero and Henry Arthur Jones. These are the flowers of the Victorian drama blossoming amid the interminable thicket of deadwood, the sensational, sentimental, meretricious vulgarities false to life and false to art, that have filled the play-bills of the last sixty years. Clever actors, of course, can do wonders with topical plays, with plays of the "cape and sword" school, with comedies that exaggerate the humors of life, with plays that parody fashionable life. I do not wish here to cast any reflections on the great uncritical body of playgoers for whose tastes our British actor-managers, with scarcely any exceptions, have catered, for the last two generations: I only point out that the average drama of the commercial theatre, in point of view of art, of intellect, and of permanent human interest, has been far below the corresponding standards of the average marketable novel. Even the Shakespearean drama has been falsified and cheapened by an actor-manager placing the emphasis on its spectacular instead of its great human appeal, and this through the agency of "large theatres, high rents, and long runs." I except, of course, the revivals by a few great actors, such as Macready and Henry Irving, and the special work done by the Benson Company. How fatal the actor-manager system has been to the English stage is, moreover, shown by the extraordinarily meagre list of representations of classic and Shakespearean drama. Very few of Shakespeare's plays are ever performed in London. The best performance I have seen in twenty years of "Twelfth Night," barring Henry Irving's, was given by the children of two clever families in a Surrey village. The great tragedies of "Othello," "Macbeth," "King Lear" have not been adequately acted within the memory of our generation. The chief Elizabethan dramatists — Shakespeare excepted—have never been "revived" in the commercial theatre. Congreve is acted not once in five years. And so on, and so on.

The admissions made in the rival manifestoes of the two projected repertory theatres are indeed an indictment of the commercial drama: (1.) *The Young Dramatists:* "A Repertory Theatre," says Mr. Frohman, "should be the first home of the young dramatist. I beg of him to be done with the theatrical, and write only of a life that he really knows." "It is hoped," says Mr. Trench, "that the new management will be able to give the most generous opportunities to young English dramatists." (2.) *The Drama as an Art:* "Under our new system," says Mr. Trench, "it will be possible to produce masterpieces by dramatists of the first rank which would never see the light in a long run." (3.) *The Bill of Fare:* "I want to interest the good play-goer, not once or twice a year, in what is being done at my theatres, but once or twice a month," Mr. Frohman states; and Mr. Trench informs us that "the 'play of ideas' will be varied also by selections from the best revived modern plays, and by classical plays, such as those of Shakespeare, and comedies of the seventeenth and eighteenth centuries." (4.) *The Public:* "In my opinion," says Mr. Frohman, "there are now in this country a number of people sufficiently large to be called the public, who wish to delight in the drama as an art." That is the all-important question. It is obvious

that the hope of a renaissance in British drama depends upon the number of the art-loving public being sufficiently large to give strong support to the appeal of "the artist-dramatists." Has this day really arrived? My answer must be in the affirmative, even though I am writing these words in the shadow of London.

Curiously enough, London, which, as the centre of the British Empire, should take the lead in all matters of vital reform, is always miles behind our other great centres in encouraging them. London, as the home of "vested interests," is the most conservative of cities; its overgrown size seems to paralyze the imagination of its citizens, its "intellectual" public is scattered and lost in the great wilderness of the suburbs. Manchester has known the highly successful repertory theatre of Miss Horniman's company of players, while London has been waiting for some manager to arise and carry on the splendid work accomplished in its Vedrenne-Barker performances at the Court Theatre, 1905-6. The Court audiences proper were broken up by Messrs. Vedrenne and Barker's move to the Savoy Theatre, where they failed to find adequate support. Since then the most promising theatre, in the way of encouraging the more original order of drama, has been the Kingsway, under the management of Miss Lena Ashwell; but her "forward" policy, I hear, has not of late met with paying results. The Irish National Theatre, started by Miss Horniman, and generously subsidized by her, has adopted an æsthetic programme of a special and somewhat narrow character, and the venture of her Manchester company, under the direction of Iden Payne, is of a more catholic and representative order. The performances of this company that I have attended in Manchester have been equal to the most brilliant performances at the Court. A finished unity of effect, a general harmony of tone among the players is practically never seen on the random stage, since the actors recruited under the "star" system, each time afresh for a new piece, are not controlled by an art director or producer who aims at the artistic balance of the piece as a whole, but by a manager who aims merely at the effectiveness of the leading parts. An art director should be the spiritual conscience of the whole company, he should know exactly what his players can or cannot do, and it is his function to interpret a given drama much in the sense that the painter interprets a given landscape. Macready and Henry Irving and other great actor-managers have aimed at this unity of tone in a performance, but the actor-managers as a rule have failed egregiously to secure it. But the other great advantage of the repertory theatre is that the players, accustomed to one another's methods, and called upon to enact a great many parts during the year, gain in intelligence and versatility, with the drawback, however, that the strain on the whole company and the art director is continuous and very severe.

That Mr. Trench's repertory theatre at Haymarket has been guaranteed ample financial support for a period of three years is the most satisfactory news that the "good play-goer" has heard in our generation. The commercial theatre will not and cannot afford to run risks in order to please the art-loving public; that has been demonstrated *ad nauseam*. The subsidized repertory theatre will take these risks in the hope of educating the taste of the average play-goer, and of teaching him to appreciate artistic standards he has not hitherto demanded. Of course, a great deal will depend upon the capacity of the art directors of the repertory theatres. In this respect Mr. Frohman is safe; Granville Barker is the best "producer" we have had on the modern stage. Norman McKinnel will enter on his duties at the Haymarket Theatre, under the Trench directorship, with the confident hopes of everybody. Iden Payne, the director of Miss Horniman's company, is, I am personally convinced, destined to play a leading part in the creation of a British drama worthy to be called drama.

Disappointments and setbacks there will, of course, be many. I am inclined to doubt whether the young, untried dramatist will meet with as much encouragement as the director of the new repertory theatres would seem to promise him. But we may expect that the standard of dramatic criticism, which, under the influence of the commercial drama, has been of poor quality, will gain in originality and insight. And this should react favorably on the standards of the ordinary play-goer; though I am bound to admit that the excellent literary criticism that now appears in so many of our leading London newspapers has had much less effect in improving the literary taste of the British public at large than one would have supposed. The last word must, however, be one of hope. The outlook for drama in the past three years has changed much for the better. After the prime minister's recent declaration in the House of Commons, we may surely hope that the ridiculous British censorship, which has so long paralyzed the freedom of outspoken serious drama, will be replaced by the creation of a sane authoritative body. The old view that the theatre is merely a place of amusement is giving way, slowly, but none the less giving way, to the idea that the theatre is one of the most potent instruments we possess for the aesthetic, mental, and moral instruction of the citizen. We must not expect that a great drama will come into being, for a modern public is not worthy of it. But we may expect that the theatre will be more representative of modern outlook and our modern culture than the Victorian Theatre was representative of our fathers' and our grandfathers' culture.

EDWARD GARNETT.

Art.

Señor A. de Beruete y Moret, the author of "The School of Madrid" (London: Duckworth; New York: Scribners) is the son of the well-known authority on Velasquez. In this study of Velasquez's contemporaries and successors at Madrid the son shows that he has inherited no small portion of the father's scholarly caution and critical acumen. The subject is on the whole an uninviting one. We have to do either with sheer imitators of Velasquez or with religious painters rather weaker than their Sevillian contemporaries. To be sure Cerezo, Cabazalero, Juan Rizi, and Antolinez express the ruling Jesuitical fervor with originality, shunning oversweetness, and retaining the dignity of real passion. Carreño, too, seems very nearly a master portrait painter in his own right. Mazo, at least, is a fascinating problem, being almost a great painter if Velasquez were away. While these copyists and eclectics are not intrinsically of the highest interest, the field is so little known and their works have been so frequently attributed to Velasquez, that Señor Beruete's pioneer work serves an obviously useful purpose. No chapter is more interesting than that on Mazo, the son-in-law and assistant of Velasquez. To him is attributed the remarkable portrait of Admiral Pareja, in the National Gallery, and the superb Prince Balthasar Carlos in the Riding School, at Grosvenor House. The first attribution is attractive, the second will, we fancy, hardly establish itself. Especially interesting is the treatment of Mazo as a landscapist. In this field Mazo struck out for himself and achieved independence. Otherwise he will be remembered chiefly for the trouble he has made as the faithful copyist and admirable imitator of his great father-in-law.

Señor Beruete's work is so scholarly and so serviceable that we regret to point out its obvious weakness—the failure to take into account Spanish pictures in America. At Montreal, in the New York Historical Society, the Metropolitan Museum, in the private collections of Philadelphia—to mention only obvious instances—there are many pictures that should have been registered. Setting aside the commoner royal portraits, most of which fall to Mazo, such pictures as the impressive St. John of the New York Historical Society—possibly a Cerezo, the spirited group by Mazo (?) in the Johnson collection, Philadelphia, and the romantic landscape by Collantes at Cottier's should be recorded and studied. The time has passed when a book of this sort can safely be written without a visit to America. And if European scholars find the journey impracticable, at least they should strive to make

their survey complete, through correspondence and collaboration with American colleagues. This book is well printed, and contains fifty reproductions of paintings, several of which are now first published. Mrs. Stuart Erskine's translation is excellent.

The Académie des Beaux-Arts has announced the result of the *concours* for the Prix de Rome. The Grand Prix goes to Armand P. G. Bodard, a pupil of Gabriel Ferrier. The second prize is awarded to Jean E. M. Tourné of Agen, a pupil of M. Cormon, and the third prize is taken by M. Merle, also a pupil of M. Ferrier.

John Robinson Tait, a painter and critic, died at his home in Baltimore, July 29, at the age of seventy-five. He was educated at Woodward College, Cincinnati, and at Bethany College, Virginia. In 1859 he went to Düsseldorf, and for eight years was a pupil of August Weber and Andreas Achenbach. Returning to Cincinnati in 1872, he was placed in charge of the art department of the second industrial exposition of that city. He designed the art hall of the exposition, and brought together there the first important "loan collection" exhibited in this country. He settled in Baltimore in 1876. His best-known paintings are Siehengehirge, Lake of Wallenstadt, Lake of Four Cantons, Norwegian Waterfall, Solitude, A Rainy Day, Vesper Hour, and A Tyrolean Cottage. He was also the author of a book of poems, "Dolce Far Niente," and "European Life, Legend, and Landscape."

Willy J. E. Hamacher, the landscape and marine painter, has died at Reinerz in Silesia, at the age of forty-four. He was a pupil of Hans Gude and won the gold medal at the Berlin international exhibition of 1896.

From Halberstadt comes the news of the death of Paul Meyer, the genre painter, in his forty-sixth year.

Finance.

THE STEEL TRUST DIVIDEND.

When the Steel Corporation was formed, in April, 1901, the $550,000,000 common stock was issued, on a basis varying from equal exchange to $125 in the new stock for $100 of the old, to acquire the common stock of eight Trusts already existing in the American steel trade. Of these older common stocks, those of four companies were paying dividends at the time of the amalgamation, and those of four others had never paid any dividend whatever. It was reported—rightly or wrongly—that shareholders in the outside concerns had been induced to enter the amalgamation by a promise of dividends; however that may be, quarterly dividends at the rate of 4 per cent. per annum were begun on the common stock in September, 1901.

So long as the "trade boom" of that year continued, things went well enough; but in 1903 a sudden trade reaction came. Earnings fell so low that not only was the common stock dividend not earned, but nothing was earned on the half-billion preferred. The common stock dividend was passed; that on the preferred was paid out of the past surplus, and the surplus fund fell to disquietingly low proportions. In due time, trade revived, but the corporation had learned a lesson. In October, 1906, although surplus earnings then surpassed all previous experience, dividends on the common stock were resumed at the annual rate of only 2 per cent., large appropriations for repairs, replacements, and new construction, being made out of current earnings. This dividend rate remained unchanged until last week.

The common shares sold at 55 in the wild speculation following the merger of 1901; their price fell to 8⅝ after dividends had been passed, two and a half years later. It never touched the quotation of 1901 again until the excited "after-election" market of last autumn. Last February, it declined nearly to 41; shortly afterward, an extraordinary speculation began. The general public was buying only sparsely, but certain large Wall Street interests bought seemingly without restraint, and early last month, they had got the price actually above 70. Incidentally, the remarkable attempt to induce the rich French market to speculate in the stock began. This particular undertaking was checkmated, temporarily at any rate, by the interference of the French government with the plan to "list" the stock on the Paris Bourse; but the New York interests still held up the price. Then came last week's announcement of a 3 per cent. annual dividend, instead of 2.

Thus far, all that appears is that the rate of dividend has been raised. That simple fact would not prove, any more than would a "Paris listing," that the property was really any more valuable than before. The propriety of increased dividends is commonly determined first, by earnings. Now the net earnings for the quarter ending last June, from which the higher quarterly dividend was paid, were $29,340,000, which was $9,000,000 more than was earned in the corresponding quarter of 1908. Here was a handsome increase. But that quarter in 1908 was in the aftermath of financial panic. In the same quarter of 1907, when the annual 2 per cent rate was regularly maintained, net earnings were $45,500,000; in 1906, when it was not deemed wise to pay anything on the common shares, the quarter netted $40,125,000. That is to say, the increase in the quarterly dividend is made at a time when the company's net earnings are less by 35 per cent. than in the days of a smaller dividend, and less by nearly 30 per cent. than in the days of no dividend at all.

Such a policy contrasts so singularly with the habit of experienced corpora-

You Should Read This New Bond Book

"The World's Greatest Industry"

Every investor, small or large, should ask for our **New Bond Book.**

It tells some facts, now too little known, about the most attractive bonds that we know. The book is written after fifteen years of experience in selling these particular bonds.

They pay 6 per cent. interest—a higher rate than can now be obtained on any large class of bonds equally secured.

They are secured by first liens on valuable farm land. Some are tax liens—Municipal obligations.

They are serial bonds, so afford opportunity for either long or short time investments.

They are issued in denominations of $100, $500 and $1,000, so they appeal to both small and large investors.

They are by far the most popular bonds that we sell. You will want some of them when you know all the facts.

Send us this coupon or write us a postal. Please do it now.

tion managements, that it would in any case call for explanation. Two explanations are presented, neither of them officially—one, that the dividend rate in 1906 was fixed too low; the other, that the "putting back of earnings into the property," between 1903 and 1907, has so far strengthened the company's physical resources that, with return of good times, it will be able to report unprecedentedly large earnings, which the present increase in the dividend only anticipates.

The first argument will hardly meet the approval of conservative critics, who are practically a unit in declaring that the Steel Corporation's fiscal policy, since it got its lesson in 1903, has been wise and altogether beneficial, and that any other policy would have quite possibly repeated the blunder of 1901. The second argument has this much of force, that a new and highly efficient steel-producing plant—capable, with the company's other plants, of meeting customers' demands for many years to come—has been virtually completed by applying current earnings to the purpose. This particular requirement will not hereafter exist on the same scale. On the other hand, appropriations for improving, replacing, and extending the rest of the company's plant, which are a constant charge, and which ran as high as $36,000,000 in 1906 and $39,000,000 in 1907, have since then been wholly suspended. Had they been continued, some heavy deficits would have been caused, in the past two years, by paying even the 2 per cent. annual dividend.

It is reasonable to suppose that the problem of future needs had been thoroughly examined, before last week's increase in the dividend. In the end it may turn out that the increase was amply justified. The offsetting considerations are, that improvement appropriations may be held down, for the sake of showing larger earnings and higher dividends, with the result (as in the two years after 1901) of inviting trouble in the future; that no one can be absolutely sure of conditions that will hereafter govern earnings; that increase of dividends because of what is expected but not yet obtained is traditionally dangerous; and that the aroma of "inside speculation" which has surrounded the present episode is at least unfortunate.

THE CLEVEREST BOOK OF THE YEAR
ANNE OF GREEN GABLES
By L. M. MONTGOMERY

The Nation.

NEW YORK, THURSDAY, AUGUST 12, 1909.

The Week.

President Taft's attitude in respect of the newly created Customs Court of Appeals, is understood to be that the judges must be lawyers equal to their responsible duties. The failure of Congress to provide in the Emergency Deficiency bill an appropriation for the judges' salaries may result in the establishment of salaries of $10,000 a year instead of the $7,000 rate which was the figure tentatively fixed upon in the deficiency appropriation. The President has decided to make no appointments until Congress acts. He will doubtless take the most solicitous care in filling the new court. The suggestion that it contain lay members he is said to oppose. The experience of importers with the General Board of Appraisers would seem to support this determination on the President's part. We shall confidently expect the new tribunal to contain no "jokers." The confidence of the country would not be gained by seeing Judge Littauer, Judge S. N. D. North, and others of that ilk on the customs bench.

The President's policy in making census appointments in the South is now announced. In States solidly Democratic, the jobs are to be equally divided between the Democrats and the Republicans. In "debatable" States, however, all the census places are to be given to Republicans. The President's statement adds, with gravity, that in all cases he will insist that the appointees "shall not be active partisans, but capable men." If this means anything, it means that some sort of test or examination is to be made, beyond the mere recommendation of politicians. They, of course, always recommend "capable men"—men capable of great usefulness to themselves. Census enumerators, being special and temporary appointees, have long been made a part of the spoils system, and the bill for taking the next census, while providing that the clerks in the bureau at Washington shall be chosen under the civil-service rules, left the naming of the men who are to collect the actual information, as before, to politicians. The President has shown, by his appointment of a new Director and Assistant Director of the Census, that he is anxious to have a thoroughly scientific and trustworthy piece of work done next year. Yet he must know that a great deal will depend upon the choice of enumerators.

Speaker Cannon's long-promised punishment of the insurgents among his own party reflects not nearly so much upon them as upon him. To his narrow partisan mind it is, of course, just the thing to do. Whip the insubordinate and reward the abjectly obedient—this is always the creed of the party boss, and from his point of view it is often good politics. Not in this case, however; the split in the Republican party has gone too far to be cured in any such way. Indeed, the pettiness of Mr. Cannon's action is likely to make matters worse and intensify the growing opposition to him. And he has not even gone far enough with the axe really to play the executioner impressively. Mr. Fowler has been a very useful man, and so has Congressman Cooper. As for Congressman Gardner, it will hardly improve Senator Lodge's relations with the Speaker that his son-in-law should thus be degraded. The truth is that the Speaker's action will only remind people anew that he belongs to another political age, and that the sooner he disappears from Congress the better will be its atmosphere, the quicker it will respond to the popular will, and the less it will be controlled by selfish interests.

At least one of Mr. Cannon's new appointments will be acclaimed—as it was applauded in the House—that of Congressman James Breck Perkins of Rochester as chairman of the Committee on Foreign Affairs. To this position, he is fully entitled by reason of ability and attainments, and it may well be that his able handling, in behalf of the House, of Mr. Roosevelt's charges against Congressmen in connection with the Secret Service appropriation, won him this preferment. Mr. Vreeland's selection to head the Committee on Banking and Currency had been discounted. He was, with Mr. Aldrich, sponsor for the currency bill passed last year, which remains so melancholy a piece of largely unused and unnecessary legislation, and will now play a great part in the promised efforts to reform the currency at a future special session. He is one of Mr. Cannon's intimates, and, judging by his past record, may be relied upon to take orders.

In view of the improvement in our consular service, it should seem as if the $100,000 granted by Congress to Mr. Knox for extending our commerce might best be used to teach American merchants that they cannot trade with natives of Japan or India on the same basis as with their neighbors of Kankakee. The Philadephia Commercial Museums have long been doing valuable service of this sort, and similar object lessons are widely needed; for we must lay aside the old notion that the Yankee is the shrewdest trader in the world. He is, however, eminently teachable. Our agricultural experiment stations and their wonderful results in diversifying and intensifying crops, prove this beyond dispute. Travelling exhibits of the goods needed abroad and statistics as to the opportunities offered would seem to be one of the needs of the hour, if the American merchant will not study for himself or send the proper commercial traveller—he usually selects a drummer to travel in China, because he has "made good" in some Michigan lumber camp. There is, however, one way in which Mr. Knox's $100,000 could be made of especial value—by collecting and disseminating information showing how our absurd tariff laws, which close our own markets to foreigners, tend to close theirs to us and invariably sow the seeds of dislike abroad.

It is not a convincing argument for Government railway operation—this report which Mr. Bernard M. Baker has made to President Taft upon the freight charges in force across Panama. The Panama Railroad and the Panama Steamship Company are now owned by the Government, and are operated as commercial lines. The rates in force upon American commerce are sharply discriminatory against our shippers in favor of those of Europe. Thus the rate on dry goods from New York to Cen-

tral America is $21.40 a ton, while from Europe it is $20.40 a ton. The Panama Railroad charges from Colon to Panama, in case the consignment comes from New York, $3.46 per ton; if from Europe, $2.77 per ton. Coffee, rubber, cocoa, all show the same comparative difference in rates, Mr. Baker declares. He is of opinion that these discriminatory rates were continued by the present company not of set purpose, but merely as an inheritance from the former owners of the Panama properties. Be this as it may, it is certainly a sinister omen that government control necessitates investigation by an outside party to obtain equitable treatment for the shippers of the nation that is building the Panama Canal. The differences in rates which result from charging what the traffic will bear, instead of rates set upon a mileage basis, are notoriously great. The greatest disparities are sometimes seemingly justified by considerations of return loads, competing carriers, or alternative routings. But the case in point seems to be one where the rates simply bleed the American shipper to the advantage of his foreign rivals.

The old tease of convict labor is again to the fore. The State Labor Department of New York has caused the arrest of a dealer for selling convict-made goods from Illinois without displaying a conspicuous sign that he dealt in products of that character. The law of this State prevents clothing made by our own prisoners from being put on the general market. But this apparently makes our market only a favorite dumping-ground for the convict-made products of the Joliet Penitentiary. The arrested dealer's attorney argues that the requirement to display the sign in question is an interference by a State law with the exclusive power of Congress to regulate interstate commerce. It certainly should seem to discriminate against one class of goods, the subject of interstate commerce, in favor of another class. The difficulties affecting the products of convict labor are numerous. To keep convicts idle would be cruelty to them. It would be to forego the reformatory influence that the practice of a trade confers. To let out convict labor (inside the prison) to contractors is to invite harsh treatment of the State's wards if the contractor is callous or brutal. It too frequently gives an unfair differential advantage over those who make the same product by free labor. To confine the employment of prisoners to tasks which the prison wardens can direct is often uneconomical and ineffective. Probably the best disposition of the matter is to limit the work of the prisoners to providing goods required in the various public institutions. As for the dumping of wares made by foreign convicts upon the markets of another State, the proper remedy would seem to lie in the hands of Congress, and in the widened area of enlightenment in all our States in this matter of prison reform.

It was inevitable that the proposals of the committee of New York Supreme Court judges, aiming to lessen the law's delays, should be sharply criticised by lawyers. Special attack is made upon the suggestion that the demurrer be practically done away with. This is an old and often a most useful pleading, and it is not surprising that the bar should stand up for its continuance. Great abuses have undeniably arisen in connection with it, but these might be got rid of, it should seem, without entirely disallowing the demurrer. Very likely, this was what the justices really had in mind, in their somewhat vague recommendation. As to the salutary nature of their action, as a whole, there can be no difference of opinion. It shows that those most nearly concerned are at last awaking to the need of removing the reproach which attaches to the administration of justice in this State. The judges do well to point out that their plan is only tentative and merely a beginning. To be satisfactory, the reform of judicial procedure will have to be much more far-reaching. The public will be neither contented nor secure until steps are taken to amend the jury laws, so as to make impossible the present outrageous methods, in important trials, and to abolish wanton and frivolous appeals to higher courts.

The defeat of Mayor Johnson of Cleveland, in the special election, or referendum, on another issue in his perennial traction struggle, was apparently not a decision on the merits of the question. It was, rather, an expression of the city's weariness at the way in which the whole matter had been kept in politics, year after year. The forces arrayed against the Mayor conducted their campaign on that basis. The Chamber of Commerce, as also a non-partisan association of business men, and the leading newspapers of both parties, rang the changes on the great harm to the city which was being done by the continued agitation. The cry was for a final settlement and a good rest. Granting that Mayor Johnson was right in his contentions and sincere in his motives, he made the fatal mistake, politically, of tiring the people out. The ability of a democracy to remain at a white heat of indignation, and to keep its attention fixed steadily upon the same subject for a long time, is notoriously limited This is a lesson which many a leader before Johnson has had to learn in bitter experience, and it is his turn now. Besides this fatigue of the electors, there was the difficulty that the rival plans submitted to them were not so radically different as easily to arouse intense feeling. The so-called Schmidt franchise was for only a portion of the street-car lines, but was for a flat three-cent fare. On the other hand, the proposal of the old companies, as suggested by Judge Tayler, in whose court the receivership had its authority, was for a reorganization and a franchise, under which the maximum fare was not to exceed seven tickets for twenty-five cents, with one cent additional for transfers, while the earnings of the corporation were to be kept to 6 per cent. on the actual value of its property. This is undoubtedly the settlement which will now be made.

The people of Connecticut evidently think that New York State has got a good thing in its Public Utilities Commission law. Last Thursday in the lower house of the Connecticut Legislature, there was a battle royal between the Chandler bill, modelled after the New York statute, and the Barnum measure, contrived in the interests of the railways and the trolley lines. Connecticut has long had a railway commission of the "weak type," with power only to scold. Places upon it have been political plums, whose net effect has been to draw salaries from the State Treasury and to furnish passes for the Commissioners and their families. The Barnum measure proposes to except from the jurisdiction of the new commission steam and electric roads. It is charged

that the attorney of the New Haven Road is its author. The Chandler bill would do away with the present Railroad Commission, and give the new commission power over all public service corporations. The presence and activity of lobbyists and corporation managers on the floor of the House became so scandalous that the Speaker, amidst an uproar, finally ordered their ejection. After it seemed violently probable that the Chandler substitute for the majority's recommendation of the Barnum measure would just pass, three votes changed with suspicious rapidity, and the substitute for the majority report was negatived, 105 to 103.

Dr. Jameson and Gen. Botha, sitting side by side on the steps of the throne in the House of Lords, while the Colonial Secretary asked for the second reading of the bill to create a South African commonwealth, in which Briton and Boer should have equal rights—this is the astonishing and gratifying spectacle which England is able to offer to the world. Who could have believed it possible, when the desolating war in South Africa was raging, so short a time ago? It is a vivid proof that Great Britain has not lost her acquired skill in colonial administration. So healing and constructive a piece of legislation as this Act of Union for the four South African Colonies has not been seen in many a year. It is an evidence of England's real greatness more convincing than all her battleships. The consummation of this great act of statesmanship under a Liberal Ministry will rank as perhaps the proudest achievement of the present Government. The Conservatives were at first cold to the project, which they pronounced premature, but in view of its triumphant conclusion, they do not stint their applause. Both Lord Curzon and the Marquis of Lansdowne offered their hearty congratulations to the Government, and even Lord Milner uttered no jarring note. All this is far more of a national glory than talking till doomsday about *debellare superbos*.

In replying in the House of Commons, the other day, to the protests of the Labor members at the official welcome to the Czar, the Foreign Secretary declared, for the Government: "It is not our business to know what passes in the internal affairs of other countries where we have no treaty rights and no extra-territorial obligations." This was in response to the array of statistics showing the appalling number of military executions in Russia. Now, this position of Sir Edward Grey's may be sound, but it certainly is not the traditional position of England. She has long aspired to be, as Lord Rosebery once put it, the "moral censor of Europe," and has made it very much her business to know what passes in the internal affairs of other nations. Is Palmerston so completely forgotten? Has Gladstone passed wholly out of remembrance? In the case of Bulgarian atrocities and Armenian massacres, it is true, England might be alleged to have a right of intervention under her treaties with Turkey; but what really led to intervention was simply moral indignation overflowing the nice boundaries of diplomatic propriety. It is hardly fitting for a Liberal Minister to disown the past of the Liberal party.

Reports of the "general strike" in Stockholm seem to point to a result similar to the recent strike in Paris, and for much the same reasons. Everything now indicates a failure of the strike; partly due, perhaps, to lack of funds and dissatisfaction of the rank and file with their leaders, but due, in large measure, no doubt, to the public opinion, which is probably as strong in Sweden as in France, against a strike which tends to render inoperative the necessary activities of a great city, tying up traffic, shutting down electric lights, and paralyzing postal service. To put up with such widespread practical inconveniences, the community must feel that a great moral and social principle is involved; and whatever one's political and social ideas may be, it is obvious that the general strike is not widely regarded as an inclusive moral measure. Even in the Socialist camp there is much condemnation of the general strike.

Recent threatened revolutions, in Russia, France, Spain, and Sweden, have all been more or less connected with industrial disputes. The "general strike" has played a part in all of them. It may be noted that in these countries, especially in Russia and Sweden, general culture takes a strongly modern turn. Their literature, art, and music are largely limited to those materials and ideas which are of relatively recent origin. To the imagination of the modern writer, even in a country of classic tastes, such as France, the new social tendencies strongly appeal. Witness not only the great Russian group, but also men like Anatole France, Octave Mirbeau, and, indeed, a large proportion of the contemporary writers of distinction. In music, the name of Tschaikovsky suggests an intense art comment on the modern social consciousness. In Sweden, the "intellectuels" are especially affected by the latest note, often expressed with an extreme hopelessness.

It is about fifteen years ago that the Spaniards were fighting the Moors at Melilla, much as they are to-day, without, however, quite so heavy losses. But conditions in their camps in 1894 explained clearly why they made no better showing against the tribesmen in Africa or the natives in Cuba. At that time the famous Martinez Campos commanded, but the sanitary situation was unspeakably bad, the men being crowded together, with little genuine discipline. The sentry work was poorly performed, and there was a general air of laxity and shiftlessness which fully prepared the observer for the weaknesses exhibited by the Spanish army in Cuba. The Spaniards, moreover, had lost severely in their conflicts with the Kabyles, who then, as now, fought with the fanaticism of the Sudanese in their battles in Egypt. It was currently believed that the Spanish general who fell in one of the engagements was shot in the back by his own men. But the troops were on the whole marvellously cheerful, considering everything. For Melilla is at best an unattractive place, a town crowded on to a high rock jutting out into the Mediterranean—picturesque enough, but lacking in all real comforts and wholly inadequate to house the wounded properly. The fortifications are mainly antiquated, the outlying blockhouses still dangerous to maintain, and the whole town probably untenable, were the enemy in possession of modern artillery to mount upon near-by mountain slopes. That the Spanish army was as unable to profit by the lessons of the 1894 Melilla campaign as by its years of fighting in Cuba, is apparent from the present battling.

THE UNSETTLED TARIFF.

The tariff bill which was to settle everything, has settled nothing. It was to end agitation, but has only sharpened it. No other inference can fairly be drawn from the strong opposition shown to the last by Republicans in both House and Senate, from the President's statement at the time of signing the bill, and from its reception by press and people. The tariff is plainly to remain one of those unsettled questions which will have no pity for the repose of this nation. It will not be settled till it is settled right.

No previous Republican tariff has been passed with such marked Republican disapproval stamped upon it so conspicuously. When the McKinley bill came up for final passage, only one regular Republican Senator, Mr. Plumb of Kansas, voted against it. Senators Pettigrew and Paddock were also recorded in opposition, but they were even then regarded as more Populist or Democratic than Republican, and Mr. Pettigrew did, in fact, shortly abandon even his nominal Republicanism. For the Dingley bill in 1897, the solid Republican vote in the Senate was cast. Contrast this with what we saw on Thursday of last week. Despite the full pressure of party, notwithstanding appeals in which even the President is said to have joined, seven Republican Senators stood out to the end, recording their protest against the Payne bill, as giving the lie to party pledges and containing, as Senator Dolliver boldly contended, swindles upon the American people. The two Senators from Minnesota, the two from Iowa, the only Republican Senator from Indiana, with one from Wisconsin and one from Kansas, refused to fall in line with their party. Nothing so significant and so ominous has ever before attended the passage of a high-tariff bill. It argues irresistibly that a great change has come over the country. These Republican Senators faithfully represent their constituents. The Republicans of the West are up in arms against the continuance of protective duties which mean high prices and monopoly. Unless something is done to satisfy them, disaster to the Republican party is certain to follow.

This sense of widespread dissatisfaction and rebellion is distinctly reflected in President Taft's statement. He signs the bill, for the sake of its good features, while admitting that it is not "a complete compliance with the promises made." And he gives a plain intimation that the end is not yet. Speaking of the power conferred upon him to employ skilled agents to investigate the actual working of the new tariff, he remarks that they will be enabled to acquire information "under circumstances *favorable to its truth*." The implication that much of the alleged information submitted to Congress was only a pack of lies, could hardly be clearer. Furthermore, declares Mr. Taft, the exact facts, as secured by the Tariff Commission, will furnish a basis for "future Executive *recommendations*." But Executive recommendations about the tariff can mean only recommendations to Congress to change certain schedules. This is the obvious inference from the President's language; and it is borne out by the explicit assertion of a Washington correspondent that Mr. Taft is making plans for further tariff revision. This suggestive dispatch says:

> The President has let certain Senators and members of the House know within the last few days that he is not satisfied with some of the schedules in the new law, especially with the woollen and cotton schedules. He has made up his mind to pursue the investigation into those schedules which he began just before the bill came out of conference, and upon the results obtained from this line of inquiry to base a recommendation to Congress for further action which will involve a substantial revision of them.

We shall hear more of this when the President makes his Western tour next month. All accounts agree that the Republican managers in the West are deeply concerned over the political outlook. They are counting much upon Mr. Taft's efforts to "soothe" the disgruntled people in their part of the country. But the only way to soothe a man who feels that he has been cheated, is to show that you propose to correct the injustice done him. This is as true of tariff cheating as of any other kind. Men in the West are now persuaded, as the speeches of the Iowa Senators show, that many parts of the Payne-Aldrich bill are designed to rob them; and when the President goes out to talk to them, they will want to know what he is going to do about it. If he intends to go to the root of their discontent, he will have to expand his statement and let it be seen that he means still to use every weapon in his power to redress tariff wrongs.

This will be sneered at as "piece-meal" revision. But that is the only way now left to prevent piece-meal stealing. And an attack upon one iniquitous schedule at a time, would make the pretence that the whole business of the country was again to be thrown into confusion, appear ridiculous. The tariff thieves would, of course, cry out for fear that their plunder might be taken from them, but nobody else would be disturbed. Only by thus pressing on with the work to which he has set his hand, can the President justify himself for accepting a bill which confessedly comes so far short of his promises and his hopes.

THE ALDRICH INCUBUS.

It is announced that Senator Aldrich now thinks it doubtful if the bills for currency reform will be ready for introduction when Congress meets in December. Yet his interest in this subject remains intense. He is to make public addresses on the important topic, during the month of October, in Chicago, St. Louis, and other cities; and is to press the matter upon Congress, either in the regular session, or at a special session which, it is rumored, may be called in the autumn of next year. In any event, the great measure is to be under the peculiar charge of Senator Aldrich. His friends have known for some time that it was his ambition to round out his political career by affixing his name to a comprehensive financial bill that should cure our currency and monetary ills for all time, and cause the Rhode Island Senator to be looked upon by coming generations with something of the admiration and awe that Englishmen cherish for Sir Robert Peel.

With such an ambition, we cannot avoid having a certain sympathy, but truth compels the statement that Senator Aldrich can never realize it. After what has happened in the sight of all men during the past four months, it would be madness for currency reformers to pin their hopes to this man. Any bill identified with his name would be politically damned from the moment of its introduction. We do not like to say this, but we believe it to be the fact. Senator Aldrich's ability and skill we freely admit. His desire to put our financial system upon a sound footing may be perfectly unselfish and states-

manlike. Yet he ought to be told plainly, as ought those who are working with him and hoping for great currency reforms under his leadership, that his reputation, and the things he now stands for in the public mind, are such that any financial measure he advocates will be from the first violently suspected, will be powerfully attacked, and will be defeated. Senator Aldrich has made himself an incubus which will crush into failure even honest and needed legislation. The first reform which currency reformers should strive for is to take their cause wholly out of the hands of Nelson W. Aldrich.

If this seems a hard saying, let any one who dissents from it calmly weigh the facts. Let him consider what sort of influences in politics those are with which Aldrich has now inextricably tied himself up. His name is, to-day, throughout the land, the synonym for grasping and corrupt legislation. His course on the tariff has made what was before strong suspicion turn into positive conviction. The whole country has seen him standing athwart reasonable tariff revision, antagonizing and eviscerating the best features of the House bill, rallying to his support the worst men in public life and repelling the best, driving one-sixth of his party in the Senate into open revolt, and, throughout, making himself the attorney for selfish and unscrupulous interests. The men are known who have "seen Aldrich," and got him to arrange the law so as to put money in their pockets, and then gone away and boasted of it. We do not charge him with corruption, but he has been the willing servant of unscrupulous and corrupt men and corporations. This fact is known of all men; and there can be no mistaking the effect if Aldrich were to come forward next December as the sponsor and framer of bills for currency reform. The instant outcry would be: "What private interest is he serving now? What money-making scheme for whom lies behind this bill of his?" Under any auspices, a measure for the reform of our currency laws would have a hard time of it getting through Congress next winter; with Aldrich to father it, defeat would be certain in advance.

The *Nation* is fully of the mind of those bankers and business men and economists who regard the need of setting our financial house in order as urgent. The shameful experience of 1907, when there was practically a suspension of payments throughout the United States, largely owing to our system of banking and currency, ought never to be repeated. Legislation should be had to bring this country into line with the practice of progressive nations. Too much emphasis cannot be placed upon this. The importance of the matter cannot be exaggerated. But the more imperative we feel the duty to be, the firmer should be our demand that the wrong man should not be set in the forefront of the work of its discharge. We cannot afford to prejudice this great undertaking by entrusting it to the leadership of a Senator whose motives are suspected, and whose latest public activity has been in contemptuous disregard of the needs and desires of the whole country.

All this may be said to be quite too morally fastidious. Very well: put it on the ground of the most "practical" politics. It is alleged that Aldrich can "put it through," that he can wield the whole power of "the organization' to force a good finance bill to enactment. But can he? Look at the mess he has made of it. When was the Republican party in Congress ever so divided and distraught as to-day? And it is largely his doing. Dislike of his personality and anger at his methods have riven the party following and filled many Republican Senators and Representatives with the determination to oppose whatever he favors. This may be unreasonable, but it is the hard political fact with which "practical" men must reckon. Go to any intelligent and disinterested Congressman and ask him what chance there is of an Aldrich currency bill passing, and he will tell you: "None whatever. We have already all the Aldrich we can stagger under for the next Congressional elections." Whether, therefore, we take the high moral view, or the low political one, the inference is the same: Aldrich has made himself impossible.

THE JAPANESE SUGAR SCANDAL.

Japan, too, has had her Sugar Trust scandal, greater if anything, and certainly more sensational, than that which has led to the indictment of our Sugar Trust officials and lawyers. Here, too, was a large aggregation of capital bent on aiding the "ultimate consumer" from that same philanthropy characteristic of our American Trusts. In Japan, as well as in this country, there was a close alliance between the Sugar Trust and the tariff, and the former was quite as eager for special favors at the hands of the Government as our own. But there is one marked difference: Japanese courts have been prompt and merciless. Within two months from the first arrest of men prominent in public life, the decisions of the court have been rendered, and the sentences put into effect, despite the fact that no less than seventy lawyers, a larger array even than counsel for our own Trust, pleaded for the accused. We are very much afraid that by corporation managers in this country this ruthlessness of the Japanese courts will be set down as another shortcoming of a yellow race to which we are so infinitely superior.

The swift action of the Japanese court in these sugar scandals, recently reviewed at some length in the London *Times*, is particularly interesting because of the marked political features of the Trust's prosecution. The "Great Japan Sugar Company" was formed in 1906 by several refineries in the boom-time immediately after the war with Russia, with a capital of six millions of dollars, on which it paid 84 per cent. in dividends in its first year, 32½ per cent. in the second, and 15 per cent. in the first half of its third year. By that time, however, the company was badly shaken by rumors that it, like our own Trust, had been paying dividends out of money "earned" by defrauding the customs officials. Finally, late in 1908, a bank which had loaned large sums to the Trust went under, and a creditors' committee speedily discovered that the Trust was practically bankrupt. It then owed two millions of dollars to the customs (our Trust was also just two millions in debt to our Treasury for fraudulent underweighing at the same time), and its liabilities were nearly equivalent to the total of its capital. Moreover, the directors had been speculating in the Trust's shares on the heads-we-win-tails-you-lose plan (also not unheard-of in the United States), by which, if they made profits, they pocketed them, but if they lost, the losses were charged against the company.

This was bad enough; but there were worse features. To help themselves out

of their difficulties, the directors sought to obtain legislative aid for their poor struggling concern. But with curious Oriental ineptitude, instead of buying tariff favors by contributing to campaign funds of the all-wise and ruling political party of the hour, they chose the clumsy way of directly purchasing members of the lower house of the Diet. Up to that time, they had shown their usual ability to copy Western methods successfully. Even when they bribed, these poor heathen did not know enough to cover their tracks, so that soon no less than twenty-four members and ex-members of the lower house were in jail. The Trust first used money to obtain the passage of a bill encouraging the export of sugar by granting a rebate of the consumption-tax. This went through with a rush. In the next session of the Diet, the Trust tried to get what has not yet come about here—a state monopoly of sugar to which the Trust could then comfortably sell out. After spending $60,000 in "fixing" legislators, the Trust was compelled to abandon this plan.

Of the jailed politicians, one was president of our American Board of Missions' useful college at Kioto; the others were politicians of every party. But in the treatment of these statesmen appears the real Japanese inferiority to us. There seems to be something wrong with their statute of limitations; their lack of demurrers, appeals, postponements, of abstruse technical questions to insure the rights of the accused, is painfully uncivilized. The arrests only began in April, but by July 5, of the twenty-four accused politicians, one was acquitted and twenty-three were found guilty and condemned to terms in jail of from three to ten months, execution of the sentence being deferred in seven cases. The benighted Japanese judges failed wholly to accept the plea that, as the offenders were people of high position, they felt their disgrace and pain more keenly and should therefore have only nominal sentences. Instead, the foolish court ruled that the more exalted the offender the greater the severity with which he should be treated, and then rubbed it in by ordering the return of the bribes. What would become of us if such vicious Oriental beliefs were to become prevalent in our fair land?

We fear that, despite their obvious errors of judgment and the shortcomings of their courts, these Japanese financiers will be held by many Americans to be not far behind some of our own. But to those who would use this scandal to bring up the old stories about the lack of Japanese commercial integrity, we would suggest that a recalling of our insurance scandals alone will show that we reside in the most fragile of glass houses. The fact that some Japanese politicians have been proved dishonest, and some financiers are now about to go to jail, is no more reason for doubting the nation's integrity than our own scandals were just cause for asserting the total depravity of all American business life.

CHURCHES AND WAGE-EARNERS.

In a recently published volume, the author devotes his attention to "a specific, clear-cut problem—that of the gulf between the masses of the laboring people and the churches to-day." The book is based upon conditions long grievously exaggerated on both sides. Such a declaration as "the attitude of the majority of class-conscious workingmen is, on the whole, an attitude of active hostility to anything and everything connected with the churches," will at present be resented by both churches and wage-earners.

The question itself is not new. So far back as his day, Phillips Brooks once said publicly: "I like workingmen very much, and care for their good, but I have nothing distinct or separate to say to them about religion; nor do I see how it will do any good to treat them as a separate class in this matter in which their needs and duties are just like other men's." Nevertheless, with the growth of the labor movement, the churches have felt the need of special appeals to workingmen. Four leading denominations, Presbyterians, Episcopalians, Methodists, and Congregationalists, not to mention the varied activities of the Y. M. C. A., sustain "labor departments," in the hope of maintaining cordial relations with wage-earners. Ministers become more often members of local labor unions. Discussion of labor subjects under church auspices, noonday services in factories and mills, indicate the intent of the churches. Labor Sunday, now appointed in May at the request of the American Federation of Labor, is another noteworthy sign. Here is the way one Western city observed it this year:

> The fifty different labor unions of the city were invited to the sixteen churches which coöperated with the Labor Trades Assembly in the observances. Some unions attended in a body, making a fine showing. At some churches, men from the ranks of union labor made addresses; this feature will be more widely adopted next year. Both ministers and labor leaders are glad at the results, and are laying plans for a better observance of the day next year.

If these facts were all, the bridge would touch only one side of "the gulf." But workingmen also show a change of attitude. At a recent meeting of union machinists in Boston, when an international official uttered disparaging criticism of the churches, he was stopped by hisses. On the other side of the Atlantic, several hundred English churchmen from the Brotherhoods visited Belgium last spring: in one city their arrival "was signalled by a welcome from 14,000 workingmen, many of whom had come in from the colliery and iron-working towns of the district." Mr. D. A. Hayes, a vice-president of the American Federation of Labor, has gone on record to this effect:

> We have heard it stated that trade unionists are indifferent toward the churches. It is my candid opinion that both sides have unconsciously exaggerated this phase of the question; because I can truthfully say that the great majority of trade unionists are earnest church members, and after fifteen years of active service in the movement, I know from experience and observation that membership in labor organizations has made men better Christians and better citizens.

Whatever credit is to be given to this declaration, certainly there is in it no spirit of hostility.

Socialism has often been adduced among the causes of religious indifference. Critics solemnly assert that it has become among our wage-earners a substitute for religion. But those actually in touch with our working classes know that this is a gross exaggeration. The lack of response by our labor movement to its Socialistic wooers has been continuous. Keir Hardie, M.P., leader of the Socialist-Labor party in Great Britain, returned this year from his American visit disappointed and chagrined at the hopelessness of a similar combination here. Secretary Hayes Robbins of the Civic Federation of New England declares:

> Perhaps nowhere to-day is the conflict with the Socialist propaganda being waged so continuously, so actively, and at such

close range, as within the ranks of the organized industrial crafts.

What are, then, the actual relations between churches and wage-earners to-day? In the Catholic and Jewish faiths, the workingmen are a majority; and a great many Protestant churches would not be able to maintain themselves but for working-class support. Telling evidence comes from Rhode Island. Here, owing to the nature and distribution of the population, industrial problems are found in an acute stage. Hence the value of the testimony, when an able commission, after investigating religious affairs, comes to the following conclusions:

> About half of those in trades unions are Roman Catholics, the rest Protestants or without religious preference. About 45% churches in the State are largely composed of the common people, tradesmen, artisans, clerks. A large number of the 104,000 "unchurched" are not artisans. Hence a large number of the working class are in our churches or under their influence.

It is also well known that among the unchurched workmen, multitudes are recent immigrants. Their indifference or hostility often traces back to ecclesiastical oppression in the homeland. This class, with many native-born working men upon whom the churches have lost their hold, admittedly constitutes a still unsolved religious problem. But such facts as we have cited show that there is no more foundation for hostility between church and labor than there is for a formal alliance.

THE SECOND POET LAUREATE.

I.

It is not always exact to say that

> The evil that men do lives after them;

but this seems to have been distinctly the case with Sir William D'Avenant. To-day he is chiefly known as the initiator of the corrupt Restoration stage and the debaser of Shakespeare. Yet his contemporaries thought him a great poet, and careful reading of his works goes far to justify that opinion.

D'Avenant, like Lope de Vega, was a man who wrote with one hand and lived with the other, or with both. He knew courts and camps and studied them with vast curiosity. He experienced strange vicissitudes of love and war. The Roundheads caught him and shut him up, and in daily expectation of death he wrote part of an epic. Then he escaped, and the epic was dropped for slighter matters. Our most vivid information about him concerns his funeral. Aubrey was there: "He had a coffin of walnut tree. Sir John Denham said 'twas the finest coffin that ever he saw." Pepys was there also: "Here were many coaches and six horses, and many hacknies, that made it look, methought, as if it was the burial of a poor poet."

D'Avenant's early plays are crude and violent, with the exception of "The Platonic Lovers," which is charming comedy. But they are all full of a rich, strange, splendid poetry, too much neglected:

> And as the moon ne'er changes but i' the full,
> Even so the mighty nations of the earth
> Change in their greatest glory. First, their strict
> And rugged discipline to vain delights,
> Their solemn marches next to wanton jigs,
> Their battles fierce to duels splenitive.

And there are subtle, pregnant similes:

> For life is like the span
> Forced from a gouty hand, which as it gains
> Extent and active length, the more it pains.

And there is sweet, sunshiny prose, though less of it:

> He seems a merry and innocent man, for he laughs at everything, as if he had no more cares than a capuchin.

But it is in "Gondibert," the unfinished epic, that D'Avenant's real greatness must be sought. "Gondibert," if anything, justifies the high praise of Dryden, one of the acutest critics that ever lived:

> Nothing was proposed to him on which he could not suddenly produce a thought extremely pleasant and surprising. . . . And as his fancy was quick, so likewise were the products of it remote and new. He borrowed not of any other and his imaginations were such as could not easily enter into any other man.

This at once suggests conceits and oddities, like those of Donne. Doubtless, D'Avenant is not altogether free from such, and Donne's mighty influence, is clearly found in the younger writer. But D'Avenant's originality shows most in his having escaped the bad taste which was fashionable about him. "Gondibert" is distinguished from such work as Chamberlayne's "Pharonnida," so much and on many accounts so justly esteemed by Mr. Saintsbury, not only by the quality of the imagination, but by a certain restraint and self-command in the use of it, a bell-like clearness of utterance, which is, I hope, noticeable in almost all the passage cited below.

II.

No one reads "Gondibert" nowadays, and the reasons are simple. In the first place, the metrical form is wholly unsuited to narrative. The ten-syllable quatrain, admirable for reflection, as with Gray, will not blend its units in a continuous surface, as does the couplet; yet it has not amplitude enough for the individual development which is possible with the Spenserian stanza. Thus D'Avenant's story limps and sways and stumbles, like a maimed soldier on crutches he is not used to. Yet even here the poet shows his great powers. For narrative purposes his medium is hopeless. But in individual stanzas he has rhythms of wonderful grace and melody. I am not aware that Gray read "Gondibert." In any case, such stanzas as the following are most curious anticipations of the "Elegy" in their sweetness of cadence and their antithetic turn:

> Why should we now their shady curtains draw,
> Who by a wise retirement hence are freed,
> And gone to lands exempt from nature's law,
> Where love no more can mourn nor valor bleed?

And the breadth of D'Avenant's subject gave him opportunity for harmony far more varied than Gray's. Take, as mere music, this stanza from the last book of the poem:

> His valor shall the Gothic conquest keep,
> And would to Heaven all your mighty minds
> As soon were pleased, as infants are with sleep,
> And you had music common as the winds.

But it is not only metrical drawbacks that make "Gondibert" unreadable. One cannot be absorbed in the story itself. The characters are human and sketched with vigor, but there are too many of them. One group melts into another, before you can disentangle any. Also, the first book is the dullest, and this is disastrous. As the poet goes on, he seems to find himself. The narrative moves more quickly. The figures have more animation. And just when the work is interrupted, it begins to promise some interest. Very few, however, I imagine, have had courage to persist so far.

The reader who does persist will find himself repaid. The poem is loaded with acute and careful thought. D'Avenant had seen all phases of life, and profited. Like his first patron, Lord Brooke, he was a most curious observer of political problems, and recurs to them often:

> Yield not in storms of state to that dislike
> Which from the people does to rulers grow.
> Power (fortune's sail) should not for threatenings strike:
> In boats bestormed all check at those that row.

Advice as good for the twentieth century as for the seventeenth. Some of D'Avenant's political maxims seem rather Machiavellian; but this gives all the more significance to the moral energy of others. So with religion. "On the most important subjects," says the pious Southey, "D'Avenant's feelings were unhappily in sympathy with those of his friend Hobbes." That is to say, he was no shallow optimist nor conventional believer. Life was perplexing. If

higher powers ordered it, they ordered it oddly:

But sure the heavenly movers little care
Whether our motion here be false or true;
For we proceed, whilst they are regular,
As if we dice for all our actions threw.

Yet the author of "Gondibert" was neither skeptic nor cynic, and if in the following noble lines he touches the weak point of prayer, he brings out by contrast the lofty and divine office of praise:

Praise is devotion fit for mighty minds,
The differing world's agreeing sacrifice,
Where heaven divided faiths united finds;
But prayer in various discord upward flies.

For prayer the ocean is where diversely
Men steer their course, each to a several coast;
Where all our interests so discordant lie,
That half beg winds by which the rest are lost.

III.

But admirable as is the intellectual element in "Gondibert," the imaginative beauty is more admirable still. Those thoughts "pleasant and surprising," those imaginations "remote and new," of which Dryden speaks, meet us at every turn, strange and subtle, but sometimes grand and always rich and splendid. In the passages quoted above I have looked rather to the thought than to the adornment, but in the blending of imagination and reflection D'Avenant is at his best:

And to be rich, be diligent! Move on,
Like heaven's great movers that enrich the earth,
Whose moment's sloth would show the world undone,
And make the spring straight bury all her birth.

Rich are the diligent, who can command
Time, Nature's stock, and could his hour-glass fall,
Would, *as for seeds of stars*, stoop for the sand
And by incessant labor gather all.

In the depiction of passion also this singular imaginative touch gives most striking and fascinating effects. Direct, intense dramatic action D'Avenant's love scenes perhaps have not. But there has rarely been a more delicate and sensitive analysis of love's agony and triumph, or a more radiant expression of them. Bertha grows conscious of her passion for Gondibert:

She thinks of Eden life and no rough wind
In their Pacific sea shall wrinkles make,
That still her lowliness shall keep him kind,
Her cares keep him asleep, her voice awake.

Orna cures her lover Hurgonil of his wounds:

She let no medicinal flower in quiet grow,
No art lie hid, nor artist ease his thought,
No fane be shut, no priest from altars go,
Nor in heaven's choir no saint remain unsought.

Nor more her eyes could ease of sleep esteem
Than sleep can the world's eye, the sun, conceal;
Nor breathed she but in vows to heaven or him,
Till heaven and she his different wounds did heal.

So with nature. D'Avenant is no landscape painter. Humanity is always first with him; but a poetical gift like his could not fail to enrich human passion with the suggestions of natural beauty, or to transfigure the external world by the emotions of the soul. Now it is a sombre touch:

Where desert rivers, cold and private, run.

Now it is an outburst of joyous freshness and sunlight:

All showed as fresh and fair and innocent
As virgins to their lovers' first survey;
Joyed as the spring, when March his sighs has spent,
And April's sweet, rash tears are dried by May.

And I hardly know where we shall find a subtler and tenderer blending of high-wrought pathos and nature's loveliness than in the following stanza:

When o'er him then, whilst parting life she rued,
Her kisses faster (though unknown before),
Than blossoms fall on parting spring she strewed,
Than blossoms sweeter and in number more.

IV.

As a general thing, these snatches of beauty in "Gondibert" are scattered, broken, and fragmentary. One passage, however, the beginning of the third canto of the third book, is a long-sustained climax of really remarkable dignity and grandeur. Unfortunately, it is too long to quote in full. But the poet calls upon all young lovers to cherish his memory:

Thou who perhaps proudly thy bloomy bride
Lead'st to some temple, where I withered lie;
Proudly, as if she age's frosts defied,
And that thy springing self could never die;

. . . . . .

Then when the priest has ended, if thine eyes
Can but a little space her eyes forbear,
To shew her where my marble coffin lies,
Her virgin garlands she will offer there.

. . . . . .

And she will boast how spite of cynic age,
Of business, which does power uncivil make,
Of ruder cells where they love's fire assuage
By studying death and fear for virtue take.

And spite of courts (where loving now is made
An art, as dying is in cells), my laws
Did teach her how by nature to persuade
And hold by virtue whom her beauty draws.

Thus when, by knowing me, thou know'st to whom
Love owes his eyes who has too long been blind,
Then in the temple leave my body's tomb
And seek this book, the monument of my mind.

Alas, young lovers do not greatly care for old poets. "A lady asked me the other day," says Anatole France, "of what use were poets. I told her they helped us to love, but she assured me that one could love very well without them." And D'Avenant himself recognizes that unfortunates who are

Vexed by living beauties of their own
Have shunned the wise records of lovers dead.

Yet here and there one of those who have been lovers long ago may be glad to be guided to a book in which love and life and death and almost all things human are clarified and glorified by the divine magic of beauty.

GAMALIEL BRADFORD, JR.

Wellesley Hills, Mass.

Correspondence.

A LOVER OF GEOFROY TORY.

TO THE EDITOR OF THE NATION:

SIR: The *Nation* dated July 15 contained a notice of the first Royal Printer and Bernard's account of his life and works translated by Mr. George D. Ives. The delight of calling up into still further existence "Maistre Geofroy Tory de Bourges" urges me to address you a few words in honor of the master to whom I owe so much, who gave me the Art and Science of the True Proportions of Attic or Antique letters, besides of course certain rules for speaking more elegantly the French language. I know by his very opening pages that Tory meant the instruction for me. In his preface he reproaches those who will not give what they know, and takes for example the noble workman of the windows —*vitres*—of the Sainte Chapelle of Bourges which the Duc de Berri called Jehan had made. That workman was so ungrateful and such a glutton of his knowledge that never was he willing to teach any man—not even his son, so he said. The windows which he made are of such an art that the sun, however shining it may be, cannot with its rays at all penetrate them, which is a thing very beautiful, and without other example. If he had willingly taught that art, thousands of other men might have made since many beautiful and good operations which have not been made and never will be made.

Those windows I fell in love with and I tried in my way to make windows in accordance with the definition that Master Tory had written out. I am sometimes almost *reproached* with having carried out these ancient principles which Tory regretted to see drifting to nothing. He praises Albert Dürer, the noble German painter; says he is worthy of being made an immortal memory, and we all agree. Then

he goes on to explain the nature of letters and how useful they must be in picture and in window, in tapestry and on walls. Their size, their proportion, their space, are all considered, so that he has named his book "The Flowery Field"—"Champ Fleuri"—for the grace and facility of the name.

Of course, our dear master speaks lightly of his own handling of his book, or rather its beginning. He tells us how in the morning of the Epiphany, having taken sleep and rest and a little light and joyous food, whose concoction had been easy, at the time that men count MDXXIII, being in bed, he took to fantasying, as he calls it. Thereupon some words of a quotation came to him to the effect that he ought to use his special knowledge for the public good; and he remembered, too, other delightful themes Leo Baptista Alberti had written and demonstrated, and those of the late Leonardo da Vinci, who had died at Amboise, and was the most excellent philosopher and admirable painter, and, as it were, another Archimedes. As to Luca Paccioli, in his "Divine Proportion" of letters, he borrowed what was good of the same Leonardo. Albert Dürer made mistakes, and I shall never forget the teaching of our master Tory with regard to the letter N, that the heel should be cut off according to the architect Bramante, as he has shown in the gallery of Pope Julius II, between the palace of St. Peter of Rome and Belvedere. I have always followed him, feeling that nothing could be better both for my art and for all the form of poetry with which our master has invested a question apparently so ordinary. But does not the very republication of the book which you review show how valuable still is the meaning of our teacher?

I do not remember and I have not the courage to look up what the master says of a man who, like him, was a poet in the forms of letters, the scholar who gave us the "Hypnerotomachia" of Polyphilus, and who could hide, as we know, in the first capital letter of each chapter the secret of his love for Polia. I have so wished to be allowed to write some ordinary essay on this bit of love and literature, which had its place in teaching to the world the lesson of form, and is still one of the world's curiosities. I regret to say that I had to sell my copy a few months ago, so that I cannot quote as I should like. But I have used my master Polyphilus on many occasions of good taste and with a secret defiance of the critics who do not know him. My first attempt at a window was taken squarely out of Polyphilus by the use of the photograph; and yet learned critics looked at it and thought that the Renaissance features, dated as we know 1499, were not quite correct. So that I owe to this passionate lover, as well as to the said Geofroy, a continuous guidance, sometimes almost hourly, a good deal over the third of a century. Hence my wish to draw still further attention through these few words to these old friends of mine, whose quality in every way is as high as it can possibly be, but whose rarity, whose strangeness, whose very poetic envelope have prevented our more prosaic age from a sufficient practice of them. JOHN LA FARGE.

New York, July 29.

A CURE FOR "BOOSTING."

To the Editor of The Nation:

Sir: Any person familiar with the methods of teaching prevalent in the ordinary American public school will agree with the conclusions of your correspondent from Colorado writing to the *Nation* of July 15. Young people are too often taught that everything American is perfect, and that any criticism on things American must be unpatriotic and spiteful. The pure genuine patriot is he who hurrahs loudest and oftenest; anything connected with the flag, however remotely, is sacrosanct and beyond criticism, etc., etc.

That sort of mental attitude towards public affairs on the part of the youth of the land is indeed silly—but it is worse than that: it is dangerous because it precludes improvement which might result from candid introspection and comparison with other nations. It opens up a rich, unlimited field for the demagogue.

The suggestion of your Colorado correspondent is that criticism of American affairs by intelligent foreigners should be introduced into the public schools. But it is doubtful whether with such a community the desired result would be reached. Persons in the state of mind depicted would hardly accept with good grace and sincerity any criticism from foreign observers when similar criticisms from known Americans, though in modified form, notoriously excite instant hostility, and carry the imputation of lack of true patriotism. A better method in my opinion would be to lay the proper facts before the child and let him draw his own inevitable conclusions. For instance, instead of asserting categorically that there were less accidents on English railways than on American, official figures might be laid before the pupils with the suggestion that they tabulate the results and draw their own conclusions. In most American schools geography is "finished" in the seventh grade, that is, when the average child reaches the age of thirteen. The only history taught is American history, and that is principally panegyric. In all our wars we were unanimous and absolutely just; our opponents were without a shred of justice on their side; the French government that assisted us during the Revolution was animated with a love of democratic institutions; the Mexican war was a righteous performance; and any man that questions the wisdom of taking over the Philippines is at heart a traitor, etc. But the expansion of the British Empire, the unification of Italy, the recent commercial prominence of Germany—even the French Revolution—are matters of trivial importance. So, too, are the marvellous development of western Canada (with its influx of American immigrants), the tremendous leaps and bounds of Mexico (with its millions of invested American capital), the startling actualities and possibilities of the Argentine and Chili. Every government denominated a kingdom must be a grinding tyranny, and every government labelled a republic must be a paradise of individual rights and freedom: witness, England and Venezuela.

What the American youth of to-day (and incidentally his teacher) needs is a larger mental horizon and a more judicial temperament. He should be taught to look outside of the United States and behind the present era. He should then be taught to look back to our country fairly and impartially and compare what he has seen with what he sees now and here. His patriotism, while quite as strong, will be much more intelligent; the effect on public affairs will be wholesome when he comes to his majority. E. L. C. MORSE.

Chicago, July 20.

UNCUT LEAVES.

To the Editor of The Nation:

Sir: I wish to join the number of those who are thanking you for now sending out the *Nation* with smooth-edged cut leaves. As I have read every word and line of the paper from its initial issue in July, 1865, to the present date, and as it takes at least one minute to cut a copy of it neatly, to open pages, I find that I have consumed fifty-two minutes a year in opening it for perusal.

Multiplying this by the forty-four years of its existence, my total loss of time in the process is equivalent to over a day and a half, if I have made no essential mistake in figuring it. But, I will leave to you the further problem of multiplying this result as it affects me, by the average number of your subscribers for the period referred to—which may make 10,000 times a day and a half.

It may have been thought once that, for a choice, limited-edition book, uncutness is a charm to be obtained and preserved against the vandalism of an unappreciative binder. But it has been really always unnecessary, and it is always a nuisance. If it is desirable to be sure and save the perpendicular and horizontal margins of a page; or, rather, to know certainly that the page is intact, let the printer note, somewhere near the claim for copyright, figures something like these: "1 by ¾ inch." The prospective buyer will then know how to avoid being bereaved and the binder will give up his unprofitable sinfulness. JOEL BENTON.

Poughkeepsie, N. Y., August 5.

A PROPHECY.

To the Editor of The Nation:

Sir: The following amusing propbecy is taken from the argument of Mr. Emmett in the celebrated case of Gibbons v. Ogden, argued before the Supreme Court of the United States in 1824. In endeavoring to maintain that Congress did not have the exclusive power of regulating commerce, he uses this language:

> The thirteen original States were a band of brothers, who suffered, fought, bled, and triumphed together; they might, perhaps, have safely confided each his separate interest to the general will; but if ever the day should come, when representatives from beyond the Rocky Mountains shall sit in this capitol; if ever a numerous and inland delegation shall wield the exclusive power of making regulations for our foreign commerce without community of interest or knowledge of our local circumstances, the Union will not stand; it cannot stand; it cannot be the ordinance of God or nature that it should stand.

The day which he dreaded came long ago, and the Union still stands.

GEO. A. TORREY.

Boston, July 27.

GEORGE BORROW'S WORK IN SPAIN.

To the Editor of The Nation:

Sir: Readers of George Borrow may be interested to know that the work Borrow was ostensibly doing in Spain, is still carried on along analogous lines. I was recently sitting in a third-class compartment in the train from Pontevedra to Santiago, when a genial-faced man with grizzled beard and a pack on his back, got in at a way station. He at once began to offer a book for sale, for one peseta. Soon he was subjected to a fire of comment, which he answered with ready wit. The book was examined with interest by several, who asked what it was. It was the New Testament in Spanish. Finally, one young man and myself bought a copy of the Gospel of St. Matthew for one "perro gordo"—a "big dog," *i. e.*, two cents. To a lover of "Don Jorge" the scene was a striking one.

Charles St. Clair Wade.

Barcelona, July 24.

Notes.

Lord Morley is publishing a collection of George Meredith's letters, and asks the privilege of copying any which may be sent to him.

Out of folly wisdom. The "Journal of John Woolman" certainly has no place in such a collection of books as was intended by Dr. Eliot for educating mankind. It is, however, a work of real charm, and we are glad to hear that Houghton Mifflin Company, impelled by the newly aroused curiosity about the book, is reissuing it, with Whittier's introduction.

At an early date the Fordham University Press of this city will bring out a book entitled "Makers of Electricity," which will contain biographies of eminent electricians.

Some time this month B. W. Huebsch will publish "India, Impressions and Suggestions," by J. Keir Hardie.

Early in September John Lane Company will have ready "Seekers in Sicily," by Elizabeth Bisland and Anne Hoyt, which recounts the experiences of two American ladies on the island.

The Century Company has made an interesting volume of tales for boy readers by selecting, and, to some extent, abridging, "Stories of the Great West," from President Roosevelt's volumes of Western experience and history.

Frank A. Bates has prepared a practical little book on "Camping and Camp Cooking" (The Ball Publishing Company), which in small space gives information in regard to camp outfits, the pitching of tents and lean-tos, with a chapter of general advice and a number of receipts for the layman abroad in the world.

Alaska and its resources is the principal subject of the *National Geographic Magazine* for July, and the facts as presented by the different writers will come as a revelation to most readers. Major-Gen. Greely treats briefly but most lucidly of its economic evolution, the total value of its products since the acquisition in 1867 being $327,651,196, and yet not a tenth of the territory is prospected. There are eleven incorporated cities, modern in their equipment and permanent in their construction, with $20,000,000 of property values. According to Special Agent C. C. Georgeson, there are more than 100,000 square miles which can be utilized for pasture and culture, as hardy vegetables, grains, and forage crops, and capable of supporting at the most conservative estimate a population of three millions. The principal mountain peaks are described by Mr. R. H. Sargent of the Geological Survey, the adventurous work of marking the boundary by Mr. T. Riggs, jr., chief of one of the survey parties, and the wonderful big game by Mr. W. H. Osgood of the Biological Survey. Other articles are upon the great industrial development of the States of Oregon and Washington by Mr. N. H. Darton of the Geological Survey, some giant fishes of the sea by Deputy Commissioner H. M. Smith, and the tallest tree that grows, the eucalyptus, which is known to have reached the height of 480 feet. The numerous illustrations are as usual in this magazine most interesting and striking in their excellence and suggestiveness.

The July number of the *American Journal of International Law* opens properly with the introductory official address of Senator Root as president of the American Society of International Law, at the annual meeting held last April in Washington. In a recent issue, former Associate Supreme Court Justice Brown had a paper on the same theme—in substance, the practicability of leaving to the adjudication of an international tribunal international questions on which the highest courts of the states interested as parties have rendered judgments. Doubts had been expressed, whether it was consistent with national sovereignty for a Power to submit such questions to any extraneous tribunal. Justice Brown thought it might be done without derogating from the sovereignty or dignity of the nations participating in the submission; and Mr. Root reaches the same conclusion. Assuming that each party to an international controversy seeks the doing of justice, and that national courts, however determined to do justice, may unconsciously favor their own nationalities, and that their decisions may not be accepted by the opposing parties who may seek an ulterior adjudication, he sees no greater inconsistency in a nation's submitting such a question to an international tribunal for adjustment than there was in sovereign States of the American Union assenting to a constitution under which questions between themselves or their citizens should be submitted to a national supreme court for final decision. An enlightening paper follows, on how China administers her foreign affairs. Barry Gilbert presents a paper of practical importance, especially for our ministers and consuls abroad, on the practice of granting asylum in our legations and consulates; a subject that has given our State Department anxious thought on more than one occasion. The Barrundia episode and the strenuosity of Minister Egan will occur to many. In a single final page, Mr. Gilbert summarizes the attitude of our government in a very comprehensive way. In fact, the whole article ought to be in the files of American representatives abroad, with the instructions which every one is supposed to have always convenient. One deduction is especially significant: the right of asylum can never be properly invoked to harbor criminals and offenders against the laws, when they are demanded by proper authorities in regular legal proceedings. C. H. Stockton's paper on the London International Naval Conference discusses, among other topics, the question of contraband, appending a list of articles positively contraband, and one of such as are conditionally contraband. A still more elaborate paper, the second part of which now appears, discusses the most-favored-nation clause of treaties. The final part, yet to appear, is to consider the most-favored-nation relations of the United States and Germany—a thoroughly practical question.

Another volume, in the tasteful green and gilt series, issued by the Oxford University Press, contains "De Quincey's Literary Criticism," edited with an introduction by H. Darbishire. The editor's remarks on De Quincey as a critic are clear and discriminating, and call attention to the main threads running through the work of one, who, as Mr. Darbishire says, is preëminently "to be regarded as critic and creator of romantic art." The faults of De Quincey's method are only too visible. They may, perhaps, be summed up in the spirit of recklessness and boastfulness. Too often he makes dogmatic statements, which on another page he just as dogmatically controverts. It gives one an odd sensation, for instance, to read, in his otherwise admirable comments on the supposed "correctness" of Pope, that the misuse of the word "attend" in the line "For him thou oft hast bid the world attend" would alone prove Pope's incorrectness, and then, on another page, to find De Quincey himself employing the word in this very sense. His boastfulness shows itself in constant promises of deep inquisition into the philosophy of some subject which has baffled all other critics, when, as a matter of fact, his own argument trails off into the merely commonplace. Both his boastfulness and his recklessness lead him into a kind of magnificent paradox, as when (in one essay; elsewhere he takes the contrary stand) he bases his praise of Pope on that poet's passion in "Eloisa to Abelard," and denies him force in personal satire. Were it not for this note of paradox, the essay, by setting forth the genuinely poetical aspect of Pope's work, would be a desirable corrective to much of the detraction aimed at him since the days of Wordsworth. But paradox does not always rule in De Quincey's writing. His brief note "On the Knocking at the Gate in Macbeth" leads, as Mr. Darbishire points out, to the very heart of critical procedure. And, to descend to smaller things, almost anything could be forgiven a critic who has so keenly anticipated one of the excesses of modern scholarship as De Quincey has done in these few lines:

> It is a natural resource that whatsoever we find it difficult to investigate as a result, we endeavour to follow as a growth; failing analytically to probe its nature, historically we seek relief to our perplexities by tracing its origin. Not able to assign the elements of its theory, we endeavour to detect them in the stages of its development.

"Col. John Quincy of Mount Wollaston, 1689-1767," contains the addresses made at a celebration in Quincy, in February, 1908, in honor of the man from whom the town was named. The career of the provincial colonel can be given only in shadowy out-

line, for his papers were lost or destroyed. Yet he played an important part in his time, serving long in the Legislature as Speaker, and later in the Governor's Council, and suffered for his political opinions. For it so happened that Colman's Land Bank was formed when Quincy was at the height of his popularity. His constituents were carried away by the liberal promises of prosperity it held out to them, and turned from Quincy, whose common sense warned him against the plausible scheme of making the community rich by issuing paper money. He was set aside, and when the bank party threatened to use force to overbear the determined hostility and arbitrary measures of Governor Belcher, Quincy was placed in charge of the government forces. He lived long enough to be again restored to popular favor, and served his country well for many years after the bank plan had resulted in confusion. The Rev. Daniel M. Wilson has made an interesting sketch of this incident, and in collaboration with Charles Francis Adams describes Quincy as it came into existence as a settlement. Of high interest, too, are Mr. Adams's remarks on the historical vagueness of the provincial period in Massachusetts when compared to the colonial and Revolutionary periods, and the little reputation made by the leading actors. The volume is illustrated, and is published by the Quincy (Mass.) Historical Society.

Canon and Mrs. S. A. Barnett have collected into a volume entitled "Towards Social Reform" (Macmillan) papers originally published in various magazines. The authors know from personal experience what they are talking about, for they have lived and worked among the London poor for thirty-five years. Their point of view is steadily that of practical improvement, and they display remarkable freedom both from doctrinaire prepossessions and humanitarian illusions. Along with sympathetic appreciation of the need for charitable endeavor they vigorously oppose the charity that degrades. It is pointed out that no social discipline can be effective so long as "casual jobs, night shelters, and free breakfasts make it possible for people to have the opportunity to enjoy the license and idleness of a loafing life." Although for American readers, the work suffers from its localized outlook, yet its consideration of social problems is so sensible and judicious that it may be consulted to advantage by all interested in social service.

"Essays and Addresses," by Edwin Burritt Smith (McClurg & Co.), is a dignified memorial of a life dedicated to public service. It contains various papers upon a variety of subjects, preceded by an introductory appreciation of the dead publicist by his friend, Mr. George Laban Paddock. The contents are sub-divided into five general groups: Chicago and Illinois, devoted to State and civic issues; Municipal Government, dealing with municipal questions generally; The Nation, and Anti-Imperialism," both concerned mainly with our new political departure in the field of colonial empire; and Miscellaneous Papers, in which the economic problem of the Trusts is, perhaps, the most important. Mr. Smith's all too brief career finds in this exposition of his thought both a pathetic and an inspiring monument. He was a patriot of the intellectual type, not content with following the prevailing sentiment *civium prava jubentium*. He believed in the old-fashioned democracy of the Declaration of Independence. He never reconciled himself to "necessity, the tyrants' plea," when it traversed the ideal equality of human rights. He refused to confine democracy to geographical limits, or to particular stages of civilization. He forswore party allegiance when he deemed that independence of party pointed the way to the public good. Originally a Republican, he supported Mr. Cleveland's candidacy in 1884 and again in 1892. In 1896 he was chairman of the Illinois Sound Money League, and a member of the national convention which nominated Palmer and Buckner. His later public activities were largely devoted to the anti-Imperialist movement. He was perhaps dominated at the outset somewhat too compietely by his *a priori* convictions upon matters of public law, and too optimistic in his attempted blending of the Austinian theory of sovereignty with an idealistic adherence to the doctrine of natural rights. But where he came into most direct contact with the realities of political life, his views were wholly admirable. Thus in the essay on "Representative Government," he says sagely: "The remedy for existing ills is not further checks and balances. We already spend too much energy in mereiy operating the machinery of government. Its agencies must be simplified and made more directly responsive to public opinion." Pathetic also is the paper on "American Ideals," revised in part in his last days, where he says, doubtless with a backward glance upon his own exacting labors:

> No one, we had supposed, cared any longer to deny that every daughter of the Confederacy was fair and every son brave, but it has been reserved for T. C. DeLeon to offer, in his "Belles, Beaux, and Brains of the '60's" (G. W. Dillingham Company), incontestable proof of the fact. Here will be found set down, in no order whatever, the name of apparently every belle who ever won the least recognition as such in the later ante-bellum South, together with an account of her pedigree, her suitors and dance partners, her husband or husbands, and her children and relatives living or dead. As a succession of flash-light views of the social life of Richmond during the war, the book is not without value, and its reproductions of contemporary pictures are interesting; but a work which is neither history, nor biography, nor genealogy, nor reminiscence, but an undiscriminating mixture of all four, is hard to classify. We cannot but wonder that the publishers should have allowed a volume of 464 pages, containing an average of 20 proper names to a page, to go out without an index.

The national committee, appointed three years ago for the purpose of gathering and arranging material for the history of the Risorgimento, has in preparation an extensive bibliography of related matter, including manuscripts, newspapers, and other publications, based upon the alphabetical catalogue compiled by the Bibliioteca Vittorio Emanuele (which comprises, however, only works issued previous to 1885) and upon the partial lists of Fiorini and of Mazzatinti. There will be supplementary lists arranged for regions, events, and individuals.

Some documents of interest are brought together by Prof. Hermann Gollancz in his "Translations from Hebrew and Aramaic" (London: Luzac & Co.). In the five or six centuries following the completion of the Talmud Jewish scholars did much serious work, grammatical, legal, and literary; but there was a popular demand for lighter matter, and it is matter of this sort that is offered in the present volume. The Targum or Aramaic paraphrase of the Biblical "Song of Songs" is a frankly allegorical interpretation of the book, having no relation to its real meaning, and throughout tame and tiresome—the changes are rung on the way in which Jehovah, the bridegroom, watches over and blesses Israel, the bride; its value lies in the picture it gives of passionate and confident patriotism. "The Book of the Apple" is a dialogue in which the eminent sage Aristotle on his deathbed (sustained by the scent of an apple) discourses to the assembled wise men on immortality and the excellence of philosophy—a feeble imitation of the Phædo, the only point of interest in its argument being the reply to the assertion that suicide would be an easy and proper way of gaining the joys of immortality. The "Story of the Ten Jewish Martyrs," a legendary imitation of the episode in Second Maccabees, contains one curious bit of mythology—the account of the birth of the high priest Ishmael, famous for his beauty of person; the Almighty, taking pity on his pious mother, who was barren, sent Gabriel to take the form of her husband and become the father of Ishmael. Belief in supernatural parentage is not uncommon among the Semitic peasants of Syria, but it is surprising to meet it in a Jewish midrash otherwise of a serious nature; the existence of such beliefs in certain parts of the Jewish world, however, is hardly to be questioned. In an appendix the author gives a mediæval Hebrew elegy on the "Ten Martyrs," paraphrased by Prof. Israel Gollancz. The last piece in the volume is "A Dialogue on Games of Chance," by Leo de Modena, an Italian Jewish scholar who lived 1571-1648. Arguments for and against gambling are given, those of the former sort being the more elaborate and forcible, though the conclusion condemns the practice. Leo was an unstable character, and himself fell a victim to the passion whose charms he so well describes. In rendering the first Hebrew piece, the "Book of the Apple," Professor Gollancz has collated various printed versions and several manuscripts; the second translation, the "Martyrs," is from a manuscript in his possession. The Hebrew text of the third piece has been printed several times, and has been rendered into English by Chilmead (1650) and Ockley (1707).

Five instructive lectures constitute the contents of the latest work of Wilhelm Windelband, entitled "Die Philosophie im deutschen Geistesleben des XIX Jahrhunderts" (Tübingen: J. C. B. Mohr). Among the subjects discussed are the æsthetico-philosophical Pædagogics of to-day; Romanticism and Hegelianism; Irrationalism, Materialism and Pessimism; Positivism, Historicism, and Psychologism; the modern Value-problem (*Wertproblem*), and the Return to Idealism.

Gustav Wustmann's "Aus Leipzig's Vergangenheit" (Leipzig: Fr. Wil. Grunow), the third volume in a series commenced in 1855, comes out aptly for the celebration of the university. It deals with the history of art, theatre, music, and literature in Leipzig, and offers interesting reminiscences of the Schumanns, Gellert, Bach, Geissler, and others, together with reproductions of rare portraits.

"Das moderne Belgien" is the title of a large octavo volume by G. Siösteen, presenting not only the works of architecture and art and the odd customs of the people found in the usual book on Belgium, but discussing, from the standpoint of a native, the industrial, economic, and political conditions in that country. Nearly 150 text-illustrations, and 19 full-page engravings from late photographs and realistic sketches from life assist in affording a glimpse of the land and people as they are (Berlin: Hermann Paetel).

The death is announced of Eugène Rolland, founder of the *Mélusine*, a journal devoted to folklore, and frequent contributor to *La Revue critique d'histoire* and to *Romania*. He was born at Metz in 1846.

From Bad Nauheim comes the news of the death of Gustav Karpeles, the Heine authority, at the age of sixty. Besides his critical edition of Heine's works he wrote "Heine und das Judentum," "Frauen in der jüdischen Literatur," "Geschichte der jüdischen Literatur," "Heine und seine Zeitgenossen," etc.

THE SERIOUS PEPYS.

Samuel Pepys: Administrator, Observer, Gossip. By E. Hallam Moorhouse. New York. E. P. Dutton & Co. $3 net.

It is now some ninety years since the Hon. and Rev. George Neville, head of Magdalene College, Cambridge, put into Lord Grenville's hands six volumes of cipher manuscript from the library bequeathed the college a century before by one of her sons, Samuel Pepys, sometime Secretary of the Admiralty to Charles II and James II. There was little enough in the appearance of the material, or in the career of its author and donor, which gave promise of anything remarkable in the manuscript. Pepys was a man eminent, indeed, in his day and profession as a naval administrator and with some reputation as a virtuoso. Beside his position in the admiralty, he had held other posts of honor and profit. He had been member and treasurer of the Tangier Commission, surveyor-general of the Victualling Office, member of Parliament and president of the Royal Society. He had been a patron of art, literature, music, and the drama, and had collected the books and manuscripts which he left to his college. He had projected a history of the navy, which had never been completed, and had interested himself in various philanthropic projects. In short, he had lived a full and useful life, notable for its public services and its honorable worldly success. These had won for him a place in biographical dictionaries, and even a line and a half in Hume, who noted that "The administration of the admiralty under Pepys is still regarded as a model of order and economy."

For the son of a tailor, who had risen chiefly by his own efforts, this may be reckoned no small achievement; yet it gave little promise of literary distinction. Whatever writing the secretary was known to have done was enshrined in the dusty and neglected files of the navy office and in the correspondence he had presented to his college. The man whom Monck had called the right-hand of the navy was fairly on the way to being forgotten, when, six years after it was unearthed, the "Diary of Samuel Pepys" appeared, edited by the Rev. John Smith. With that was effected a revolution in posthumous fame, unparelleled in literary history; there emerged from the obscurity of more than a century, not, as might have been expected, merely an able man of affairs, but a personality. At one bound, Pepys sprang to the world-wide publicity of a prince of diarists. Since then, the industry and ingenuity of Bright and Braybrooke and Wheatley have given us all in any way fit for publication of the document which Smith issued only in part.

To his diary, Pepys had confided his every thought and motive and action, high and low, good and bad, trivial and important. The result is not merely unique in literature, but almost, if not quite, in life itself. It might be supposed, therefore, that his frankness would not only endear him to his readers, but would give him a place in their esteem, comparable to that he occupied in the minds of his contemporaries. In some measure, this is true. It would be hard to bring together a longer list of appreciations of any man than the one we have of Pepys. Yet the spectacle of a man honest enough to set down his inmost thoughts, even in the decent garb of a cipher, is so contrary to those instincts which lead us to conceal our weaknesses, not only from our fellows, but from ourselves, that it has in no small measure, even to those who love him, endangered Pepys's real strength and position. The same qualities which make his diary immortal have decreased the rightful respect for its author.

For we are apt to forget that to his own generation there was no such man as the Pepys of the diary. Amid its silks and laces, its domestic secrets, its days of good cheer and nights at the play, we are apt to lose sight of the serious side of the man who wrote it. Even today the reader of the diary is not apt to delve into the calendars of state papers or of Pepys's own papers. To previous generations this was quite impossible. The result is that most persons, even among those who have written of him, have had no idea of what Pepys was like. Coleridge, who had little or no knowledge of his serious work, spoke of him as a "pollard" man, without a top, but the sturdier in the lower branches for that. Lowell and Stevenson, to note but a few great ones among many, wrote in the same strain. Yet without the knowledge of Pepys's official life and acts it is impossible to estimate the man fairly. The quality of which critics and essayists have felt the lack, a higher motive, a less materialistic philosophy, may, indeed, to the careful observer, knowing his official record, appear in his diary. Yet in the main it is not to be found there, but in the place one might least expect to find it: in those dry calendars, where is revealed his devotion to his work, and, through that, to his country.

When, nearly forty years ago, an enlightened government began to issue calendars of the state papers for the Restoration period, it early became apparent that the famous diarist had played a more important part in public affairs than had been imagined. With the greater attention since paid to naval history, his fame has grown, and, of late, with the appearance of the three-volume catalogue of his papers in Magdalene College, the Navy Records Society has done much to increase the knowledge of the secretary. It is not too much to say that, had the diary never been written, we should now have very considerable information regarding him, and that he would have fairly recovered his true position in the history of his time. Hereafter our knowledge may be expected to increase, since we may hope for the appearance of his "Navalia," his memoirs, and memoranda, and may look forward to having, in something like complete form, the record of a man whose life is practically the history of the English navy for more than twenty years.

As we go through the mass of his correspondence, as we read his letters and memoranda regarding the navy, as we see the operation and results of his methods, we can see that behind the apparently petty and even childlike simplicity of the diary there stands a man, shrewd, cautious, able, conscientious, honest, and brave, wholly devoted to his service and his government. To the appreciation of this world's goods and pleasures, to the doctrines of Polonius and Franklin, he added a sense of public duty and an unremitting industry in public service which lifts him above the lower levels of his diary and of his time. He represented a class not uncommon during the Restoration, yet not wholly typical of it: the left-over Puritans, trained in the sterner and more efficient school of Cromwell, on whom, amid the corruption and extravagance of a weak and dissolute court, the burdens of state rested. "If it comes to fighting," observed one of Pepys's

friends to him, at a critical time, "the King must rely on the old party"; and this proved throughout scarcely less true of administration. Whatever its faults, the Cromwellian régime had one virtue which came out strikingly under its successor: it bred strong men. They were not always immaculate, and the most was made of their failings by their royalist rivals. Men have written of Pepys, for instance, as if he were a Rochester or a Sedley. But the comparison reveals the gulf fixed between the two classes. One need not, indeed, hold, biographer-like, a brief for Pepys, attributing his vices to his age and his virtues to himself, to do him the justice that, in a sense, he has denied himself. In the great crisis of the Plague he stuck to his post in daily peril of his life, and, with a few kindred spirits, did his share in carrying on the business of the state when all who could—Society, as usual, first—had fled. Before a hostile House, hungry for vengeance for a mismanaged war, he defended his service, his colleagues, and himself, with ability and success. He bearded Prince Rupert before the Board for the good of the service; he even chided his patron for improprieties unworthy of his station. Throughout he was horribly afraid, but he was seldom too frightened to do his duty. Proud of his success in life, of his good clothes, his handsome house, his pretty wife, the respect of his associates, his vanity was neither uncommon nor unhealthy. Compared with the morbid psychology of certain so-called "Confessions," compared with what Disraeli, or a more recent American political personage, might have written, had either ventured on so intimate a chronicle, we may well stand amazed at his moderation. That he was a gossip is refuted by the confidences reposed in him, his reputation as a safe man of affairs, his rise to responsible position, above all, by the diary itself. Only there was his confidence fully bestowed. That it reveals him a mass of inconsistencies is but another way of saying he was human.

The present biography takes its place, therefore, as a part of the Pepysian renaissance and is at once timely and useful. In some measure, it represents the advance of our knowledge since Wheatley's volume, or even the article by Stephen in the "Dictionary of National Biography," filling in the lacunæ of the one and elaborating the details of the other. The author has not confined herself to the diarist, but has told us much besides about the secretary. And though the book contains no great amount of material which can be called absolutely new, it has brought together much hitherto not easily accessible, included, all found, in the usual accounts, and added something beside. It is, in short, the best account of Pepys which has yet appeared. It is well and carefully done, almost invariably accurate, clear, painstaking, and interesting. And though it may not be final or definite, that is a result practically impossible at this time. It is written in the spirit of Pepys's motto, which encircles his portrait by Kneller: *Mens cujusque is est quisque.* But one may fairly hope that in the light of broader knowledge we shall some day have a biography written less in the light of his life than in that of his works, which shall have as its motto: "Seest thou a man diligent in his business, he shall stand before kings." What we need is still more of the secretary and less of the gossip, more of the calendars and less of the diary, more of the navy office and less of the hours outside. In no small degree, indeed, Miss Moorhouse has given us this. But to say of one of the most important periods of his life that to write it in detail would be to write a history of the navy, in a sense begs the question. It is hard to get away from the diary. If the period it covers bulks larger here than the later and greater years of his life, one may, at least, be grateful that so much of those later years is included. We should have been glad to have a much-needed bibliography of Pepys included here, some footnotes, and an adequate index. For the rest, we welcome this volume as a substantial sign of a reviving and better informed interest in a man who has many holds upon our interest.

CURRENT FICTION.

The Score. By Lucas Malet. New York: E. P. Dutton & Co.

"The Score" is not the title of a novel, or of either of the tales which give this volume respectable bulk. Standing, as the accompanying motto explains it, for the balance of good and ill in human character and experience, it might serve as title for any serious work of fiction. One must admit off-hand the claim to respectful consideration of anything Mrs. Harrison may do. It is impossible to regard a book like "Sir Richard Calmady" or "The Far Horizon" as belonging to the common merchantable order of current fiction. If proof were needed of the sobriety of this writer's purpose, it might be found in her failure to follow up the success of "Sir Richard Calmady" by carrying the method a little farther. In that novel, she had made no deliberate appeal to the prurient mind, but her startling frankness no doubt had something to do with the size of her audience. She reaped the dubious reward of the English writer who permits himself to forget the young person. Regretful consciousness of this may have influenced her towards greater reticence in her subsequent work. "The Far Horizon" must have disappointed the less desirable element among her readers. It retained the disabilities of the former book, the diffuseness, the self-consciousness of manner, the superfluities. The *Nation* recorded its opinion that by omission and condensation "the novel might be gainfully reduced to, say, one-fourth its present bulk."

The more characteristic of the two stories, however, which are here bound together leaves nothing to be desired in point of compactness. It presents our old friend Poppy St. John in a crucial moment of her later experience. She is now a successful star, thanks, in part, to the plays which have been written for her by that elegant author and man of the world, Antony Hammond. For ten years their friendship and interdependence have been strong and real. But Poppy is in the ripeness of her womanhood, and not so absolute in her dedication to friendship as she thinks herself. This is the story of her testing and final self-conquest. If in style it is still marred here and there by a touch of petty artifice, an excess of verbal adroitness, in substance it is sound and simple. The second of the tales, "Miserere Nobis," is of a very different sort. It is virtually what Browning used to call "dramatic romance," the death-bed confession of a young parricide. From first to last, it has the air of a translation or paraphrase. Verse seems almost necessary to a narrative pitched in so intense a key. One is tempted to hazard the guess that the author may have planned or begun this story as a poem; in its prose form, it is, to say the truth, strained and ineffective.

Dragon's Blood. By Henry Milner Rideout. Boston: Houghton Mifflin Co.

This we can but feel to be a sad comedown for Mr. Rideout. Only the other day a *Nation* contributor was speaking of him as one of the younger American writers from whom much might be hoped. The remark seemed to be based upon his first book, "Beached Keels," which contained at least two remarkable tales, or studies, of life on the New England coast. They were intense, realistic, sombre, not easy to forget. Why has he done nothing more of the kind? Was it just a "pocket," or did the vein turn out to be unprofitable? His second book, "Admiral's Light," was a rather tamely idyllic story—a short story attenuated into a novel—with still the New England coast setting, but with the prevailing flavor of conventional juvenile romance. For the rest, it was somewhat self-consciously stylistic: there was an experimental air about the whole thing. Well, some of us may have thought, he is trying his hand, feeling his way; we shall get something powerful next.

And now comes "Dragon's Blood"—another experiment, and in what unexpected direction! It is nothing more or less than a blood-and-thunder romance of impossible adventure. Such small flavor of novelty as it has is due to its setting. The action takes place in a forlorn and remote outpost of Western civilization, a Chinese coast-town where the only Europeans are a half-dozen agents of commercial houses, chiefly English and German, a French doctor, and a Protestant missionary, with his wife and daughter. There is also a female villain, wife of one of the agents. The missionary has made converts, and therefore enemies. Feeling against the foreign devils is stirred up by a wicked mandarin, who has his own ends to serve. Up to the eve of the actual outbreak the narrative has vigor and apparent verisimilitude. The lady-villain is rather preposterous in her obviousness, as is the gentleman-villain, who is not unnaturally arranged to be the Frenchman. But the others are sufficiently plausible. However, the sight of blood turns the writer quite mad, and he proceeds to involve all his persons, offensive and inoffensive, in a series of childishly absurd incidents invented for their own sake. The result is what is commonly called "a rattling good story," and this, we suppose, is what Mr. Rideout intended. Let us hope that it will not be so indecently successful as to tempt him permanently from the paths of sensible fiction.

A Gentleman of Quality. By Frederic Van Rensselaer Dey. Boston: L. C. Page & Co.

The story of the doubles and of the confusion arising from their apparent identity is one of the oldest in the world's treasury of fiction. But it is always capable of fresh rendering, always ready to be brought to date, with the accessories proper to each successive generation. The present version is surprisingly adroit and complete, so far as plot is concerned, and this (considering the kind of story) palliates, if it does not excuse, some crudeness of manner. The dialogue is awkward and unnatural, and in consequence it is hard to believe in the flesh-and-blood reality of the speakers. But the springs of action are sound, and the incidents, however strange, have as much plausibility as the nature of the affair demands. For a wife to insist, against his protestations, that a stranger is her husband, may carry the strain upon credulity to the breaking-point, especially when the husband is English and the stranger American. On the other hand, when the Americanism of the stranger turns out to be a mere matter of chance upbringing, and he is revealed as the long-lost twin-brother of the real husband, a mitigating light is thrown back upon the apparent absurdity of much of the preceding incident.

Michael Thwaites's Wife. By Miriam Michelson. New York: Doubleday, Page & Co.

Mr. Jerome K. Jerome, in his excellent book on the stage, has pointed out that by one of the oldest of dramatic conventions a discontented wife may leave the room, put on a new apron, and return to apply for the position of governess to her own children. Now and then, when the new governess does up her hair in a particular fashion, the deserted husband finds himself strongly reminded of his wife. Upon such probabilities the lively author of "In a Bishop's Carriage" and "The Madigans" has built up her latest story. When the bad twin-sister runs away from her husband, the saintly twin-sister, under the stress of circumstances, temporarily assumes the rôle of wife to Michael Thwaites, whose failing eyesight, it must be confessed, makes deception in his case more probable than in the case of the reader. Developed in the proper spirit, the subject of double or mistaken personality can make good melodrama. But, unfortunately, Miss Michelson seems to have taken her plot too seriously. At different times she tries to write like George Eliot, Mrs. Humphry Ward, Robert Herrick, and Frank Norris, when she should have consistently tried to write like Robert W. Chambers.

The Story of the Pharaohs. By the Rev. James Baikie, F.R.A.S. With 32 full-page illustrations from photographs, 48 illustrations in the text, and two maps. New York: The Macmillan Co. $2.50 net.

The Queens of Egypt. By Janet R. Buttles. With a preface by Prof. G. Maspero. Illustrated. New York: D. Appleton & Co. $3 net.

The Exploration of Egypt and the Old Testament. By J. Garrow Duncan, B.D. With 100 illustrations from photographs. New York: Fleming H. Revell. $1.50 net.

These three volumes are the product of non-specialists, and possess the faults of their virtues, though they vary greatly in quality. In Mr. Baikie's history we have the conscientious effort of a cultivated writer who is obliged, however, to take all his results at second hand. He has furnished an attractive volume which reads well. In his effort to present the two schools of chronology fairly, he even heads the pages in the earlier section of his book with the widely divergent dates of both systems. This is to ignore the fact that the older system is rapidly dying and doomed to disappear. In the important matter of the use of sources, he has sometimes been unfortunate in his selection, using the "Records of the Past," which present the science of a generation ago, or taking the date of the marriage of Amenhotep III from Budge, whose inaccuracy is always such that he represents no science whatever, either obsolete or modern. Mr. Baikie omits Nubia on his map, which is unfortunate in view of the fact that Egypt's only permanent conquests were in the south.

In "The Queens of Egypt," by Miss Buttles, we have a more pretentious volume than that of Mr. Baikie, with an introduction written by Professor Maspero. As the earliest women of historical importance whose life and achievements are in some measure preserved to us, the queens of Egypt offer an interesting and an important theme. But the plan of the book is faulty. As so many of the queens accomplished nothing, and as, indeed, there is only one queen, Hatshepsut, of whose deeds we have full information, Miss Buttles's book is necessarily a loose and disconnected series of reports of archæological discoveries, interspersed with lists of monuments of the queens. Besides that of Hatshepsut, not a single personality capable of analysis emerges. Miss Buttles displays commendable industry in the use of sources, but lamentable failure to employ the latest form in which they are accessible. She quotes only Naville on her most important queen, Hatshepsut, and thus obtains translations and views representing the Egyptology of fifty years since. Or, she employs the "Records of the Past," and thus reports that the city of "Zaru," given to Queen Tiy by Amenhotep III, with its huge pleasure-lake, was situated in the Delta, although we have long since known that its name is not "Zaru," and that it was situated far up the river at Thebes. Graver errors result from unfamiliarity with the later translations of the sources. It is even stated (p. 113) that under Amenhotep III the Egyptians conquered the entire valley of the Euphrates, an old misunderstanding which was exploded forty years ago. Perhaps Miss Buttles may be pardoned here, as she obtained the surprising fact from the "History of Egypt," by Newberry and Garstang, who in turn took it from Petrie. If the Egyptian monuments have not shown clearly that the Pharaohs never conquered the entire Euphrates valley, the Amarna letters, with their display of friendly correspondence between the kings of Babylonia and those of Egypt at this very time, should settle the question forever. But Miss Buttles knows nothing of Winckler's edition of the Amarna letters, long since to be had in English, much less of the more recent work of Knudtzon. Had her book been planned as the history of women in the Nile Valley, their position, influence, and achievements, and the proper sources in modern form employed, she might have supplied a

coherent and highly useful but still unwritten chapter in the story of woman.

Mr. Duncan's book is a pale reflection of the views of Petrie. It contains interesting and readable accounts of experiences in the field at Petrie's camp, but is entirely without value in solving any of those problems of the Old Testament which are involved in Egyptian discovery. Indeed, Mr. Duncan has not even perceived the existence of these problems. He is entirely innocent of any critical knowledge of the Old Testament. The following quotation is such delightful evidence of his state of mind that it is worth reading—for reasons hardly appreciable by the author himself:

> Since the Bible states that Joseph was buried in Egypt, and his bones removed to Canaan at the Exodus, somewhere in this neighborhood there ought to be found an empty sarcophagus, or mummy coffin, inscribed with the names, titles, and honors of Joseph. No such tomb has yet been discovered, but it is much more likely to be found in the cemetery of Heliopolis (On), where Joseph is understood to have resided, than in the district of Goshen.

After this, we do not wonder that the garrison of "240,000" men, stationed at Avaris, according to Manetho (not Josephus, as Mr. Duncan states), is accepted as a fact. We are, therefore, still without the much-needed volume by a competent scholar on the relations of Egypt and the Hebrews.

The Hague Peace Conferences of 1899 and 1907. By James Brown Scott. Baltimore: The Johns Hopkins Press. 2 vols. $5.

Official Report of the Seventeenth Universal Congress of Peace. London: The National Council of Peace Societies.

The cynically inclined will accept Mr. Scott's two bulky volumes of nearly 900 pages each as admirably symbolic of their subject. They stand for two great world congresses which gathered after long preparation, debated profound problems at vast length, and dispersed, leaving the world very much where it was before. But the cynical point of view on this subject of universal peace is an easy one to take, as Mr. Scott points out. Any measure of accomplishment compared with a large purpose must appear ridiculous. "Congresses of peace that have put in their time defining the laws of war," sneer the cynics. "A congress of equals whose action cannot be forced and whose decisions must be unanimous," answers the jurist; "let us be thankful for what we can get." That is the attitude of Mr. Scott, America's technical delegate to the second Hague Conference, whose lectures before the Johns Hopkins University make up our first volume. His second is given over entirely to the documents of the conferences. These, with the exception of one important paper, were published last year by Mr. Scott under the auspices of the International School of Peace, and commented on in the *Nation* of December 10. Little of significance has escaped our author. First, here are your original treaties and convention. Secondly, you get nearly 150 pages of condensed commentary on the two conferences. Lastly, you have an expanded account of 750 pages, authoritative and circumstantial.

The growth of international juristic comity, the addition of an article or a clause to the body of international law, are, to the specialist, things worth while. But Mr. Scott is aware that public opinion was concerned, not with international law, but with the limitation of the world's armaments and with the establishment of arbitration. Well, even here there is some gain to reckon. If the limitation of armaments was dismissed at The Hague as unripe for practical consideration, there is at least the formal pronouncement of the nations that the limitation of armaments is eminently desirable. If the principle of arbitration has made painful progress with its Permanent Arbitration Court of 1899 that was not at all a court, but a long list of eminent persons to whom the nations, if they desired, might refer their troubles; and if the Court of Arbitral Justice of 1907 was a court with a general form of procedure and judges' salaries, but *no* judges, the fact remains that from the first conference to the second the gain was so considerable that the ultimate establishment of a real court with real judges and real functions must be declared inevitable. Herein our author, like his former chief, Mr. Elihu Root, whom he copiously quotes, finds a basis for optimism: the habit of peace is growing. The first Conference came as a surprise and a puzzle. But the first Conference already looked forward to a second Conference, just as that second assembly spoke of conferences to follow. Mr. Scott is willing to wait. As long as the idea of international arbitration is making headway, other improvements can bide their time. The nations' refusal to disarm he finds quite natural:

> As long as a resort to force for the settlement of international difficulties is regarded as proper, if not the only and reasonable expedient, no nation is likely to expose itself to strong, aggressive, and not overscrupulous neighbors by depriving itself of the recognized means of protection and self-assertion. The means of warfare and the preparations for war will exist until a substitute for war be proposed which is not only reasonable in itself, but which is so reasonable that its non-acceptance would be unreasonable.

That is, we may keep our armies and navies, and yet sincerely and effectively work for peace.

The nations, our writer speaks of. To us it seems imperative to draw a distinction between nations and governments. When Mr. Scott, in palliation of what the two Conferences failed to accomplish, would rehearse the factors that are now working for peace he must refer to the interdependence of nations; the influence of international commerce; "good understanding based upon knowledge and sympathy"; peace societies, international congresses, conferences, associations, unions; the spread of representative government; the growing sense of the uselessness of war; and the growing sentiment in favor of arbitration. Now, these are all factors of importance; but they are, in a way, manifestations of national and not of governmental sentiment. It is only as the growing dread of war among the nations urges their governments on the road to peace that we can expect peace conferences, after long weeks of high pleading and arguing, not to be brought up sharp against a governmental *non possumus*.

The report of the Universal Peace Congress which met in London in the summer of 1908, deals in detail with just such a popular movement as Mr. Scott had in mind when he enumerated his factors of universal peace.

English Literature in the Nineteenth Century. By Laurie Magnus. New York: G. P. Putnam's Sons. $2 net.

Aside from the manuals which inform the schoolboy that Gower wrote in three languages and that Milton preceded Pope and was a greater writer, there are two rare types of literary history of distinct usefulness and interest—the purely bibliographical and the purely critical. The one would record, say, in the nineteenth century, all the authors of any importance and all their books with carefully ascertained dates and a brief statement of contents. The other would regard the nineteenth century as a great complex personality, would estimate the forces of its heredity and environment, trace the development of its ideas and its powers and modes of expression, and pass judgment upon the period in the light of other periods and other national literatures. The first type demands great industry and accuracy; the second demands immense industry, erudition, sympathy, discrimination, and style. Unfortunately, neither of these types flourishes among us in its purity. Our literary historians for the most part, feeling their weakness on both sides, take a shuffling middle course, leaving thoroughgoing bibliography to the Germans, and mingling with desultory criticism, fragmentary lists of books and trite biographical detail. The desire to say something about everything precludes the possibility of doing justice to anything. As a consequence, we find one of the most distinguished historians of nineteenth-century litera-

ture dismissing John Addington Symonds in a page and a half, in which we learn that he was a consumptive; that he wrote the "History of the Renaissance in Italy"; and that he was prolix.

Mr. Magnus aspires to the more difficult type; he calls his book an "essay in criticism." He possesses some of the qualities which are essential to success in that type. With Victorian literature in general, he is heartily sympathetic and at the same time discriminating. In dealing with individual writers he is direct, specific, and vivid. He comes to close quarters with the style, for example, of Ruskin; speaks appreciatively of the "sense of breadth and space, of the *latis otia fundis*" in his writing; does justice to the spirit which he breathed upon political economy; properly relates his sociological doctrines to his artistic faith; and at the same time lays his finger upon Ruskin's temperamental limitation — his egomania and his quixotism. He has a frequent power over the compact illuminating phrase. Of Newman he writes: "There are prayer and fasting in his style, as well as in his life. It has a virtue, at its best, which can only be described as at once virile and virginal." Of Mrs. Craik's John Halifax he says: "He personified the virtues of Capital. He was the breath in the nostrils of individualism. He illustrated by example the philosophy of John Stuart Mill." His characterizations of the prose writers, on the whole, are less nearly adequate than those of the poets. His mild derision of Mill through Mrs. Craik betrays his bias. Mr. Magnus is by temperament and faith a Wordsworthian—transcendentalist and poet. Fiction, he holds, is a lesser vehicle of truth. The genius of the nineteenth century was not in its philosophers. It is the poets who have effected the reconciliation between knowledge and belief. By virtue of this achievement, Wordsworth becomes his hero of the first half-century, and George Meredith, to whom the book is dedicated, the hero of the second half-century—even so, it is rather strong to say that Meredith is "accounted among the greatest English poets."

His search for the formula of the age, which he finds in its bent for "emancipation," and his attempt to range all the writers with reference to it, gives to the work of Mr. Magnus something of that unity and coherence so much to be desired in a work of this kind. But the formula, like all others hitherto proposed, is far too simple. The great moments of his period (1784 to the present day), the French Revolution and the "Origin of Species," are indeed moments of emancipation. But it is scarcely over-subtle to say, regarding the nineteenth century as a personality, that though its predominant involuntary tendency was toward emancipation, its predominant voluntary tendency was the search for standards, the desire for valid new bonds. The zest of the literature was in the conflict of these tendencies and in the rivalry of diverse-minded searchers. In indicating the line of conflict Mr. Magnus's book is decidedly weak. For instance, he gives no hint that every page of Carlyle's is a broadside against every page of Mill's and vice versa. Indeed, his transcendental leaning and his undefined distinction between literature and not-literature have led him to dismiss the Utilitarians with quite insufficient notice. To make the matter worse, he adds to his brief mention of Mill a single paragraph in which he lumps together a dozen other philosophical writers "who belong to, or are variants of, this school." Among them it is interesting to notice Sir William Hamilton, who represented, in fact, the diametrically opposite school of thought, and "William James (of New York)"! Such a grouping of names as this is of no conceivable value in itself. It is misleading; and it seriously clogs the course of the exposition. Here and in many other places, Mr. Magnus has fallen into the trap of the writer of the literary manual from a desire for inclusiveness.

Yet the failure of Mr. Magnus to bring into strong relief the main currents of literature in his period is due, in the first place, to the lack of political and philosophical ballast, and in the second to an almost total neglect of foreign influences, arising from a wish to prove the independence of English literature. His treatment of the Revolutionary era is superficial. He speaks of the rise of sentimentalism on British soil, of Cowper's hare and Burns's mouse; but he has only a passing and insignificant word for Rousseau and does not even mention the giant struggle of Burke or the sledge-hammer blows of Thomas Paine delivered successively in America, England, and France —does not even mention their names. To write of Shelley or Byron, or Wordsworth without reference to them is as shallow—to compare great things with small—as to write of Swinburne or Oscar Wilde or George Moore without reference to Victor Hugo or Gautier or Baudelaire. In dealing with the romantic movement as with the aesthetic decadence, the resolute chauvinism of Mr. Magnus shrouds the most significant things in a great darkness. To criticise the nineteenth century is still to criticise oneself; and he who is proudest of the achievement of the age is least likely vigorously to anatomize its character.

Louis Napoleon and the Genesis of the Second Empire. By F. H. Cheetham. New York: John Lane Co. $5 net.

Though written in the tone of apology, this book deserves attention because it represents under an attractive literary form a detailed, if not a complete and thorough, account of the early career of a great French ruler. Personally, the third Napoleon cannot be said to have the individual claims to greatness which his admirers, including Mr. Cheetham, would accord him. But he ruled over France in a momentous period of the life of the nation and in more ways than one his acts as President and Emperor were of such a critical character that the whole course of European political life was influenced by his policy. For many years the Second Empire stood as the incarnation of the democratic principle in European politics. It was looked upon as a bulwark against the forces of reaction. Whatever may be thought about the character of Louis Napoleon as a man, or his achievements as a statesman, the fact that he was the leader of the French nation when it was at the forefront of European progress made him a predominant figure in the history of the nineteenth century. It is because of this unique position that the nephew of the great Emperor has been able to secure such indefatigable advocates in his behalf. The literary tradition of our time seems to be strongly in his favor. People forget the virile criticism made by the republican opposition, and almost without exception those who write on this period appear as apologists of the Emperor.

Mr. Cheetham's work does not carry him further than the opening years of the political life of Louis Napoleon. Most attention is given to the obscurer portions of his career when he was the acknowledged exponent of the Napoleonic ideals of government. These years of his life are chiefly interesting for the light they throw on the nature and temperament of the man as these came to be revealed later on. There was then, as afterwards, the same indecision, moodiness, and insincerity, but small evidence of that later shrewdness and readiness to seize the opportunity as it passed. Neither by education nor by innate qualities was Louis Napoleon prepared for the task to which he was called in a moment of patriotic fervor. The moral fibre that from the first was lacking to his nature was never supplied. When he came into public notice he appears as an adventurer, bearing the name of the great Napoleon, but repeating mechanically the formulas and the ideas of the imperial régime. The uncle would probably have seen in the nephew only a specimen of the type of idealogue which the great man so thoroughly despised. Mr. Cheetham does not notice that Louis seems to have inherited his literary tendencies from his uncle Lucian. As a pamphleteer he showed some of Lucian's superficial brilliancy. He certainly recalls Lucian's lack of steadiness. The adventures in Italy, at Strasburg, and finally at Boulogne, cannot, even with Mr. Cheetham's

pleading, appear as anything but exhibitions of incapacity, the results of a badly thought-out and worse-executed programme. The picturesque side of these events is well handled, but the enigmas of the situation are left unexplained.

Mr. Cheetham might have paid more attention to the recent Italian literature on the secret societies so active in Italy during the period of reaction. He should have noticed also the unfavorable references to Louis Napoleon in the memoirs of the time, more especially because Thirria, to whom Mr. Cheetham makes constant appeal, compiled his book largely from the contemporary newspapers; and Le Bey, a later writer, also frequently referred to, is notoriously under the influence of the Bonapartist legend. Mr. Cheetham speaks in a vague way of the activity of Louis Napoleon's personal friends, in France, while he was living in England. Their relations with party politics before and during the republic of 1848 deserve careful examination. It is not sufficient to say that Louis Napoleon's sudden rise represented the aspirations of the majority of Frenchmen. Such a statement explains very little, especially when one remembers that the same electors who voted for a Bonaparte, as President, sent to Paris a body of legislators who were anti-democratic and showed no real sympathy with the Napoleonic tradition.

The Silvæ of Statius. Translated with introduction and notes by D. A. Slater. New York: Henry Frowde. $1.

Few moderns since the poet Pope have taken Statius seriously, and his epics which won him fame in the period that most honored him, the Middle Ages, are now accounted the least significant part of his poetry. His "Silvæ," related at once to the epigram and the epyllion, are more in keeping with the tendencies of his age, and to them one turns to-day, if one reads Statius at all; barring the panegyrics, which were virtually prescribed, these poems contain much that attracts. Poets who have known the Bay of Naples intimately ought to show in their work a certain companionship. Statius is linked by this delightful bond to Virgil before him, and to Pontano and Sannazaro after. His admiration of Virgil and his echoes of certain Virgilian effects are noticeable enough: he suggests also a pleasant trait of the later poets, their habit of personifying bits of the landscape that they loved, of creating mythology from hill and stream as the Greeks had once created it:

> In those caves Anio himself finds rest; yes, he forsakes his source, and when in the secret night he has put off his sea-blue garments, stretches himself upon the springing moss, or into the deep pool plunges his huge bulk, and with rhythmic stroke claps against the glassy waters. In yonder shade Tiburnus rests; there Albula is fain to wash her sulphurous tresses. A bower like this might lure from Egeria, forest Phœbe, rob coid Taygetus of his Dryad bands; and charm Pan from the Lycean woods ("Silvæ," i, 3.).

Another matter that impresses the reader of the "Silvæ" is the poet's interest in works of art. Cicero, and even Virgil and Horace, supreme in literary art, show little feeling for painting and sculpture save where these form a part of some literary tradition; they still have something of the primitive Roman contempt of the connoisseur and dilettante. But by Statius's time, art must have been an important interest in the life of a cultured Roman; a villa stored with beautiful things demanded no apology. The philosopher Pollio, whom Statius celebrates, turns for doctrinal inspiration to Phidias and Myron no less than to Epicurus.

The English reader will not fail to detect these and other attractions of the "Silvæ" in the prose version of Mr. Slater, the quality of which may be seen in the above selection. Our author thinks that Pope, and Pope alone, could have translated Statius into verse. Certainly the recent sonnet quoted by Mr. Slater, which attempts to render Statius's most beautiful poem, the invocation to Sleep, is not a striking success. We have noted only a few minor infelicities in Mr. Slater's translation. One who writes *docta carmina* is not a "scholar-poet" (i, 2, 172); the phrase "Lucretius the prophet and his impassioned lore" for *docti furor arduus Lucreti* (ii, 7, 76) comes nearer the meaning. "Duty, greatest of gods," addressed in iii, 3, is not the deity whom the reader of Wordsworth might expect, but filial devotion, *Pietas*. Mr. Slater should have included a translation of the prose prefaces: the brief statement about them in his introduction is not a compensation.

In the introduction sufficient information is given about Statius and his "Silvæ." The author does not attempt a penetrating study of the poems, but he does well in showing that some of the severest criticisms of them have come from those who have not read them or have read with extraordinary inattentiveness. Thus Tyrrell's treatment in his "Latin Poetry" is based not on Statius, but upon the brilliant though inaccurate essay of Nisard. A matter of interest to which Mr. Slater devotes considerable discussion is Dante's account of the supposed conversion of Statius to Christianity in consequence of his reading the Fourth Eclogue of Virgil. He argues plausibly against Canon Moore that Dante did not invent the legend for a dramatic purpose, but followed much earlier tradition. He even reminds us that Statius might have met St. Paul at Naples, associating with this possible, or later-imagined, occurrence, the well-known story of St. Paul's visit to Virgil's tomb at Pozzuoli.

Science.

SOME MODERN ASPECTS OF EVOLUTION.

Fifty Years of Darwinism. New York: Henry Holt & Co. $2.

Of the many celebrations called forth in this country by the fiftieth anniversary of Darwin's "Origin of Species," one only has so far been sufficiently ambitious to pass into book form—the addresses delivered before the American Association for the Advancement of Science in Baltimore on the first day of the year. Darwinism stands to-day for evolution as well as for the theory of natural selection, although evolution had long been advocated before Darwin. Darwin convinced the thinking world of the truth of evolution, partly through the large body of facts that he brought forward in support of this view and partly through his special theory of natural selection which attempted to give a reasonable explanation of the evolutionary process. While the doctrine of evolution is now accepted by practically all students of animals and plants, the theory of natural selection, as proposed by Darwin, has not met with the same universal acceptance, although it has received, in one form or another, general recognition as an important factor in evolution. These conclusions are well borne out by the opinions expressed in the present volume.

At the invitation of the Association, Prof. E. B. Poulton, a leading exponent of Darwinism, came to this country to give the first address of the series. The oft-told tale of the reception of Darwin's book, "The Origin of Species," is rehearsed by him with boyish relish. The battle is fought over once more to the everlasting discomfiture of the opponents of evolution and natural selection. And the conflict is at times turned into an attack on those within the ranks who, following after Darwin, have not accepted his special theory of natural selection as an all-sufficient and self-satisfying explanation of how evolution has taken place. Fifty years of Darwinism seems in Poulton's eyes to mean just fifty years of Darwinism, and nothing besides. That our conception of organic evolution has grown vigorously since 1859 does not appear from Professor Poulton's address, although without a single exception the following nine addresses make this point of view sufficiently apparent. The greatness of Darwin's achievement is better shown, we venture to think, by those who have carried forward the work as it was left

by him than by those of his followers who turn deaf ears to what students of evolution have done since his day.

In striking contrast to this somewhat lengthy "retrospect," the second address by Prof. J. M. Coulter on the standpoint of botany offers a vigorous and independent treatment of the indebtedness of that subject to Darwin. After a graceful acknowledgment of the influence of Darwin's work, which extends even beyond his formulation of the origin of species by natural selection, Coulter adds, "whether natural selection stands or falls as an adequate explanation of the origin of species, there can never be any doubt as to the breath of life it infused" into the study of descent. Coulter points out that, while at first botanists were captivated by the explanation of adaptation in plants through natural selection and showed great ingenuity in accounting for such fitness, the old explanations began to lose hold when it was found, for example, that thorns, supposed to have arisen because of protection afforded against grazing animals, prevail chiefly among plants in regions peculiarly free from such animals. The stinging hairs of nettles had been explained as built up by natural selection. It is now known that the nettle gets along very well without stinging hairs. Natural selection, Coulter concludes, eliminates species and individuals; it has nothing to do with selecting individual plants on the basis of some small, better adapted variation.

The influence of the environment in calling forth new types as a result of directly stimulating the germ plasma is urged by Prof. D. T. Macdougal. In support of this view he cites some of the most important recent experiments showing the effects of temperature and moisture, of injections of salt solution, and of radium emanations. The subject of this address is a matter of the greatest interest to students of evolution, since it bears on the most fundamental of all evolutionary questions, the origin of new variations that are "definitely" inherited.

The study of the inheritance of variations in its most modern aspects is dealt with by Prof. W. E. Castle and by Prof. Charles B. Davenport in two brief and interesting chapters. Castle explains exactly in the light of modern research the appearance of ancestral characters (atavism) when races are crossed, or when artificial selection ceases. Races of domesticated animals and plants have been produced by losing some one of the original characters. When two such races from a common source are recombined by crossing, the original conditions are once more fulfilled and the atavistic form reappears. Thus, for example, two races of white peas when crossed give the original purple pea of Sicily. A black and a yellow rabbit produce a gray rabbit—the color of the wild form from which the yellow and the black domestic races have sprung, each by the loss of a different character.

Definite variations are generally called mutations. Macdougal's account deals with such mutations produced by environment; Castle refers mutations to the loss or acquirement of single characters in De Vries's terminology. Davenport urges that evolution is due primarily to mutations, and not to the summation of fluctuations, and assures the reader that, were Darwin alive to-day, he would cordially accept the same point of view. The mutation theory is not, however, incompatible with the theory of natural selection, for there may be selection among discontinuous variations, as well as among quantitative variations. As though in anticipation of such an interpretation of Darwinism, Poulton points out, in the opening essay, that in 1864 the Duke of Argyle said:

> Strictly speaking, therefore, Mr. Darwin's theory is not a theory of the origin of species at all, but only a theory on the causes which lead to the relative success or failure of such new forms as may be born into the world. .

To which Darwin replied:

> I demur . . . to the Duke's expression of "new births." That may be a very good theory, but it is not mine.

Truly, the work of the reconciler is made hard.

Under the title of Adaptation, Prof. C. H. Eigenmann deals with the central problem of evolution. He brings to bear on this question his exceptional knowledge of cave faunas and the great adaptive changes that take place within certain families of fishes. Species become adapted by migration into congenial locations. Migration obviously is the important agent in evolution, not isolation, as Jordan maintains, provided the central problem of evolution is origin of adaptation rather than the "origin of species."

Isolation is urged by President Jordan as a primary factor in evolution. The importance of this factor has often been advanced before by those systematists to whom evolution means chiefly the formation of geographical races and species. But it is not evident that natural selection can have much concern with the formation of species, since specific differences have nothing whatsoever to do with useful characters. That the process of evolution (aside from the arbitrary definition of species) is concerned with fundamental adaptations rather than with superficial differences is self-evident. Granting that animals change with their environment and that isolation prevents intermingling and the production of intermediates, it does not seem to follow that isolation need have anything whatsoever to do with evolution of adaptive characters, for it is adaptive characters alone that natural selection pretends to account for.

In Darwin's day the relation of the egg cell to the body was by no means so clear as it has become in recent years. The vagueness with which Darwin conceived how the egg cell might be built up out of units (pangenes) received from different parts of the body of the parent, is pointed out by Prof. Edmund B. Wilson. A clear summing up of the evidence to-day is distinctly opposed to the theory of the inheritance of acquired characters advocated by Darwin as a subsidiary hypothesis to natural selection.

No chapter in the whole range of evolution has been more important than that which deals with fossils, as the strongest evidence that evolution, in some way, has taken place. Prof. H. F. Osborn brings to this topic his wide familiarity with fossil remains. He argues that the evidence is demonstrative in showing that evolution has progressed in definite lines. This view has been held by a number of able naturalists, but Osborn implies that these definite lines are often adaptive lines. Selection tries to account for the origin of such lines, but Osborn rejects selection as a sufficient explanation of the process and leaves the reader in doubt as to what the unknown cause of certain adaptive "origins" may be; for, while progression along lines that are not adaptive will be readily understood, progression along adaptive lines without selection and without the Lamarckian factor is something at present outside the scope of scientific demonstration.

In concise and strong statements President G. Stanley Hall brings the volume to a close with "Evolution and Psychology." The debt of genetic psychology to Darwin is generously recognized. Darwin is "hardly less the founder of a new departure in this field than in that of classification of form and structure."

> He posits a natural history rather than a philosophy of mind. . . . Finally, as Darwin freed biology from the inveterate dominance of the ideas of fixed and divinely created species, conceptions directly inherited from Plato's ideas and Aristotle's categories, so everything in the present psychological situation cries out for a new Darwin of the mind, who shall break the present spell of theoretical problems incapable of scientific solution, the ideal of a logical and methodical exactness greater than our subject in its present stage permits of, which Aristotle well dubbed pedantry, and remand the haunting problem of the ultimate goal of the psyche to the same limbo. . . . Only by so doing can we again get up against the essential facts of life as it is lived by the toiling, struggling men, women, and children, normal and defective, of our day.

Truly a wide range of subject and opinion; a fine tribute to the memory

of a great and independent thinker, even though much of what is written may be repudiated as not Darwinism by that narrow sect that claims to hold in fee the secrets of the master.

In "The Garden Yard" (Philadelphia: David McKay) Bolton Hall continues his apostleship to those city folk who try to support themselves in the country. The book teaches intensive farming to the home gardener, and instructs the beginner in market gardening. It discusses general farming topics, the various classes of vegetables, and poultry. For its size the book is very comprehensive, and its treatment of the subject is simple and practical. In his facts and advice Mr. Hall is up-to-date; his book should help to bring about the practice of intensive gardening which is to be the salvation of Eastern farmers and of suburban dwellers generally. Mr. Hall promises no millennium, however, to those who will not think as well as work. In an introduction N. O. Nelson urges the forming of coöperative farming settlements, and offers to finance them.

To those visionary souls who still take pleasure in naming the constellations we recommend a little book by Willis I. Milham, entitled "How to Identify the Stars" (Macmillan).

Raffaele Vittorio Matteucci, director of the observatory on Mt. Vesuvius, died there on July 16, from pneumonia contracted by exposure during scientific excursions at night on the crater. He was born at Senigallia, near Ancona, in 1866. Before succeeding the late Professor Palmieri as head of the Vesuvian observatory, he was assistant professor of natural sciences in the University of Naples. He had published a number of monographs on lava; on the *fumarole* and their products; on the phenomena exhibited by this volcano during the period between 1891 and 1895, and a work entitled "Come dovrebbe essere studiato il Vesuvio."

Drama.

EXAMINING THE EXAMINER.

The Examiner of Plays in England, George Alexander Redford, was for two days before the Joint Committee of Lords and Commons on the censorship, and his detailed testimony is highly enlightening. Whether it is more amusing than depressing, it is hard to say. The disclosure of the complete lack of taste in the officer who regulates national dramatic taste, and of the ignorance and want of fixed intellectual principles and moral sensibility on the part of the man who for fourteen years has decided what should and what should not be produced on the stage, must certainly compel a reform in the censorship, even if the result be not to reform it altogether away. None of the attacks upon it by playwrights and theatrical managers has damaged it so seriously as the two days' examination of the Examiner.

Mr. Redford, who, for the rest, appears to be a well-meaning and contented citizen, was asked by the committee to state his qualifications for his important task. Was he an educated man, a university graduate? Well, no, but "no doubt the Lord Chamberlain satisfied himself as to my competence." Had he engaged in literary pursuits previous to his appointment? Not exactly, though he had "dabbled in such things." What had he written? "If you wish to know, I have written several plays." Were any of them ever produced? Not one! What was his actual position before becoming Examiner of Plays? "I was a bank manager." How did he come to be appointed censor? Why, he was a friend of the previous censor, and had been in the habit of "acting for him when he was on holiday"! Mr. Harcourt, for the committee, then asked the question, which even Mr. Redford must have perceived to be ironical: "So the public were permitted at such seasons to see only such plays as the censor's friend thought it desirable they should see?"

The whole inquiry brought out the incompetence and confusion and vacillating uncertainties of the censorship in the most glaring way. Mr. Redford was asked on what principles he proceeded in determining whether a given play should be or should not be licensed. His reply was that he simply applied "the official point of view." Here is official art with a vengeance! But what was the official standard? Why, it was merely "custom and precedent." One sees how simple it is! A play of the kind that never has been licensed, never can be licensed, that is the whole of it. If there is in a play anything that the censor believes any of his predecessors would have thought indecent, or too personal, or offensive to the head of a friendly nation, or—oh, yes!—irreligious, that play cannot be produced in England.

Another positive rule was that no drama or opera could be "Scriptural." Mr. Redford was very strong on that point. But had he not recently licensed "Samson et Dalila"? Yes, but he had "stretched the rule" in that case. But there was one rule which was never stretched—the rule against immoral plays. How did he decide what were immoral plays? He was "bound by precedents—the unwritten law." But that unwritten law was precisely what the committee wanted to get at, and they plied Mr. Redford with questions. All in vain, however. He made it evident that he had no fixed standards whatever. Even in the matter of indecency, he had to admit that the worst plays of Congreve or Wycherley would have nothing to fear from the censorship, because they would come under the head of old plays not under the jurisdiction of the censor. Yet it was confessed that an indecent Restoration drama could not now be produced, simply because public opinion would not tolerate it. So there we have it—it is really the public taste, not the censor, that banishes the grosser plays from the stage. Quite apart from the question of an official license, there are standards and also laws—such as those against libel and against indecent exhibitions—which no theatrical manager could venture to disregard or violate.

In the end this whole question of licensing the production of a play seems cursiously like the question of licensing the printing of a book. Milton's argument regarding the latter would apply almost literally to the former. Indecent or libellous books he would leave to the law; and as for the impossible duties of the licenser, the language of the "Areopagitica" seems prophetic of poor Mr. Redford, with his 7,000 plays to read in fourteen years:

> It cannot be denied, wrote Milton, but that he who is made judge to sit upon the birth or death of books . . . had need to be a man above the common measure, both studious, learned, and judicious. . . . If he be of such worth as behooves him, there cannot be a more tedious and unpleasing journeywork, a greater loss of time levied upon his head, than to be made the perpetual reader of unchosen books and pamphlets. . . . Seeing, therefore, those who now possess the employment, by all evident signs wish themselves well rid of it, and that no man of worth, none that is not a plain unthrift of his own hours, is ever likely to succeed them, . . . we may easily foresee what kind of licensers we are to expect hereafter, either ignorant, imperious, and remiss, or basely pecuniary.

It seems plain that the testimony of the censor will be the undoing of the censorship. The evidence of playwrights and dramatic critics was unnecessary, after Mr. Redford had left the stand. His office may not be abolished, but it is sure to be reformed. Probably, the first step will be to allow an appeal from his decisions, which are now as final as they are inscrutable. Mr. Redford's innocent testifying to his own inconsistencies and ignorance was most diverting. He had refused a license to "La Città Morta," but had given one to the horrible plays of the Sicilian actors, because their manager had sent him a *précis*, and that seemed harmless. German plays he felt a little weak about, since he did not know the language, but his wife did. The *ewig Weibliche* in the censorship!

In Chapter i of "William Shakespeare, Player, Playmaker, and Poet" (John Lane Co.), Canon H. C. Beeching has tried to sum up as succinctly as possible the arguments in G. G. Greenwood's bulky volume, "The Shakespeare Problem Restated." In Chapters ii and iii he reprints lectures on Shakespeare's life and character. To this book Mr. Greenwood rejoins with "In Re Shakespeare" (John Lane Co.). Mr. Greenwood, making much of the spell-

Burlingame Public Library

ing *Shakespeare* as the *nom de guerre* of the author of the plays, and *Shakspere* for the player born at Stratford, argued with great detail in his first book to prove that the player could not have written the plays attributed to him. Yet he did not directly affirm the Baconian theory of authorship, nor did he attempt to identify the person concealed under the name *Shakespeare*. Point by point, Canon Beeching, as an enthusiastic Shakespearean, traverses this evidence. Point by point in his second book, Mr. Greenwood attempts to answer this attack.

Whatever else discussion of Shakespearean authorship may lack, it never fails to make one or all of the disputants irate. Canon Beeching talks of the "bluff" of Mr. Greenwood and accuses him of argumentative methods more worthy of an advocate than a judge. Mr. Greenwood retorts by animadversion on the pulpit and the cloth. All of which hardly advances the cause of truth. Canon Beeching is the more judicial, but he does not always distinguish clearly between facts and surmises or between imagination and real evidence. It may be questioned whether a writer who will devote a page to considering if, in the light of the plays, we may hold that Shakespeare drank tobacco, is the proper person to give the final destructive treatment to such a mare's nest as Mr. Greenwood has constructed. The mind for that must be relentlessly analytic and impartial. On the other hand, Mr. Greenwood is open to some extent to Canon Beeching's charge that he cares more to make his point than to search unswervingly for truth. He quibbles with his opponents, drawing off attention on special or minor points, and concluding as if he had answered or effectively weakened the whole opposing case. (See his treatment of Irving's argument against the Baconian theory, p. 112.) He also meets assertion with assertion, concluding as if he had proved something true. (See p. 62, as to the "Return from Parnassus.") He chooses the one witness among many considering a question who particularly favors his view, disregarding the immediate objection—for instance, in the case of Mr. Fleay—that this opinion of his witness changed so often and was sometimes, at first, so arbitrarily taken that it must be supported by other evidence or witnesses. (See p. 53.) He even uses the *argumentum ad hominem* against Canon Beeching, and then seems to conclude that he has proved something for the reader (pp. 72-81). There can be no question, then, that Mr. Greenwood's fervor as a controversialist leads him into strange ways. Nor does his exceedingly lame explanation, in an appendix, of his supposed discourteous references to Mr. Sidney Lee increase a reader's willingness to accept him as a whole-souled searcher for truth.

Art.

"Ghirlandaio," by Gerald S. Davies, which is among the recent Scribner importations, has the distinction of being the only separate work on the subject in English, and unless its successors are to be better, we hope it may long enjoy that solitary dignity. It belongs to that class of compilations which, falling short of thorough scholarship, are even more deficient in good sense and literary attractiveness. It is not so much that the author has not labored faithfully with his theme. The lack is less of diligence than of judgment. Relatively unimportant matters, such as the religious sincerity of Ghirlandaio, are labored at tedious length, while that most diverting and instructive document of the Florentino Renaissance, the contract for the Sta. Maria Novella frescoes, is merely mentioned in the text, though printed in the original Latin in an appendix. The magnificent portrait in the Louvre is passed in half a dozen lines; even more briefly the exquisite Giovanna degli Albizzi. On most matters of disputed attribution, Mr. Davies is inconclusive, though, contrariwise, he apportions between master and pupils the frescoes at the Trinità and Sta. Maria Novella with a certainty that excites wonderment. We have no space to enter into the various disputable matters. Symptomatic inaccuracies are not infrequent. On page 9 Masaccio's Crucifixion at Sta. Maria Novella is called an Annunciation. On page 14 Ghirlandaio's Salutation in the Louvre suffers the same transformation. We hope no enthusiast will be indueed to go to the Spedaletto at Volterra to see the fresco of the Forge of Vulcan, which is described as "ruined." Herbert Horne, eight years ago, found only slight traces of the underpainting. This work at Volterra, though described at second hand, is not mentioned in the chronological survey. It must fall, as Mr. Horne has shown in his "Botticelli," about the year 1485. On the other hand, the Last Supper, in the Badia of Passignano, which Mr. Davies catalogues as "lost," we saw in very tolerable, if repainted, condition about a year ago. We can commend little in this slipshod monograph except the clear type and the good cuts. If there is a demand for a Ghirlandaio book in English why does not some publisher take the obvious course of translating Dr. Henri Hauvette's admirable treatise?

The second volume of Dr. G. Carotti's "History of Art" (Dutton) bears the subtitle, "Early Christian and neo-Oriental Art, European Art North of the Alps." Excluding Italy, after the thirteenth century, it includes what is usually called early Christian, Byzantine, Saracenic, Romanesque, and Gothic art. A great amount of information, generally accurate and up to date, has been packed within small compass. The bibliography is full, though not exhaustive, the lists of typical monuments, in smaller type, very useful. The scope of the work may be inferred from the space given to Gothic art—something more than one hundred pages, as against about fifteen in Reinach's standard manual, "Apollo." The numerous small cuts are very clearly printed, and the little volume is handy for the pocket or satchel. It should serve well as a class book. A laborious verification of all matters of fact is naturally impossible, but in this regard the text meets casual yet crucial tests. It seems to us that the author gives himself a little too unreservedly to current and popular theories of the influence of Sassenid upon European art. We regret, too, his use of the term Carolingian, to cover all sorts of belated Byzantinism in and out of Italy. Taken broadly, it seems to us the best manual of the kind in the field. In their choice of a translator, however, author and publisher have been unlucky. Defects of idiom, sometimes obscuring the sense, occur too frequently. Geographical names appear carelessly in the Italian form, for example, "Monaco" (Munich), "Anversa," "Gand." A Gothic cathedral resembles a "carcase" (meaning skeleton), and, a few lines further on, a "carcass." Fresco and porcelain are used loosely for wall painting and pottery. In short the text has not had proper editorial supervision and needs a minute overhauling. It is fair to add that these defects are usually rather of taste than of substance.

Karl Hiersemann of Leipzig has issued Teil I, "Metall," of a work containing an abundance of rare but trustworthy information, entitled "Erzeugnisse Islamischer Kunst." This work describes and discusses in detail a collection of Oriental works of art, more especially of Persian-Islamic art, the description being given by the owner, Prof. Friedrich Sarre, with epigraphical contributions by Dr. Eugen Mittwoch. The collection appears in quarto form of 82 pages, with 10 tables and 54 illustrations, costing 12 marks. It is asserted that this is the only collection of the kind on the continent. Dr. Sarre has also in preparation Teil II, entitled "Seldschukische Kleinkuust," with 60 illustrations, of which 25 are photographs. It deals with one of the most interesting periods in the history of Islamic art.

An announcement has been received in Rome of the resignation of Prof. C. Hülsen, who for twenty-five years has been connected with the German Archæological Institute in that city. His retirement is due to his lack of sympathy with the policy of the Berlin authorities, who have reduced the sum allowed for the Institute library and have appointed a young scholar, a former pupil of Professor Hülsen, to the post of provisional first secretary. It will be remembered that Dr. Dörpfeld, the head of the German Institute in Athens, also sent in his resignation last year, for similar reasons, and was only persuaded to keep his post by the personal intervention of the German Emperor. It is alleged that the policy of the Berlin authorities is to neglect Roman and Greek archæology in favor of research in Persia and elsewhere in Asia.

F. Gutekunst of Philadelphia publishes a large photograph of Edward Everett Hale, which presents a striking likeness of the preacher-writer in his later years.

Finance.

AFTER THE TARIFF.

Three or four months ago, it was the commonplace of Wall Street discussion to find every prediction of prosperity conditioned on, or at all events limited in date by, the enactment and signing of the tariff bill. Sometimes the prophets promised a trade boom and a rising market "if a satisfactory bill passes," but more often "when the bill passes." Senator Aldrich, in a speech in April,

observed that "the era of prosperity is likely to continue uninterruptedly with the enactment of wise tariff legislation." Since numerous schedules of the Senate bill, which Mr. Aldrich fathered, have been thrown out in conference, it might have been questioned whether, on the condition above assigned, the promise regarding prosperity would hold good. But most of the prophets framed their prediction in the fashion of Mr. Schiff: "As soon as tariff revision is settled definitely, America will enter upon a period of unexampled prosperity."

There was some question, even in April, as to whether a country possessing, as seemed to be assumed, all the elements that go to make up prosperity, was usually in the habit of waiting for an arbitrarily selected event before its merchants and speculators adjusted themselves to the prosperous conditions. Had it been a question between a revolutionary cut in the protective duties and maintenance of the existing schedules, hesitation could be understood. No manufacturer, importer, or merchant could then make any plans for the future. But no such condition existed. Two or three weeks after the convening of the extra session on March 15, every one knew what the general character of the new tariff bill would be. There were some exceptions. Makers of gloves, of hosiery, and of certain lines of cotton goods, remained for some time in doubt; yet even their doubts affected the question whether their commodities would get higher duties, or not. The trade in which reduced protection was a foregone conclusion from the start—largely because of Mr. Andrew Carnegie's exploit at Washington—was steel and iron, and the iron and steel trade has been expanding in activity ever since the tariff bill was introduced. The same thing has been true of the dry goods trade.

As for the Stock Exchange, where prices, inferentially, were to hang fire until the enactment of the tariff bill permitted a boom, St. Paul stock rose 16 points between the convening of the extra session and the final vote, New York Central 18, Amalgamated Copper 20, Union Pacific 26, Steel common 30, and Reading 38. All this looked as if somebody was too impatient to wait until "tariff revision was settled definitely," or even for "the enactment of wise tariff legislation."

Nevertheless, the news of the passing of the bill last week was received in financial circles with interest and curiosity which were more than merely political. Probably nobody, on Wall Street at any rate, failed to ask himself whether this was not one of those strategic dates which should indicate our entry into a new chapter in the history of markets.

In recent years, there have been two notable instances of long-expected events whose occurrence is traditionally believed to have affected profoundly a financial situation. The Peace of Portsmouth in August, 1905, was one; the election of Mr. Taft in November, 1908, was the other. In reality, however, the bearing of these two events on trade and on financial markets was not precisely what most people imagine. If their effect on general trade is considered, there will be seen in each period a steady industrial improvement—due to recovery from a severe financial setback—which began long before either the peace treaty or the election, and continued afterward much as it presumably would have done had no such political incident intervened.

As for the stock market, the story differed oddly on the two occasions. High Finance had each time calculated, as implicitly as it did last April in looking to the tariff bill, on a "boom in stocks" to follow the good news, and each time the market had anticipated what was to come. When the news actually came, in the one instance as in the other, somebody sold stocks heavily to realize profits on the anticipated sudden purchases by the public; but the sequels differed widely. In 1905, the market was instantaneously and unexpectedly confronted with extremely tight money, and the rest of the year passed in a rather desperate struggle by the high financiers to maintain their speculative positions. In 1908, the speculating public snatched the market away from the speculating capitalists, and ran away with it so rapidly that the first word heard from the financiers themselves was a warning of disaster if the public did not stop.

Here are two interesting precedents. They are in many ways fair instances in point. In both, the industrial and speculative revival which theoretically was to follow the event had in fact preceded it, and that is equally true of the present case. In both, the event to which expectations had been pinned was one sure to happen, and that is even more true of the tariff bill land-mark. Last week's news was followed immediately by a sharp break in prices, and that, in turn, by a violent recovery, under the visible direction of the same interests as had been in self-constituted charge of the market all the summer.

This leaves it, on the whole, a matter of psychological rather than of economic interest, what is to happen next. Psychology does not yet rule the course of events in industry at large, but it is often supreme on the Stock Exchange.

The Utmost in 6% Bonds

Irrigation Bonds, when properly issued, form ideal investments. No other large class of bonds, based on equal security, pays *six per cent.*

Irrigation Bonds are secured by first liens on the most fertile farm lands in America. The loan will not average one-fourth the land's value.

They are additionally secured by a first mortgage on all that the Irrigation Company owns. Some are municipal obligations—in each case a *tax lien* on all the property in the district.

Where else can one find such ideal security behind bonds that net six per cent.?

These are serial bonds, so one may make short-time or long-time investments. And every bond paid off increases the security back of the rest.

The bonds are issued in denominations as low as $100, so they appeal to both small investors and large.

We are the largest dealers in Reclamation Bonds. During the past fifteen years, we have sold seventy such issues. Not a dollar of loss has resulted to any investor.

We have written a book based on all this experience—the best book of the kind ever published. Every investor, small or large, owes to himself its perusal. Everyone in these days should know Irrigation Bonds. The book is free. Please send this coupon today for it.

Important New College Text Books

Chamberlin and Salisbury's College Geology

By THOMAS C. CHAMBERLIN and ROLLIN D. SALISBURY, Professors in the University of Chicago. (*American Science Series.*) 8vo, 943 pp. + index, $3.50.

A one-volume text-book on the lines of the author's widely known three-volume work. Intended to serve as a basis for a half-year's work; but by the judicious selection of material may be used for briefer courses; or, supplemented by the numerous articles and treatises referred to in the text, it may be made the basis for more extended courses.

Rietz and Crathorne's College Algebra

By H. L. RIETZ, Assistant Professor of Mathematics in the University of Illinois, and Dr. A. R. CRATHORNE, Associate in Mathematics in the University of Illinois. 8vo, 255 pp. + index, $1.25.

Designed primarily for the freshman year in colleges and technical schools. Special attention is directed to the method of reviewing the Algebra of the secondary schools; the selection and omission of material; the explicit statement of assumptions on which proofs are based; the application of algebraic methods to physical problems.

The application of Algebra in advanced mathematics has been carefully considered in determining the subject matter.

The Nation.

NEW YORK, THURSDAY, AUGUST 19, 1909.

The Week.

The Western Republican "insurgents," both Senators and Representatives, have had triumphal receptions at home. It is clear that they understood perfectly the sentiments of their constituents, and represented them accurately. The strong Republican papers of the West continue to be amazingly outspoken about the shams and cheats that were left in the tariff, and to urge a continuance of the fight to get the frauds taken out. And the demand is that the work be done under Western leadership. Says the Kansas City *Star:*

> All of those Republicans in Congress who stood on the side of the people, who took the party platform and the President's campaign pledges in good faith, are Western men. And with these men and the spirit, the public sentiment, the public feeling, the national intelligence they represent, lies the hope of tariff revision, the hope of the elimination of corruption and graft and oppression from the tariff system.

Similar views could be cited from the St. Paul *Pioneer-Press*, the Minneapolis *Journal*, and the Topeka *State Journal*. We have plainly before us the beginnings of a new "Winning of the West" away from mole-eyed protection.

Attorney-General Wickersham, in announcing that he is planning to continue his official work while on vacation near this city, is quoted as remarking:

> The Administration policy to continue the prosecutions of corporations that are violating the Sherman act or have violated it is well enough known now, but I cannot, of course, say what plans for further action we may have.

This pronouncement is in line with Mr. Wickersham's previous declarations. We do not suppose it to mean that the Department of Justice is mapping out an aggressive general campaign against any class of corporations; but it is fairly to be inferred that the Administration is convinced that the need for close watch of attempted combinations in violation of the law is imperative. Such a policy has no inconsiderable relation to the new tariff law. It was an open secret that the Taft Administration, in answering the argument that the maintenance or advance of certain duties would increase the cost of living, took the general attitude that free home competition would prevent such an outcome. But, obviously, if the erection of a new tariff barrier against foreign competition were to be followed by domestic combinations to force up prices, this argument would collapse at once. It is the business of the Department of Justice to watch the developments in that direction.

Many complaints against the methods and results of different United States Censuses have been made by statisticians and investigators. Serious discrepancies have been pointed out between the figures of one census and those of another. There have been intolerable delays in editing and publishing the material. We have hardly got all the data of one census before the ten-year period has rolled by, and the time has come to take another. All this has led to an uneasy suspicion among students that our census-work has been only approximately accurate. This feeling has been shared by foreign scholars. Happily, the promise for the Census of 1910 is bright. Mr. Taft's letter to Secretary Nagel comes as near as is now possible to taking the census away from the spoilsmen. The appointment of supervisors and enumerators is to be made on a political basis—though even here the Democrats are to get half in several Southern States—but the actual appointees are to be under stringent orders to take no part in politics whatever, on pain of instant dismissal. This action by the President is a fitting sequel to that provision in the Census bill which, for the first time, put the permanent employees of the office under the civil-service rules. For that step in the direction of political decency, we were indebted to President Roosevelt, who met the schemes of the spoilsmen with a sharp and effective veto. The bill then failed for the session, but it soon became apparent that Mr. Taft would insist upon the same reform principles. Congressmen were forced reluctantly to retreat, and the small army of census clerks in Washington were finally brought under the rules. Original appointments are to be made only after competitive examination, and, once in office, a clerk is to be protected from arbitrary dismissal.

The replies made by national bank directors to Comptroller Murray's letter of inquiry, indicate how timely the circular letter was and how lax is the sense of responsibility frequently felt by those charged with the management of these institutions. Four per cent. of the directors admitted frankly that they knew nothing about their banks, while only 25 per cent. were ready to declare that they had personal knowledge of the real conditions of their banking business. In something less than one-third of these associations are loans and discounts actively approved by the directors, while, in the remainder, these functions are discharged by the officers of the bank. It is perhaps of less real importance that 80 per cent. of the directors admit that they cannot certify as to the genuineness of signatures upon business paper which the banks have discounted. But the disclosures are, nevertheless, highly unsatisfactory. Making every allowance for the plea that bank directors rely, and in large measure are forced to rely, upon the confidence they repose in each other and in their elected officers, the office is designedly a responsible one. Its due discharge requires a first-hand acquaintance with the bank's business much more intimate and extensive than at present prevails. The story told of General Lee is one that directors should take to heart. After the war, when the general was besought to lend his name to a concern with the assurance that he would have nothing to do and would receive $50,000 a year, the veteran declined upon the ground that if his name alone was worth that much a year, he must be very careful how it was employed.

With Mr. Gifford Pinchot's strong desire to conserve the remaining water powers of the country and prevent a water-power Trust, every one must sympathize. Public opinion has undergone a great change in this matter. Whereas it was formerly thought perfectly proper for any one to acquire water powers who had the means, it is now felt that they should not pass into the hands of

anybody save through a limited franchise or lease. Beyond doubt, both Mr. Roosevelt and Mr. Pinchot have represented in this matter enlightened sentiment. They seem to have gone about it at times in a thoroughly Rooseveltian manner by suspending or overriding the laws where they interfered with their public-spirited policy. Secretary Ballinger, himself a Western man, thoroughly familiar with the wishes of the Western people and formerly connected with the Land Office, believes in sticking to the letter of the law, perhaps because he is a lawyer of high standing. Mr. Pinchot, speaking last week before the Irrigation Congress at Spokane, uttered a protest against "legal technicalities"; in fact, his whole fervid defence of Mr. Roosevelt's conservation policy must be taken as a protest against the procedure of the present Administration. It follows several "muck-raking" articles in various magazines which have hinted that Mr. Ballinger stands for the "old régime" and is really working for the "interests" that prey upon the people. This we do not for a moment believe, any more than we can think that Mr. Taft is secretly and malevolently plotting to undo what was the best of his predecessor's policies. And, in fact, the statement given out last Friday in Mr. Ballinger's behalf by the General Land Office, would seem to leave but little of the contention that he has been giving away water powers to any one who knocked at his door.

It must have been a great shock to the New York legislative committee to learn, from the Republican Governor of Kansas and the Republican National Committeeman and leading Republican newspaper editors, that the Kansas primary law has eliminated bosses and all corrupt political influences. Yet this was the testimony they were compelled to listen to. Kansas would not dream of returning to a convention system; indeed, Kansans, who take such a great —mistaken, of course—interest in Gov. Hughes, find only one criticism of his direct primary suggestion—that it does not go far enough. "Eliminate every delegate" is the Kansas slogan, and the most critical and hostile New York committeemen will have to admit that the system has worked well there. They can only fall back upon the agricultural character of the Kansas population, if they wish to explain away this success.

Whatever the verdict in the inquiry into Lieut. Sutton's death, it cannot be denied that the Marine Corps has suffered grievously by the testimony as to the life the young officers affected were leading while stationed at the Annapolis school of instruction. They were supposedly there to learn to conduct themselves as young gentlemen and officers, instead of which they appear to have been a rowdy, hard-drinking, and fist-fighting lot, who thought that it comported with good manners to throw a comrade down on the floor and beat him until he threatened, and actually tried, to commit murder. More than that, there seems to have been a surprising lack of discipline, for officers were apparently on the most familiar terms with privates and sergeants. The Marine Corps has hitherto borne an excellent reputation; in efficiency and soldierly conduct it has ranked very high; higher in Cuba and elsewhere, than the regular army organizations beside which it has served. There are excellent and high-minded officers in the Corps, who must be deeply chagrined that in one batch so many undesirables were foisted upon it, and that the officer in command of the school was not able to subordinate and train them properly.

Nietzsche's "blond," whom he loved so much, and whose decline through the cunning of his darker rival he so much deplored, is, according to Dr. Charles E. Woodruff, surgeon and major in the United States Army, on the point of extinction. Our jails are full of blonds, he alleges, who have fallen into poverty, disease, and crime. Light hair and ingenuous blue eyes often accompany the pickpocket's dexterity and moral languor. Dr. Woodruff thinks the cause of this deplorable state of affairs is an excessive sunlight, which the sensitive blond cannot endure. Whether or not the blonds are a declining type, it seems to be a fact that they are, relatively to the brunettes, decreasing numerically. Even in German cities and towns, where one might expect to find the light-haired and blue-eyed Saxon and the sun-touched Teuton, increasing numbers of brunettes are to be seen. Blond women, indeed, are growing so rare, that, like some species of orchids and other delicate plants, they have a special charm for whole races of men, the French, for instance. Perhaps, too, the blonds may have some spiritual grace, often associated with the languor of early decline. But Nietzsche seems to have been a bad prophet.

Madame Maurice Maeterlinck, who is an operatic actress, has a plan to translate art back into the life from which it springs. She intends to produce "Macbeth" at her husband's château of Saint-Wandville, without a stage. The building is an old, castle-like affair, with architectural elements from the twelfth century. It is full of great corridors, huge rooms, an impressive banquet hall, and its environment is wild and secluded. The idea is, not to play "Macbeth," but to reproduce it. The banquet, for example, will take place in the actual banquet hall, the sleep-walking scene in the bedrooms, and there is a desert heath where the witches will weave their malevolent webs. If there are any spectators, they will be as the spectators of a drama in real life, who glide in and out of the scenes, to whom not all is revealed of the tragic circumstances, but who feel, vaguely, the indefinite horror of the events. This is realism with a vengeance, and suggests the ultra-æsthetic idea that nature is a copy of art.

No more difficult problem confronted the men who have been organizing a great and united state in South Africa than that of dealing with the native. There is, of course, some racial prejudice against the dark skin, and some horrible crimes have been committed there by white men, in the name of Christianity and civilization. But, on the whole, there is warrant for saying that the relationship between the races is cordial and friendly. The Boers are, perhaps, harsher with the untutored native than are the English. But even the Boers respect a native who has acquired property and shown himself a stable citizen, and admit him to their churches. Now the Act of Union contains a clause (No. 35) that "no person who . . . is registered as a voter in any Province shall be removed from the register by reason of any disqualification based on race or color." This does not, however, mean that there is to be manhood suffrage all over South Africa, for where the na-

tive is already excluded from the ballot he will, for the present, remain so excluded. As to the wisdom of this, there seems to be general agreement; but there has been a sharp difference as to whether the native ought to sit in the Union Parliament, which is to be the supreme legislature for South Africa. The Act of Union limits eligibility to British subjects of "European descent." Heretofore in Cape Colony the native has been eligible to the Cape Parliament, and, although he never made use of the privilege, he held it in high regard. That right he retains, but the Cape Parliament becomes now merely a local council.

Thus for the first time in history, the Cape native finds himself subject to a political disability because of his color. This is an entering wedge which has not only disconcerted the natives, but has led to vigorous and high-minded protests from men like Sir Gordon Sprigg, Mr. W. P. Schreiner, and others, who see here the jeopardizing of the "essential principles of free government," for it attacks "ministers of religion, editors, teachers, doctors, public servants, clerks, land owners, traders, and artisans." They believe, also, that it will be now possible, in some reactionary moment, to disfranchise these same persons solely because of race and color. The Imperial Parliament is not, however, going to interfere. The Ministry is satisfied that substantially as many rights have been given to the native as he possessed before, and that the question is a domestic concern which is best left to those most intimately involved for final adjudication.

There has been a happy interchange of views between the Anglo-German Friendship Committees of Great Britain and Germany, which affords evidence that not every one in England has lost his head in the invasion panic. The letter from the English Committee is signed by such men as its president, the Duke of Argyll, Lord Avebury, Lord Brassey, the Earl of Lonsdale, Herbert E. Maxwell, and Francis William Fox. It asks among other questions:

> Why should there be estrangement between our countries? Your heritage of culture is ours also. Your chief heroes and teachers are ours. All your highest aims and aspirations are shared by us. There may be rivalry, full and unfettered, in generous and pacific pursuits. Two nations had never less cause for strife, and never more for unity of spirit.

The Committee then assures its German friends of its readiness to do anything within its power to avert the terrible disaster of war, saying:

> We have put, and shall continue to put, before our countrymen, as we doubt not you will before yours, the supreme duty at this hour of resisting that spirit of fatalism which assumes that two nations of the highest intelligence, and masters of their future, must sooner or later become foes, and of combating the present propaganda of war with a no less earnest propaganda of peace.

The German reply is in the same high tone, and full of gratitude for the efforts made by the British Committee. It quotes anew the Kaiser's words, spoken at the Guild Hall in London in 1907: "The main prop and base for the peace of the world is the maintenance of good relations between our two countries . . ." and asserts that the great and ever-increasing burdens of militarism on both countries "can hardly be tolerated any longer." Among the German signers are Theodore von Holleben, Eduard de Neufville, and Wilhelm Faber.

The reason why Von Bülow was not anxious to dissolve the Reichstag appears clearly from the result of recent bye-elections in Rhenish Bavaria. The Social-Democrats gained in the first election more than 2,000 votes, while the National Liberals and the Alliance of Landowners lost, together, 3,000 votes, and the Clericals 1,700. Another vote being necessary between the Socialists and Liberals, the former won the election by 1,000 votes; many Clericals apparently voting against the Liberal candidate, whose party has now lost its last seat in Rhenish Bavaria. The result has, of course, created a great political sensation. It being an off-year contest, there was naturally a smaller vote than in 1907; but the significance of the outcome is not to be overlooked. The Liberals, who were a party to the *bloc* policy of Von Bülow, are beginning to feel the punishment they merit for compromising and abandoning the real Liberal principles. As for the increase in the Socialistic vote, the new and heavy taxation undoubtedly played its part, together with universal disgust at the delays and compromises in the Reichstag. While this district includes two considerable cities, they are located in an agricultural and highly conservative province. The warning was, therefore, the more unmistakable. The Socialist newspapers speak of it as only the beginning of a great day of reckoning.

Aristide Briand, who is described as the "first Socialist Premier in France," is the man most hated by the "radicals" to-day. Writers in *La Guerre Sociale* and *L'Humanité* regard him as the "lowest of mankind." The cause may be that he has "the advantage of having a little common sense," as Clemenceau once triumphantly maintained of himself in an encounter with Jaurès. Whatever the social philosophy of Briand and Clemenceau might be, if they were proceeding *a priori* to construct it, they as practical and executive men recognize, when in power, that it is a condition and not a theory which confronts them. As editors, Clemenceau and Briand were not too much troubled by the facts; as ministers, Clemenceau apparently has done his democratic best in guiding the State, and it seems that the "sadder and wiser" Briand will follow in the footsteps of his predecessor. His name is and will be anathema to his former friends; but that is a situation which, in the course of human affairs, eternally recurs.

It is difficult to arrive at the merits of the dispute between China and Japan over the question of the Manchurian railway. The Japanese case was first put before the public, and cast all the blame on the shilly-shallying of Chinese diplomacy. But Kipling has told us what anybody may expect who undertakes to make the Orient "hustle." China's reply, issued later, charges Japan with seeking more than she was entitled to, under the treaty, and of depending on her "military and naval superiority." This would seem to imply that the Mandarins are ignorant of the great American doctrine of the strong man armed who will neither suffer nor do injustice. One thing, at least, Japan has spared us, and that is a snuffling pretence that she is taking what she wants under an overpowering sense of Divine guidance. Western Christians, in their wars of conquest, have the great advantage over the heathen of being conscious servants of the Lord, when they kill and rob,

> They said their duty, both to men and God,
> Required such conduct—which seemed very odd.

"POPULAR" TAXES.

A revulsion of feeling over the new taxes proposed by the Liberals, is now going on in England. The cable dispatches but faintly reflect it. They state that the Conservatives are much worried to discover that Lloyd-George's budget is much more "popular" than they supposed. They have been attacking it tooth and nail, denouncing it as "fraud," "spoliation," and "robbery," but now they find that it is meeting with warm approval from large classes in the electorate. The Liberals have been unexpectedly winning bye-elections on the issue of the budget, and a general chill has fallen upon the divided counsels of the Conservatives. One of their own newspaper organs, the *Daily Mail*, plainly tells them how the tide is running. It says:

> What the Unionist party scarcely seem to realize is that the mass of people whose envy and cupidity Mr. Lloyd-George seeks to arouse are not versed in politics and stagecraft. They cannot see through the flimsy fallacies of socialist argument. To a large number of them the Chancellor of the Exchequer appears with the halo of his own creation as the friend of the poor man, the sworn foe of injustice in high places, the humbly-born castigator of the idle rich. Among those who watch most closely the fluctuations of public sentiment there is a pretty general agreement that during the last few months the position of the government has been strengthened.

The immediate reference is to an extraordinary speech which Lloyd-George has just made in London. It was, affirm the shocked Conservatives, a performance such as no previous Chancellor of the Exchequer could have been capable of; and they are right. It was a fighting and inflammatory speech. Lloyd-George carried the war into the enemy's country in dashing style. In explaining his new land taxes, he ridiculed the Dukes, and held the landlords up to scorn, amid the uproarious applause of his audience. He asserted that his opponents were making the greatest political blunder in history, when they assumed that the land-owner was beloved in England, or that it would be a shrewd or safe thing for any party to set itself up as the special champion and defender of the landlords. Describing himself as "a son of the people," Lloyd-George declared that he should see to it that the very rich should be compelled to pay their just share of taxation. In this kind of campaigning, the Chancellor of the Exchequer is ably seconded by Winston Churchill, who has been speaking with great boldness and vigor, and declaring that the Government would not permit such a "crime against the British democracy" as would be "the slightest mutilation" of the budget by the House of Lords. Mr. Churchill has also announced a scheme of workingmen's insurance by the state, after the German model, to be introduced next year; and it is plain that the leading spirits of the Ministry are preparing to throw themselves bodily upon the middle-class and labor vote. As the signs multiply that the new taxes are "popular," the drift that way will be more marked.

Over the mere proposal to make a beginning of taxing the unearned increment in land, there seems no sufficient reason for all this excitement. It is a tax which has been advocated by eminent economists and leading statesmen in England. Joseph Chamberlain himself advocated it in 1885. Before that date, a Royal Commission on land taxation had made a report favoring a tax on the increment much more extreme than the one now urged by Lloyd-George; and that report was signed, among others, by Cardinal Manning and the present King of England, then the Prince of Wales. Proposals with such a weight of authority behind them, and with the endorsement of John Stuart Mill, seem hardly to deserve such a violence of epithet as the Conservatives have been bestowing upon them. But it all comes from flinging the measure into heated politics. In the circles where they move, and in the ranks of their own followers, Mr. Balfour and Lord Lansdowne found the new land taxes intensely unpopular, and so they seized upon them as another stick to beat the Liberals with, speaking of them, as Sir Edward Carson has done, as "the beginning of the end of all rights in property," "the satiation of greed," and "a war of the classes." Such extravagance of language begets equal extremes in retort; and the result is that England is torn with passion over a question of taxation that should have been broached and settled with scientific coolness. The whole matter is expected to turn on the fact whether the taxes are "popular" or not.

A good and just tax may be popular; but so may one that is ill-advised and oppressive. A sober statesman will look beyond any such external test. He will inquire whether the proposed tax is one sound in principle, equitable in operation, and such as will not do more to harm business and the good relations of the classes in the community, than it will do good in helping the revenue. But for the politician, it is enough to know that the people's fancy is caught with the new taxation. That was the real argument by which the corporation tax was passed in our Congress. It would be a "popular" tax, therefore necessarily a good one. But that remains to be seen. What we already know is that sound finance and wise taxation cannot be as fickle as the caprice of the crowd.

SCIENTIFIC SPECULATIONS.

If modesty is ever seemly, it is where the layman stands in the presence of the man of science. When the ultimate nature of physical phenomena is under discussion, we feel as did Thackeray when his story reached the battle scene. Like him we salute the military novelist and retire below decks. It is only when a man of science himself takes up the criticism of prevailing theories in physics that we dare to venture out under the shelter of his guns.

It is true that long before Prof. L. T. More's paper on "Atomic Theories" appeared in the *Hibbert Journal* for July, we had bemused ourselves over recent tendencies in science. Few who have been graduated from college in the last quarter of a century will forget what an impression of finality they received from their instruction in physics and chemistry. The professors of these subjects used to refer in sportive satire to the lack of definiteness and the endless flux in the humanities. Science towered on high, with its *quod semper, ubique, ab omnibus* disdain. It, at least, dealt with knowledge untainted by human passion. And yet in the last two decades rumors of radical change have reached the ears of the old alumnus; stories of jangling schools of theorists who wage battle over the inmost mysteries of nature..

Professor More, in the paper referred to, contrasts the scientific procedure and the scientific precision reached in mechanics, with this speculative chaos now obtaining in the realm of molecular physics. The units of measurement in the physics of ponderable matter are based upon and verifiable by sense perception. Mass, length, and time are all

magnitudes related to experience. With the aid of the Cartesian geometry and the calculus, the motions of bodies and the interactions of bulky matter are capable of solution. The paths they traverse and their velocities can be formulated quantitatively. In terms of energy, an explanation can be offered of the agencies which move them. To this Newtonian legislation all bodies on the earth beneath or in the starry heavens were and remain subject. Once the positions, velocities, and masses of any system were given, its past or future could be calculated with precision. But when in the last century the phenomena of light, sound, heat, electricity, and magnetism came under investigation, the method of science, as Professor More demonstrates, showed a tendency to change. The bodily affections of color, pitch, temperature, and electrical charge were not susceptible of the exactitude of measurement possible in the case of molar physics. Most properly, therefore, these phenomena were reduced to terms of energy as measured in mechanical units.

Had the process been content to stop here, there would be no ground of criticism. But with the study of these less tangible phenomena, a new scientific method crept in. Hitherto phenomena had supplied the raw material of study. But increasingly from now on a hypothetical method of conjecturing the nature and activity of the ultimate constituents of matter began. Newton had held aloof, with his *hypotheses non fingam*, from speculating on the inner nature of the agency causing universal attraction. But in the matter of light he conjectured that minute corpuscles were flung off from luminous matter—to the retardation of the development of optics for a century. But undeterred by this scientific miscarriage, the modern physicist revels wildly in the imaginative creation of ultimate constituents of matter and its environment—molecules, atoms, ions, electrons, protions, corpuscles, æthers, and what not—and proceeds by experiment to confirm his guess or to change and elaborate his conjecture as the experimental test requires. He ends up, after piling hypothesis upon hypothesis, with a molecule which is itself "an aggregation of particles, each vastly more intricate than the stellar systems, and whirling around each other with a motion approximating a hundred thousand miles per second."

The use of this method within limits is perfectly valid; but its prevalence is fraught with grave danger. In the first place, fictitious entities are assumed not perceivable by the senses. So long as experiment does not invalidate the assumption, the hypothetical creations grow in reality to their inventor until, as Professor More puts it, "the esseutial differences between hypothesis and fact, between metaphysics and physics" disappear. One distinguished physicist declared to our author that "we know far more about the ether and the atom than we do about sensible matter." To which the proper retort was given that "a Frankenstein might say of a mechanical man which he had conceived and constructed—I know more about him than I do about a real man." A second danger inherent in the prevalent method is the assumption that the internal, intrinsic, essential nature of matter's ultimate make-up is knowable at all. So far as physics has progressed, it has been by reducing observed phenomena to regular coexistences and sequences. All analogy would seem, therefore, to favor this process rather than to attempt to penetrate into the geometrical shapes of ions, or to discern whether they are spheres or disks, as certain savants in Germany are now trying to do.

But the serious aspect of the matter is not the procedure of science itself, but the effect of such studies in the training of young minds. The question is whether a science based on such hypotheses does not tend to dull that conscious distinction between what one knows and what one does not know, which is almost the highest aim of education. It would be a strange reversion if we should find in the end that science, at least as it is coming to be taught, differs from poetry in not knowing the difference between fact and fancy.

FAIR AND FOUL-WEATHER YACHTS.

It would be a misfortune to American yachting if the rough experience of the New York Yacht Club, in its sail around Cape Cod, should act as a damper on future open-water cruising. We have no desire to make light of the hardships the boats encountered. There is no stretch of coast more trying in a blow than that of Cape Cod, from Hyannis to Provincetown. The dangerous shoals from the Vineyard to Chatham make every navigator breathe more freely when he is well into Massachusetts Bay. Only the other week two big merchant schooners grounded in sight of Chatham, under much better weather conditions than the yachts ran into. In that stretch of water a forty-mile breeze brings with it anxieties which would not be felt under other shores; and for this reason, as well as the saving in time, navigators hope for an early completion of the Cape Cod ship canal, that the Cape may lose its reputation as a graveyard for vessels.

Granting that the weather was bad and the coast dangerous, the yacht fleet's experience is bound to raise the old question whether our racing craft are not too often machines built for competitions on Long Island Sound in moderate breezes, and therefore oversparred, with insufficient hull-strength for anything like a deep-sea wind. Under the new scantling restrictions, the hulls of the present-day racers beyond doubt mark a great improvement over the time when imitations of Columbia and Defender were all the rage. But boats like the 57-footers and most of the racing schooners are still far better off in port than at sea on a wild night. Now, we are not of those who would insist that every racing boat should be fit to cross the ocean, but we do maintain that if yacht-racing is to do for the sport all that it ought, the average racer should be stanch and seaworthy enough to go out in a 35-knot breeze, or to take care of itself properly in a sudden blow. Too often races are postponed because of the wind, when our English rivals would laugh at the suggestion that they should stay at anchor. Curiously enough, the big boats are often the least eager to sail in a blow.

The difference in the types of boats is best illustrated by the performances of Elmina and the little Eleanora. The Elmina led the fleet in because she was a stanch, sea-going, and at the same time, a fast boat, combining all the desirable qualities. This was to be expected, because her designer, Mr. A. Cary Smith, has long been turning out just that kind of craft, even when his boats are built to race. Eleanora, on the other hand, is a racing boat pure and simple, a fine light-weather performer, but far too heavily sparred and

with too frail a hull for such seas and wind as she met off Cape Cod—only to lose her mast. It is distinctly the Elmina type of boat that our yachtsmen should pattern after, and we believe they will more and more as the evil influences of the last America's cup racers fade further into the past. Those were skimming dishes, pure and simple, built for summer weather, on one particular course, and, as we pointed out then, bound to have a noxious influence. For what the sport ought to turn out is *sailors* able to take care of themselves at all times, and uot mere racing-masters at ease only in light breezes in land-locked waters.

Something of the same problem has recently developed in motor-boat racing. The Bermuda race of motor boats this year is believed to have been the last of its kind, and its founder, Mr. Thomas Fleming Day, has recently felt himself compelled to denounce the present generation of yachtsmen as a "crowd of weaklings and degenerates." But Mr. Day, we think, misses the point. There is bound to be a much greater difference between the ocean-going motor-boat and that built for every-day cruising, than between the sail-racer and the sail-cruiser. The ocean-going motor-boat needs, for instance, greater storage capacity, stronger engines, than the ordinary pleasure craft, and sufficient sail-power to crawl into port in case of the disabling of the engine. So far the Bermuda race has aroused interest largely because of the venturesome danger of going to sea in boats never built for that purpose, with one exception, Ailsa Craig. This is, again, an A. Cary Smith craft, which has since been turned into a tow boat for a racing sloop, for which purpose her exceptionally heavy hull and strong engine admirably fit her.

A motor vessel admirably fitted for ocean racing is now in service on Cape Cod. She is absolutely unsinkable, being divided into nine watertight compartments, and having every mechanical and engineering device ingenuity could devise. Yet she is wholly lacking in the accommodations necessary for comfortable long-distance cruising. There is no doubt that she could be driven around Cape Cod in a winter's gale with perfect safety. But this exaggerated type of decked life-boat is not what the ordinary yachtsman wants. In racing, whether motor-boats or sail-craft, the desirable thing is a boat in which its crew can have confidence even when caught in a blow and driven miles out to sea. Experiences of this kind come to every yachtsman and are dreaded by the right sort of amateurs only when they are sailing a freak of more than doubtful sea-going qualities. We do not agree with Mr. Day that "the large boat-owners have degenerated into a lot of pond sailors whose only ocean lies between Larchmont and Glen Cove." But we do believe that if we are going to develop real sea-going sailors, like the English amateurs, the first requisite is a safe and sane type of boat, that can take punishment proportionately as well as do the Gloucester fishermen.

LETTERS IN BIOGRAPHY.

Since Meredith's death, all kinds of reports concerning a possible biography of him have been in circulation. His own wish was said to have been strongly against the writing of any Life at all. There was the story that he had warned his friends that he should "haunt" any of them who might venture to assume the rôle of biographer. Also, we had the picturesque accounts of Meredith burning a lot of his private letters, just as Browning and Tennyson were said to have done when Froude's Carlyle was published, and likewise rumors that he had expressed the desire that any who were in possession of letters from him should similarly destroy them. Now, however, the whole matter is put in a new light. Mr. William Meredith has sent a note to the newspapers, requesting the loan of such letters of George Meredith's as may be in existence, for the purpose of publication under the editorship of John Morley. It should seem, therefore, that we are to have "Letters," even if not a "Life."

It would be idle to speculate on the value of such a collection of Meredith's correspondence. The fragments of his letters which have already appeared in print are interesting, but not distinguished. They do not argue that he would take his place among the great letter-writers. Many a man has been in essay or poem powerful, but in letters contemptible. We would not say that this was true of Dr. Holmes or Matthew Arnold, but certainly their published letters were disappointing: they did not seem level with their formal writings. On the other hand, no one could have foretold from Cowper's literary performances that his letters would be such a monument to his fame. However it may prove with Meredith in this respect, the printing of specimens of his private correspondence should aid in solving the problem of his style. Critics will be anxious to see whether he wrote to his friends in as labored a form as he used when addressing the public. Probably, it will be found that Meredith's writing was much of a piece, whether hurried or studied, and that his style was *de l'homme même*. This is known, for example, to be the case with Henry James. The idiosyncrasies of his writing in novels and essays, which some innocent folk imagine him as fabricating with endless and patient toil in his books, are so the habit of his thought that they drop from him spontaneously when writing—or dictating, as he does by preference—the most unpremeditated private letter to a friend. We imagine it will prove so with Meredith.

It is, however, not literary form, but personality, that we most desire to study in the letters of a well-known author. It is the living picture which they present that makes up the fascination of letters in biography. And, as a rule, they are the best and most vital part of any biography. When Coleridge said that literary executors have a way of màkiug havoc with the brains of the man whose Life they undertake to write, he doubtless had in mind the way in which too many biographers obtrude their own judgment or prejudices. They do not let the man himself speak. But this he does in any copious publication of his letters. In them, he is not merely off his guard, and revealing himself as he is, but escapes the misinterpretation, or inability to understand, of his biographer. Of course, even letters have to be edited with discretion. The mere fact that a famous man has written them is no uecessary warrant for their being given to the light in mass. George Russell is much to be blamed for some of the American letters of Matthew Arnold which he published. They gave great and needless offence and pain. If they had been written about English people, Russell would have edited them more carefully, or suppressed them; but he seems to have made up his mind in

a sort of Luther spirit that, reflecting only on Americans, they were "good enough for the Galatians." Nothing of the kind need be feared in the instance of Meredith's letters, if they are to be edited by Lord Morley.

Many nice problems of editorship arise in connection with printing the letters of great writers or statesmen. If their after-fame bulks large enough, we get the complete edition of their works, in which the "Letters" stand by themselves, filling volumes, as with Swift or Walpole, Franklin and Washington. Editing, in such cases, reduces itself to arrangement and explanatory notes. But ordinarily the difficulty of the editor is to winnow out, in the first place, the letters that ought to be printed, and afterwards to set them properly in the frame of the "Life and Letters." The older fashion was to put the biography in the first half of the book, and then to lump the letters at the end. This too much severed the two parts. To avoid this, the practice was adopted of stringing the letters along at the end of each chapter. Even then, the reader had to be turning back and forward all the time. If letters are freely used in the narrative proper, the effect is more pleasing, but frequently tends to break up the consecutiveness of the story. There is also the question whether letters should be grouped chronologically, or by subjects, or correspondents. Each way has its awkwardness at times, and the most skilful editing is that which varies the method, as interest or entire impression requires, not following throughout any too rigid plan. But however they may be presented, we all agree, despite the regularly recurrent complaints about letter-writing having become a lost art, that letters constitute the great charm of biography.

NEWS FOR BIBLIOPHILES.

Of the many rare pamphlets by Thackeray or with which Thackeray was associated probably the rarest is that first (and only) number of the *Whitey-Brown Paper Magazine*, being a series of lithographs from his drawings, with explanatory text by him. This is undated, but was probably printed about 1838 or 1839. That first number must have been an experiment only, as no more, so far as known, were ever published. The copy, which belongs to Joseph Grego and is mentioned by him in his "Thackerayana," published anonymously by John Camden Hotten in 1875, now belongs to Major William H. Lambert of Philadelphia. The drawings were also reproduced in the *Autographic Mirror*, a curious periodical made up entirely of lithographed facsimiles of manuscripts and drawings (Vol. I, 1864). They next appear reproduced from the *Autographic Mirror* in the "Miscellaneous Essays, Sketches and Reviews" (1886), which forms Vol. XXVI of Thackeray's collected works.

As Grego points out, the purpose and aim of the caricatures was to hold up to ridicule Dr. Dionysius Lardner, voluminous writer on natural philosophy and editor of the "Cabinet Cyclopædia," and Lardner's friend Sir Bulwer Lytton. These two gentlemen were connected with the *Literary Chronicle*, a rival of *Fraser's Magazine*, to which Thackeray was an important contributor. In this probably lies the explanation of Thackeray's series of caricatures. The same matter forms the subject of "Mr. Yellowplush's Ajew," published in *Fraser's Magazine*, and afterwards included in "Comic Tales and Sketches" (1841).

The features of Diddler throughout are, it is said, a faithful likeness of those of the eminent philosopher, Dr. Lardner. The illustration of "Mr. Shortman" is a caricature portrait of the head of the publishing house of Longmans & Co., and "Sir Hinry Pelham" is, of course, Bulwer Lytton.

The original drawings were formerly owned by Joseph Grego, editor of the two Thackeray volumes, "Thackerayana" and "The Student's Quarter," and were exhibited by him in four oak frames under glass at the Victoria Era Exhibition at Earl's Court, London, in 1897. These have recently been acquired by a Chicago collector.

Correspondence.

PERSONALITY IN POLITICS.

To the Editor of The Nation:

Sir: Mr. G. Bradford's letter on "Personality in Politics" in the *Nation* of August 5 is as interesting as it is scholarly, and its statements and implications might well command attention and discussion by that portion of the press which serves as an independent forum for the general public.

All history shows that it is personality which initiates any change in crystallized convention; but as soon as the alteration is effected it is convention that disowns personality, and at least ignores it, if it does not, overtly or covertly, aim to crush it out. This is true not only in politics, but in all the other fields of human activity or aspiration. All I propose to say on the subject at present, however, is in reference to an observation of your correspondent apropos of the decade immediately preceding the outbreak of our civil war.

Your correspondent never, surely, would have said that "up to the firing upon Fort Sumter *neither* side had hardly more suspicion of an impending war than they have now," if he had ever read "The Impending Crisis," by the recently—and unhappily—deceased Southern writer, Rowan Helper, an impressive output, considering its source, and published a year or two before the war began, or—a still more striking example—"The Partisan Leader" (I think that was its title), a romance based, according to my recollection, on a prophesied war, successfully waged by the South against the North for its separation from the latter. This volume was published, I think, as far back as some year in the early thirties, and, I may mention incidentally, was lent to me, with a recommendation to peruse it, by Prof. Alexander Dallas Bache, a grandson of Benjamin Franklin, and the chief of the Coast Survey. Prof. Bache was the vice-president of the United States Sanitary Commission during the war, and I was its assistant secretary. Both of us resided in Washington, and my Sunday evenings were generally spent under the chief's hospitable roof, where, from the lips of other habitués, chiefly officers of the navy, army, and civil service, and some of them Southerners who had retained their allegiance to the United States government, I heard many an anecdote illustrative of the fact that the majority of the young Southerners of that generation had been brought up to consider a war with the North, in defence of their property and methods, based on the "peculiar institution," as something for which it behoved them to be prepared.

My duties, too, brought me into not infrequent contact with wounded and sick Confederate officers and men in our Union hospitals, or in our ambulances when, at the front, I was with sections of our armies, "on the march"—they for the line of battle or for the base and I for incidents to serve for my periodical letters as "supply correspondent" with the commission's various branches throughout the loyal States. Among these Confederates I found many confirmations of the story of a long-time prevalent anticipation in the South of Seward's "irrepressible conflict."

I had, indeed, just before both sides took up arms for the *bellum lethale* that followed, quite realized that a fratricidal strife was upon us. For it happened that in the autumn and winter of 1860-1861 I lived in the same boarding house—kept by an Italian lady—with a lot of young Southerners studying medicine at the adjacent medical college in Fourteenth Street, New York. (By the way, one of our fellow-boarders among the few whose lines were cast in the North was the afterwards distinguished musical director, Theodore Thomas.) Before sitting at table with these young scions of the "Sunny South" I had, like most residents hereabout, counted the war talk of their like as mere sophomorical bravado and bluff. But at close and continuous quarters with this party—mighty pleasant and companionable young fellows they nearly all were—I realized that I had been mistaken; and when I exchanged friendly adieus with them in the spring of 1861 it was in the full consciousness that they were in dead earnest in averring they were going home to join Confederate regiments to fight us.

Your correspondent is entirely right, so far as the North was concerned. Except among a very few more observant and long-headed men, much more familiar with the South and better read in history than the mass of those north of Mason and Dixon's line, the war talk by those south of it during the decade of 1850-1860 was regarded as huncomb; but his statement as regards the brave upholders of what, from their point of view, were their rights, is contrary to historical facts. The next

decade, with its "cruel war," its "lost cause," and its needless and, for the hapless Southerners, bitterly humiliating "reconstruction" period, clearly demonstrated that however great and—mainly on their own account—deplorable their mistake in ignoring the humanitarian tendencies of their generation, they had at least been in earnest, and deserved sympathy for the losses and sufferings they had gone through. And what candid and benevolent mind now refuses respect for the South's devoted stand in conscientiously defending, against the equally brave and conscientious North, what the former regarded as its lawful dues? A. J. Bloor.

Stonington, Conn., August 11.

A RELIC OF CHARLES LAMB.

To the Editor of The Nation:

Sir: Amongst my books—phrase dear to the bookman's heart—is a "Rhymed Plea for Tolerance," which was published by Edward Moxon in 1833. It is a well-intentioned effort now entirely forgotten. Excellent as are its sentiments, and fully as I approve of them in the main, it is doubtful if this particular copy would remain on my shelves but for its association with Charles Lamb. For it was once in his possession, and was presented by him to Thomas Westwood, the Arthurian poet and scholarly angler. It formerly had Lamb's autograph on the flyleaf, until some foolish—to use no harsher adjective—autograph hunter cut this away. But he has not succeeded in spoiling the identification of the book with Elia, for the inscription, perhaps written with a pencil or stylus, has left a shadowy impression on the title-page, and at a favorable angle of light there can be read the words: "T. Westwood Jun from C. L.," in the characteristic handwriting of the gentle spirit who called up for us "the old familiar faces."

The "Rhymed Plea" is anonymous, but it is known to have been the production of John Kenyon, a verse-writer and philanthropist, who enjoys the distinction of having been one of the aiders of Coleridge's family. He was on terms of friendship with Wordsworth, Southey, Ticknor, Bayard Taylor, Barry Cornwall, and Walter Savage Landor. To him Browning dedicated his "Dramatic Romances and Lyrics." Crabb Robinson says that Kenyon had "the face of a Benedictine monk and the joyous talk of a good fellow." When he died in 1856 he bequeathed £10,000 to Browning. His verses are often graceful, but they lack force, and do not greatly grip the mind. As an admirer of Pope, to whom he says

> . . . belong
> The heights at once of satire and sweet song,

he wrote his dialogues in Pope's metre. They are almost monologues. There are some vivid reminiscences of the scenery of Jamaica where Kenyon was born, and it is not without interest to hear of his induction into the pleasures of literature. After the horn-book,

> The Muses came with that expanding day,
> First pious Watts, then—a strange transition—Gray!
> A chance-found book! Oh! how I loved to read
> Of Kingly Odin and the coal-black steed—
> The gory shuttle tossed from hand to hand,
> And all the mysteries of that Runic land.

From Gray he passes to the Bible, Homer, Rogers, Shakespeare, Dryden, and Milton. He describes himself as having "all but took the desperate plunge—in ink," but perhaps was checked by the fear of "the Demon of review." "The Plea" may be summed up in its concluding lines:

> . . . howe'er each sect may brawl,
> Where pure the life, where free the heart from gall,
> Whate'er the creed Heaven looks with Love on All!

How did this book come into the hands of Charles Lamb? The clue is given by Westwood in the delightful reminiscences of Lamb, which he contributed to *Notes and Queries* (3rd S., X, 221):

> There were few modern books in his collection, and subsequently such presentation copies as he received were wont to find their way into my own book-case, and often through eccentric channels. A Leigh Hunt, for instance, would come skimming to my feet through the branches of the apple tree (our gardens were contiguous); or a Bernard Barton would be rolled downstairs after me from the library door. "Marcian Colonna" I remember finding on my window-sill, damp with the night's fog; and the "Plea of the Midsummer Fairies" I picked out of the strawberry bed. It was not that Lamb was indifferent to the literary doings of his friends; but their books were unharmonious on his shelves. They clashed, both in outer and inner entity, with the Marlowes and Miltons that were his household gods.

Doubtless the "Rhymed Plea for Tolerance" was a presentation copy to Lamb, who, finding it no fit companion for Fuller's "Worthies" or for Beaumont and Fletcher's plays, passed it on by direct or devious paths into Westwood's young and willing hands. And now it has a cherished corner "amongst my books" for its autograph, or simulacrum of an autograph—a ghostly and shadowy relic of the gentle Elia.

William E. A. Axon.

Southport, Eng., August 6.

TOO MUCH EDUCATION.

To the Editor of The Nation:

Sir: We have insisted upon free education, education for all, compulsory education; all sorts of ologies and what not have been injected into our educational systems, and what is the result?

In the first place, our anxiety for so-called education, a diversity of accomplishments, has been such that our children have no idea of thoroughness, they cannot spell correctly, they know little of any of the fundamentals, they have been taught to skim over the surface of things, a smattering of a subject has been accepted as a satisfactory attainment, frivolity is encouraged, a frivolity that sticks all through life, in matters of the greatest importance. Then, too, so much is attempted in our schools that the youngsters believe themselves all candidates for college and higher things; ours is a race of embryo Presidents, Senators, captains of industry, directors, and managers. All believe themselves above working with the hands, headwork only is fashionable, and the least possible of that. Our farms are abandoned, the young people flock to the cities, they cannot, will not, do manual work, they must teach or be typewriters or petty clerks pro tem., awaiting the time they can be enrolled upon the lists of the great. Our trade-unions further complicate matters by limiting the number of apprentices in each trade and otherwise making those trades hard or undesirable to get into.

The farm, the shop, the mine, are as much part of the State communal body as is the office, the bank, or the shop. The State should not discriminate between these and help one at the expense of the other. It is doing that now by its free education; it is pulling people away from the farm and the workbench and fitting them exclusively for work requiring scholastic attainments. All of its grade schooling is planned as preparatory for high school, and the high school is managed as a stepping-stone to college. The State is really to blame for existing conditions, though it has erred in judgment and does not lack in good intent. By its excess of education, so to speak, it has vulgarized the sciences. It has tried to bring everything down to the lowest level of comprehension; it has made millions of mediocrities, people partially or dangerously little educated, but it has given us few, distressingly few, brilliant minds and thorough scholars. Indeed, it has been contended that many of our criminals have become such because of compulsory education; they had to read and naturally turned to debasing, demoralizing reading that in turn led them on into evil. Had they been compelled to work without knowing how to read, they might have turned out better.

Are we to face about and seek to re-create a peasant, a laboring, and uneducated class?

No, but it should seem that something could be done to correct the wrong that is so apparent all around us.

The State has got us into this pickle, now it is the State's duty to get us out of it. Let there be less education and more instruction in the primary grades, more character-building, a training to get the child into the way of learning and applying what is taught. Let there be less kindergarten and playful frills and a more thorough grounding in the rudiments, the three R's. If the child is fitted by nature for a professional career, he'll go on, never fear; if he is not, why should the State tempt him into it, and spend its money and waste his time trying to make a doctor or a preacher out of him, and perhaps spoiling a good farmer or butcher?

The State provides the education, why should it not dispose of it to its own best advantage? Is not that its duty as representative of all the people and all the interests? After a certain grade point is reached, then, by most discriminating and intelligent examinations, physical as well as mental, the children should be divided off according to their especial fitness, this one on to high school, and later to college and a profession, that one to manual training and a trade, and the other to the agricultural school and the farm. What is the use of leaving it to the fond parent, who may have dedicated to the ministry an infant who grows up better fitted by nature for a mule-driver? Oh, certainly! If papa wants to pay for it, let him educate his mule-driver into all the higher orgies of football, polo, poker, and so on, that he may get at the best universities, but I am writing now about the education supplied by the State, and for the maintenance of which we all subscribe.

What is the sense of one, or, at most, two, agricultural schools in a State and a high school in every cross-roads village? Our entire school system needs revamping. The State has mistakenly gone on in one direction. It is worse than folly to keep on because it started that way. It is most important that a change of direction be made, and the time to do it is now.

F. W. FITZPATRICK.

Washington, D. C., August 5.

BEASTS AND THE LAW.

TO THE EDITOR OF THE NATION:

SIR: In the various communications that you have printed concerning the legal trial of animals I have not noticed any reference to what is surely the *locus classicus* on the subject, "The Wasps" of Aristophanes. Philocleon, gone litigation-mad after having been long restrained from the courts by his devoted son, is at last allowed to amuse himself by trying a dog accused of stealing a piece of cheese. The cause is pleaded, testimony is brought forward, the innocent babes of the accused are produced to work upon the judicial sympathies, and the culprit is finally acquitted by mistake in a whirlwind of Aristophanic gayety.

Racine, in "Les Plaideurs," has imitated the scene closely, with somewhat more of the "gravity of mirth," but also with original touches of graceful pleasantry, as in the advocate's plea for the forlorn infants:

Venez, famille désolée;
Venez, pauvres enfants qu'on veut rendre orphelins,
Venez faire parler vos esprits enfantins.
Oui, messieurs, vous voyez ici notre misère:
Nous sommes orphelins, rendez-nous notre père, &c.

GAMALIEL BRADFORD, JR.

Wellesley Hills, Mass., August 13.

BY MEANS OF THE ACROSTIC.

TO THE EDITOR OF THE NATION:

SIR: I find that by applying Mr. W. S. Booth's acrostic theory to the Sonnets Isaac Newton can be credited with ix, xii, xv, and xviii, and Robert Browning with xxviii; while Theodore Roosevelt can claim xxxi, and George Gordon (Lord Byron) cx. This is a little confusing but is easily explained by the reincarnation of the omniscient Bacon who foresaw the personalities he would assume. I have no books since the fire and little time to devote to discovering how much of all literature is attributable to this Buddha.

There is a letter extant written by Bacon to Sir Richard Twomley in which he says that he is revising his works for publication, and has "the assistance of the best pens in London." The date of the letter identifies these "best pens" as Shakespeare, Marlowe, and Johnson, who were at that time constant callers at Bacon's house. Considering the adulation that was offered to patrons in that day there seems nothing extraordinary in these writers rather enjoying the exercise of weaving just such subtle flattery into their compositions.

ALEX. F. OAKEY.

San Francisco, Cal., August 5.

Notes.

Scribner's Magazine now announces that Mr. Roosevelt's account of his African trip will begin in the October issue, and will run for a year.

We are glad to hear that "Anne of Green Gables" is to have a sequel (published soon by L. C. Page & Co.), in "Anne of Avonlea." May she prove as charming as her original self.

"Stradella," another posthumous novel left by F. Marion Crawford, is to be published by the Macmillan Co. in the autumn. It is described as a love story of Italy of the seventeenth century.

Henry Holt & Co. hope to issue in September the third volume of DeAlva Stanwood Alexander's "Political History of the State of New York," which carries the narrative down to the time of Cleveland's first term.

Two more volumes of Scribners' New York edition of Henry James give us "The Golden Bowl," with a preface in the style of those contributed to the other stories. In the present case, Mr. James begins his prefatorial comment thus:

Among many matters thrown into relief by a refreshed acquaintance with "The Golden Bowl" what perhaps most stands out for me is the still marked inveteracy of a certain indirect and oblique view of my presented action: unless, indeed, I make up my mind to call this mode of treatment, on the contrary, any superficial appearance notwithstanding, the very straightest and closest possible.

There is no difficulty in comprehending what he means by an "indirect and oblique view" of the presented action; but those who wish to know what he regards as a possible alternative to this must turn to the preface itself. They will find here a discussion of literary method which is at least frank, if it is not simple. With these two volumes this handsomely made edition is complete.

There comes out of Tokio, clad in sea-green and gold, from the publishing house of Kyo-Bun-Kwan, a slender, graceful volume by J. Ingram Bryan, called "The Feeling for Nature in English Pastoral Poetry." Upon the outside of the cover is something vaguely Oriental in a Japanese vase. Inside, there are stars, honey, fire, dew, and flowers. This is not a treatise on pastoral poetry, gentle reader; it is itself a pastoral poem. Under the spell of the author's mellifluous, flowering prose, tropical to an almost Hibernian richness, the reader forgets, as the author forgot, all tedious details of chronology, typography, and orthography. Occasionally, indeed, one may feel some shade of difference of opinion from Mr. Bryan—for example, when he says that Bion and Moschus "remind one more of the grammarian than the poet." But again and again one finds one's self in heartiest accord with him. "It would be a mistake," he says, "to be hypercritically tempted into regarding the seventeenth century as a period in which there were no great poets." Perhaps one hesitates for a moment, but on thinking of Shakespeare and Jonson and Webster and Herrick and Milton and Dryden one must conclude that Mr. Bryan is right—is indubitably right. Again he speaks of Lyly's "poetic prose, admirable for smoothness and charm," and one thinks how aptly that characterization would fit the style of Carlyle or of Mr. Chesterton. "The calm and cultured atmosphere of Ben Jonson," he continues with another inimitable bit of generalization, "did not succeed in lending spontaneity to the lifeless classicism of Waller." Alas, how can we deny it—especially as we firmly believe that the full and fattened purse of William Wordsworth was equally unsuccessful in lending daffodils to the languid pantheism of Rockefeller? Those among us who knew what a feeling for nature is—and it is not the fault of literary investigators if any one is now in ignorance—will find in this volume much that is novel.

"The Literary Man's Bible," a selection of passages from the Old Testament, historic, poetic, and philosophic, arranged with introductory essays and annotations by W. L. Courtney, has appeared in a fourth and popular edition. The volume is intended to set before the reader the latest results of the higher criticism, and to attract attention to "the extraordinary literary value of the Bible." The prefatory essay accomplishes the first task very succinctly. The various strata of underlying text are described no less than the priestly redaction made during and after the Babylonian captivity. The editor is at pains to point out that some points in Jewish literary history grow rather more remarkable as the result of recent studies, as, for instance, that the Jews were so largely dominated by Babylonian influences and yet emerged with a set of legends monotheistic rather than polytheistic. Equally extraordinary was the intimate connection in the early nomad faith of the Hebrews between ethics and personal religion, to the comparative neglect of sacrifice and liturgical worship. It is questionable whether the second part of Courtney's task is equally successful. Imagine a parallel case. Suppose that Wolf's hypothesis of the Iliad had been broached among the Greeks of the decadence. Imagine the Ur-Iliad or the tale of a proto-Achilles torn from the conventional context and pieced by fragments allotted on alleged internal evidence (unverifiable by the average reader) to various subsequent periods and authors. The unity of the traditional design would be so broken as to dissipate much of the literary effectiveness of the tale. Something similar is experienced by reading the dissected portions of the Old Testament which are here arranged in an entirely novel order. The text of the King James version is very properly followed, though here the editor's literary feeling breaks away from his scientific leash.

In the preface to his "Historical Introduction to the Marprelate Tracts" (E. P. Dutton & Co.) Mr. William Pierce states that he has in mind to publish an edition of the Tracts themselves, with the necessary elucidations. Such a work we should welcome heartily. Meanwhile we can only commend Mr. Pierce for the diligent study shown in the present work, and regret his spirit. That spirit, at his best, can be shown in a brief quotation:

Early in his life Whitgift was swept by the tide of the Reformation into the Protestant camp; and there, so far as credal assent goes, he remained unchanged to the end. But Protestantism is more than an intellectual assent to a reformed creed:

it is the release of a new spirit; a buoyant and adventurous temper of the mind, a self-realization of the freedom and the prerogatives of the soul. And to the *ethos* of Protestantism Whitgift was entirely a stranger.

No objection will be taken, perhaps, to such a statement; but Mr. Pierce's summarizing of the conflict under Elizabeth so as to place all the freedom and prerogatives of the soul under the banner of nonconformity and only tyranny and the crooked counsels of hypocrisy on the side of the church ends by revolting the taste and judgment of any but the most bigoted reader. This is not to write history, but a brief for a criminal prosecution. The story of the tracts themselves, their authorship and obscure printing, Mr. Pierce has studied out with care, and his work is here valuable, although he has failed to put into his narrative the buoyant and adventurous interest of which it would be capable in a skilful hand.

Leopold von Ranke's "History of the Latin and Teutonic Nations" was published in 1824. It was the first important work of the author, who has justly been regarded with peculiar reverence as the founder of the modern scientific instruction in history. It was revised by him fifty years after its first appearance, but not with thoroughness or with suitable employment of later material. Its value to the student consists in its bringing together under one point of view the exceedingly complicated political and military events of a period in which the northern and the southern nations of Europe were engaged in working out the problem of control in Italy. It is not a work of the highest authority. The events it deals with have all been examined many times by more critical scholarship, but for the purpose for which it was designed, it still remains useful, and thanks are due to the translator, G. R. Dennis, and to the publishers, The Macmillan Co., for its present reproduction.

The most effective work now done in political science is that going on in the field of applied politics. Avoiding abstract principles and *a-priori* speculation, it addresses itself to examination of the actual organization of public authority and of the way in which governmental function is carried out. In "The Government of European Cities" (Macmillan), Prof. William Bennett Munro of Harvard has made a valuable addition to this literature. He gives a detailed account of the way in which municipal government is formed and carried on in France, Germany, and England. The style is clear, straightforward, and unpretentious, and the treatment is steadily confined to the subject in hand without any attempt to point a moral or aid a cause. At the same time references to American municipal methods frequently occur as incidents of the explanation of European procedure, and these add to the value of the book for American readers. The writing, while succinct, is copious in detail, and only administrative experts in the countries respectively considered could check off all the statements made; but the work itself affords intrinsic evidence of its painstaking accuracy. One cannot read the book without being deeply impressed by the essential simplicity of the principles upon which European municipal government is constituted. The general aspect of municipal government is far more democratic than in this country, and, in view of the contrast in results, the inference suggests itself that the road to improvement in American conditions lies in substituting simple forms for the present complex entanglements. The commission plan of government now fast sweeping throughout the country is a movement of this character, but it is accompanied by a restriction in extent of representation at wide variance with European practice, in which representative assemblies are so broadly constituted that every interest or locality is assured of a voice in the management of public affairs, although with no power to frustrate action prompted by consideration of general interests. Professor Munro's work has already been widely adopted as a text-book in university instruction, and extension of its use will be salutary.

Scientific history has put memoirs upon its Index—but that makes little difference to other people. Memoirs continue to appear and to prosper, like most things on the Index, even if they may be unreliable as records of the past and of value to the historian only when his documentary sources confirm the tale—or are lacking altogether. In this class belongs the "Recollections of Baron de Frénilly," which, with the Introduction and notes by Arthur Chuquet of the Institut, has been translated by Frederick Lees (Putnams). Frénilly, whose life stretched between 1768 and 1848, while not a conspicuous figure in the history of the Revolution, was acquainted with those who were. He was a typical product of the privileged class of the old régime, a young man-about-town with no other purpose in life than to shine in society. His Recollections, which were begun only in 1837, show a remarkably keen memory, particularly for small but picturesque details, but they are so deeply dyed in aristocratic prejudice that he would be a bold historian who would be willing to rest content with such a source for any incident which it recounts. The best of memories are sadly strained at the distance of forty years; here we have both strain and warp. The reader should be reminded that the Reign of Terror was but one incident in the French Revolution; there have been two other reigns of terror in Paris, worse from some points of view, of which we have relatively little literary record. Yet the human interest in those tragic days never flags. Frénilly just touched the fringe of the Terror, or else he has something to conceal—which seems quite probable. Perhaps the most interesting feature of the memoirs is the light they throw on the way the old noble families managed to save the wreck of their fortunes through the disorder of the time and in the face of confiscations. This is a page of French history, and of the history of property, awaiting more thorough research.

With the issue by Zanichelli of Bologna of the twentieth and final volume of the complete edition of Carducci's works, a number of critics have published estimates of different phases of his art. Benedetto Croce in a recent number of *La Critica* discusses the influence which foreign poets, and especially Heine, exerted upon Carducci, and ingeniously leads to the conclusion that their effect is wholly negligible. Adolfo Gandiglio's volume, "Studio su la Canzone di Legnano," deals carefully with the historical sources of that poem, while, as the title of the book indicates, "Il pensiero di Carlo Cattaneo e di Giuseppe Mazzini nelle poesie di G. Carducci," by Pietro Tommasini-Mattiuci, weighs the political and historical influences on his thought of the times in which he lived. Zanichelli proposes to begin at once, in uniform edition, the publication of Carducci's letters, and to complete this collection with a volume of hitherto unpublished writings. In addition to this more expensive edition, the publishers have begun to issue a reprint at seven cents a volume.

When once you have become attached or, as the case may be, reconciled to the floridness of his style, there are few pleasanter guides to Italy than Mr. Edward Hutton. His latest book, "In Unknown Tuscany" (Dutton), describes a summer passed on Monte Amiata. Most Italian travellers have at one time or another yearned toward the great blue dome that towers in southern Tuscany, and have vaguely asked themselves what it was like up there. Mr. Hutton answers that question. It is full of ruined feudal castles and dismantled monasteries. At Radicifoni and Santa Fiora are many fine enamelled reliefs of Giovanni della Robbia and his school. Everywhere there are magnificent views over the Maremma, the lakes of Trasimene and Bolsena, or towards the more distant Appenines of Umbria and the Marca. The peasants are simple, independent, and courteous. Intensely religious—in a single sector of the mountain Mr. Hutton counted fifty-four beacon fires on the evening of the feast of the Assumption—the region has within a generation produced a Messiah. The story of David Lazzaretti, who founded a theocratic republic only to fall before the bullets of the carbineer in 1877, is one of the most interesting parts of the book. People still speak of him on the mountain as *nostro Gesù*. Politically the history of the region is remarkable. All forms of lordship were represented. The Abbey of San Salvatore ruled a large part of the heights. From Santa Fiora the Aldobrandeschi played a sharp though losing game with the Emperor, the Pope, and the Commune of Siena. Small tyrants, *signorotti*, kept alive here the traditions of feudalism long after it had vanished from northern Tuscany. Among these little lords was the famous robber Chino di Tacco, whom Dante and Boccaccio have immortalized. On the other hand the town of San Salvatore obtained a substantial bill of rights from its abbot lord in 1212, three years before the English Barons met at Runnymede. Mr. William Heywood contributes scholarly notes on all such matters. It is evident that the fuller study of this neglected region might cast much light on the winning of communal independence in Italy. Naturally Mr. Hutton's business is with his own impressions of the people and scenery—on which topics he is characteristically lyrical—and with the historical narrative, which enlists his more sober manner. The blend if not quite harmonious is agreeable enough. As to practical ways

and means, the unexigent Anglo-Saxon may find good permanent accommodation at Abbadia S. Salvatore, whence on donkey back the rest of the mountain may be explored. The book contains numerous photographic cuts and eight color prints after sketches by O. F. M. Ward. These are alluring to the intending traveller if rather faintly pretty as transcribed in colored inks.

Volumes XIII, XIV, and XV of Worthington C. Ford's edition of the "Journals of the Continental Congress" (Government Printing Office), aggregating more than 1,400 pages of text, are needed for the record of 1779. The new matter is greater in amount than for any previous year, more than half of the record of proceedings being now for the first time printed; while, in addition, numerous reports of committees and boards, and the entries of the "Secret Journals," are inserted. The year was crowded with business and anxiety. January opened with the summary dismissal of Thomas Paine from the secretaryship of the Committee for Foreign Affairs, following his blazing indiscretion, for which he seems to have felt no remorse, in revealing diplomatic secrets. An investigation of the conduct of the American representatives in Europe, though disastrous to the reputation of more than one actor, both at home and abroad, was followed by the abandonment of the plan of one commission of several members, and the appointment of ministers plenipotentiary to Great Britain, France, Spain, and Holland. Much time was also spent in discussing the terms of the anticipated peace, the most troublesome matters being those of boundary, fishing rights, and the navigation of the Mississippi. On the other hand, the supreme value of the French connection is never lost sight of, Congress adopting, as early as January 14, the fateful resolution not to make peace alone. The plan for a renewed attack on Canada, which had haunted Congress ever since the failure of Arnold and Montgomery, was finally given up. Commendable progress was made in the direction of a better administrative organization. An inspector-general's department, an ordnance department, and a board of admiralty were provided for, the former Treasury system was replaced by a Treasury board, and persons not members of Congress were brought into the administrative service. Of the admiralty powers of Congress, there was frequent consideration.

On the other hand, State controversies and personal bickerings were rife, and the financial situation was moving rapidly from bad to worse. Pennsylvania preferred charges against Arnold, which had not been disposed of by the end of the year; the people of the New Hampshire Grants complained of the encroachments of New York, New Hampshire, and Massachusetts; Rhode Island was suffering from the effects of an embargo on the export of provisions from Connecticut and Massachusetts; and there was outspoken opposition in Maryland and elsewhere to the course of Virginia in the matter of its Western lands. A step in the direction of sounder finance was taken in September, in limiting to $200,000,000 the total issues of bills of credit; and November 29 saw the last output of this demoralizing form of currency. Requisitions continued to be made upon the States, as in the previous year, for money and specific supplies; while in September the situation was so bad that an address to the country was issued, in which Congress pathetically urged the folly of pledging the faith of the United States for the payment of a national debt, unless the States raised promptly and fully the sums apportioned to them. The only really bright spot of the year, outside of the reorganization of the diplomatic and administrative services, was the adoption of Steuben's admirable infantry regulations, and the increased disposition to rely, in military matters, upon the judgment of Washington. Of the excellence of Mr. Ford's editing we can only repeat what has already been more than once said in our notices of the earlier volumes of this invaluable series.

Dr. Johannes Luther's "Die Titeleinfassungen der Reformationszeit," soon to be published by Rudolf Haupt of Leipzig, the publisher of the publications of the Gesellschaft für Typenkunde des XV Jahrhunderts, will be an important source for the study, not only of the typography and engraving, but of the literature and civilization of the early sixteenth century. In these borders we find numerous illustrations of costumes, processions, plays, etc., of the time. The work will be published in six or eight parts, each containing fifty plates, and for each plate a transparent duplicate.

Everybody interested in the mediæval "Dance of Death" must have felt the lack of a handy treatise on the subject. The publications treating the same are almost all too costly, or out of print. This want is now filled by the work of Prof. Joseph Künstle of Freiburg im Breisgau, entitled "Die Legende von den drei Lebenden und den drei Toten nebst einem Exkurs über die Jakobuslegende" (Freiburg i. Br.; and St. Louis, Mo., Herder). This volume supersedes all former publications, being based on the results afforded by the most recent research. Professor Künstle brings sufficient evidence to prove that the Dance of Death is the direct outcome of the thirteenth-century legends of the "three living and three dead." This is a new thesis, and it enables the author to elucidate the development of the legend and of its representations in art from the twelfth to the fifteenth century. Like so many other subjects of mediæval iconography, this was suppressed by the Tridentine Council. The author presents all the texts necessary to the understanding of the subject, and among these a Lübeck manuscript containing a low German dialogue between a dead man and a living one, with highly interesting drawings dating from the fourteenth century. The introductory chapter on the representations of the legends of St. James the Greater in German art is an admirable essay on iconography. This saint was specially popular in the Middle Ages in southern Germany, where many confraternities and chapels were dedicated to him. Recently several of the latter have been freed from the whitewash concealing the frescoes on the walls, and important representations of the legends connected with the saint of Compostella have been thus discovered.

Benjamin Ellis Martin died August 15 in this city, where he was born seventy years ago. He spent his life writing and travelling, and his best-known books are "About England with Dickens," "Old Chelsea," "In the Footprints of Charles Lamb," and "The Stones of Paris in History and Letters."

Prof. Wilhelm Bernhardt of Washington was killed on Thursday of last week at Burlington, Vt., by a train on the Rutland Railroad. He was deaf, and it is supposed that he failed to hear the approaching train. He was born in Halle, Thuringia, about sixty years ago, and came to this country after the Franco-Prussian war. He taught in various places, and served as director of German in the high schools of Washington from 1882 to 1896; and was the author of a German grammar, a history of German literature, besides editing editions of many German authors.

The Rev. Hiram Washington Thomas, founder of the People's Church of Chicago, has died at the age of seventy-seven. In 1881 Dr. Thomas was expelled from the Methodist Episcopal Church for heresy. He is the author of "Origin and Destiny of Man," "Life and Sermons," and "The People's Pulpit."

DANTE IN ENGLAND.

Dante in English Literature from Chaucer to Cary. By Paget Toynbee. New York: The Macmillan Co. 2 vols. $5.

To collect the available references to Dante in English literature from Chaucer to Cary is indeed a Herculean task; and Dr. Toynbee is to be warmly congratulated upon his extensive performance. His sane and thorough scholarship, which has long been known to English and foreign lovers of Dante, now demands recognition from students of English literature. This is, to be sure, a book of reference rather than a critical work. But the quotations from the five or six hundred authors are so clearly and so admirably arranged that it is not difficult to trace the history of Dante's fame in England.

An introductory essay sums up the conclusions of the research. It is a difficult task to cover so wide a topic in so few pages; and, although the principal facts are clearly and soundly set forth, the essay lacks distinction in style and seems not to have accounted sufficiently for the various streams and tendencies in literature that have caused fluctuations in Dante's fame. Nor has Dr. Toynbee thrown any new light on some of the perplexing problems in this field of criticism. He gives no satisfactory explanation of the curious reference to Chaucer in Lydgate:

> He wrote also full many aday agone
> Daunt in Engiysch hym selfe so doth expresse.

The treatment of the influence of Dante upon Lindsay's "Dreme" is disappointing; nor is there any mention of the same author's "Exclamatioun to the Reader twycheyng the wrytting of Vulgare and Maternall Language," which may have relation with the "Convivio" and the "De Vulgari Eloquentia." In the case of Dunbar, too, as in that

of Lindsay and the other Scottish poets, the problem of Italian influence needs further investigation. On all questions of the possible influence of Dante, Dr. Toynbee happily sins on the side of caution. In discussing Sackville's Induction, for example, he quotes Professor Courthope's contention that Sackville's sources were Virgil and Gavin Douglas, and adds, "But this does not preclude the suggestion that Sackville was influenced by Dante as well." It is, by the way, strange to see so excellent a scholar make the old mistake of assigning the plan of the poem on the model of Lydgate's "Falls of Princes" to Sackville, who, it is now well known, was merely a contributor to the work. Dr. Toynbee's words on the relations between Spenser and Dante are somewhat disappointing. Doubtless it is a "much debated question which it seems impossible definitely to decide"; but the personal opinion of such a Dante scholar as the author would satisfy us more than his Scotch verdict of not proven. Such problems cannot, of course, be settled by parallel passages alone; it is decidedly refreshing to see an enthusiastic follower of a great poet refrain from assigning to his influence similar ideas in later writers. But there are other literary tests that might be applied.

At the close of his preface the author asks for "information which may serve to fill the inevitable gaps in this first instalment of the history of Dante in English literature." The first instalment is so elaborate and so large that additions of any moment cannot be extensive, yet one or two references of minor importance it may not be amiss to give here. One interesting reference in Milton is omitted. In a letter to his friend, Deodati, written from London, April 21, 1647, the English poet bespeaks for his own religious views from the Italians the same indulgence which they showed to Alighieri and Petrarch. Under Thomas Fuller should be added a translation of Leland's epigram on Sir Thomas Wyatt, which Dr. Toynbee prints under Anthony Wood, but which was also published in Fuller's "Worthies of England," 1662. It is also interesting to note that in the 1641 edition of Foxe's "Martyrs" there appears in the index: "Dante an Italian writer against the Pope." Dr. Toynbee is doubtless right in excluding what may be mere suggestions of the influence of Dante, as, for example, the relations between the "Vita Nuova" and the "Memoirs" of Sir Kenelm Digby. It may, however, be permissible to quote here what Professor Norton, in an unpublished letter, writes of Dante and Donne:

> I have the impression that there are one or two references to him in Donne's sermons, but possibly I am deceived by the memory of passages analogous in thought or statement of doctrine. I have not the volumes here to refer to and make sure. At any rate, for richness of learning, abundance of thought, and depth of feeling Donne's are better worth reading than any other sermons of the time.

To Americans it must seem strange that there is no allusion in these volumes to the influence of Dante upon American writers. To be sure, not much more than a beginning had been made before 1844, the *terminus ad quem* of Dr. Toynbee's work. But the first ten cantos of the Inferno were translated by T. W. Parsons in 1843; and his distinguished lines "On a bust of Dante" are no mean contribution to English poetry. Of course, the notes to Longfellow's translation, which are perhaps the most important contribution made by America to the literary study of Dante, do not come within the limits of this work. But Longfellow had begun his study of Dante much earlier than 1844. In his inaugural address as professor of modern languages in Bowdoin College, delivered in 1830, he speaks of Dante as the immortal Father of Italian song, and adds:

> Throughout the Divina Commedia of Dante it is easy to trace the workings of the political and religious character of his age. Whether he leads you to the peaceful shades of Paradise or enters that broad gate over which is inscribed, "Through me ye pass into the city of woe," it is but a transcript of the stirring thoughts which agitated not only his own bosom, but the bosoms of the crowd around him, of his paternal city, of his native province, of all Italy.

It is interesting to set such a passage over against Mrs. Trollope's words written in 1832, labelled by the editor, "American ignorance of Italian literature":

> To speak of Chaucer, or even Spenser, as a modern appears to the Americans inexpressibly ridiculous; and all the rich and varied eloquence of Italy, from Dante to Monti, is about as much known to them as the Welsh effusions of Urien and Mordred to us.

Doubtless the influence of Dante upon American letters was not marked until the work of Longfellow and Lowell and Norton had been published; but early allusions cannot be altogether lacking. Perhaps Dr. Toynbee has intended his work to be limited strictly to the British Isles.

In glancing over the chronological list of authors published at the end of the second volume, one is struck by the quality of the men in English literature who have had the most to do with Dante. When we read the names of Chaucer, Milton, Gray, Shelley, and Keats, and of Sir Thomas Browne, Coleridge ,and Ruskin, we are reminded anew of the criticism that Dante compels attention from certain types of mind, and that the true appreciation of him is one of the touchstones of literary taste. But it is not chiefly in gathering the tributes of such great souls as these that Dr. Toynbee has made his work of value: it is in the countless allusions to Dante from the lesser men that we may see more clearly the progress of the Italian's power in English literature. In some respects the editor has focussed the light on some interesting literary problems. The relations between Gray and Cary, on the one hand, and Lamb and Cary on the other, are set forth most suggestively. Cary, by the way, is becoming more and more an important figure in our poetry. This fact is due in part to the time in which he wrote and in part to the fact that he has written what Professor Grandgent, in his interesting introduction to his lately published Inferno, calls, of the numerous English versions, "the easiest to read." Dr. Toynbee writes: "Cary once and for all made Dante an English possession, and in so doing won for Dante, as well as for himself, a permanent place in English literature." Dr. Toynbee also has valuable comments upon the work of expatriated Italians in England, such as Baretti and Fuseli, who, long before the time of the Rossettis, helped to spread Italian influence upon English poetry and prose and to extend the knowledge of Dante. Notable, too, are the comments of the editor upon Coleridge's lecture upon Dante, and the impetus it gave not only to the sales of Cary's version, but to the study of the poet in England.

Although Dr. Toynbee's work will naturally appeal more to the scholar and the student, many parts of it will not fail to arouse the interest of the general reader. It is no unlively literary adventure to wander through its pages and to see the quaint comments made upon Dante and Italian literature in the various centuries. Nor are all the early comments merely curious. Was Milton, for example, responsible for the interpretation of the Divine Comedy that led his nephew, Edward Phillips, to speak of it as the Paradise to which are added the Purgatory and the Inferno? What must have been the conflicts of emotion in Thomas Warton which led him to speak of Dante's "Gothic and extravagant innovations," and yet to allow that his "grossest improprieties discover an originality of invention, and that his absurdities often border on sublimity"? It is odd to read of Miss Anna Seward's attempts to recommend Dante to Scott, and of his answer that the plan of the Divine Comedy appeared to him unhappy, and that the personal malignity and the strange mode of revenge were presumptuous and uninteresting. Then there is the anecdote of Norton Nicholls, a freshman at Cambridge, drinking tea with Gray and winning that poet's encouraging affability by quoting a verse from Dante. And there are the curious judgments of Landor who at one time called

the Inferno, "the most immoral and impious book that ever was written," and who also pronounced thirty lines of the Ugolino episode to be "unequalled by any other continuous thirty lines in the whole dominions of poetry." Not many would be likely to think of Fanny Kemble as a life-long admirer of Dante; nor to remember that Arthur Hallam rendered into verse most of the sonnets of the "Vita Nuova." Gladstone wrote that Hallam often complained that "Dante was not properly appreciated even by his admirers, who dwell only on his glowing power and sublimity, without adverting to the peculiar sweetness and tenderness which characterize, as he thought, so much of his poetry."

Many such criticisms may be found in Dr. Toynbee's work; and we advise the general reader to go exploring for himself. He must have read little, indeed, of English literature if he will not here find something to his purpose. And if he is also a lover of Dante, he will be glad to pay tribute again to the industry, zeal, and breadth of scholarship of Dr. Toynbee.

CURRENT FICTION.

A Certain Rich Man. By William Allen White. New York: The Macmillan Co.

Here is a full-bodied novel of the Middle West written in the generous, leisurely, ruminative style of the early Victorians. It is obvious that the author has listened with interest to the yearning prophecies of *The* American Novel, and that he has attempted to end them by fulfilling them. Considering the magnitude of his undertaking, his success has been remarkable. He has set forth from boyhood to death the career of John Barclay, a representative American multi-millionaire and captain of industry. In portraying the life of Barclay he has written the history of the growth of a typical Kansas city during a period of fifty years. The actual field of the fiction may appear at first thought somewhat provincial; but Mr. White has shown a surprising power of relating his Sycamore Ridge to the national past, present, and future, and of making it mirror in some sort the developing character of the entire country.

The curtain rises on a struggling frontier town shortly before the beginning of the civil war. The conflict calls every competent pioneer into the ranks. The recruits from Sycamore Ridge are a faithfully composite lot—a tuneful Scotch harness-maker, a German, a sharp-tongued Irishman, a magniloquent Southerner, a passionate young abolitionist from New England, a quondam horsethief, and, as runaways caught by the tide of patriotism, barefoot, eleven-year-old Johnnie Barclay and his chum. No one knows better than Mr. White what real boys say and do in every conceivable circumstance, and the first half-dozen chapters of his book dealing with the early years of his hero are, though splashed with blood, purely delightful. After the war the patriots, never utterly losing the vestiges of their soldierly consecration, fade away into matrimony, law, real-estate, wheat-raising, and railroading. Johnnie Barclay, at first a dreamy, imaginative youth fond of Emerson and music, develops shrewdness, acquires hardness, exhibits a bent for trading, gets the loose ends of local business into his hands, and, finally, stride by stride upon the necks of his fellow townsmen, emerges into the great financial world.

Though the material which has been crammed into this novel is enormous, it is not without a certain large unity. The hero of the story is indeed rather Sycamore Ridge making itself a city out of the barbarous West, rather the gradually awakening conscience of the nation, troubled by magnificent crimes unregarded by the law, than John Barclay piling up his unscrupulous millions. And yet the character of the self-made Crœsus, his manners, his morals, his might, are seen to be implicated coarsely or subtly in the destinies of all whom he touches, in the inmost fibres, in fact, of his town, of his State, of the whole commonwealth. Nevertheless, the reader feels a loosening grip, a scattering of the interest in the latter part of the narrative. It was manifestly a difficult novel to terminate. Toward the end, the courts indict the rich man—the flavor here becomes strongly contemporaneous—but he slips through their fingers. Mr. White, feeling that this will never do, yet uninstructed by example, subjects Mr. Barclay to a kind of Christian conversion or change of heart, under the influence of which he buys up all the stock in his Trust, burns his certificates, and dies in the performance of an insignificant act of self-sacrifice. Aside from this over-moralized conclusion, there is small complaint to make on the score of realism. The aim of Mr. White, however, is far removed from the strident veracity of the alarmist and muckraker. He tells the truth unwinkingly, but with the reassuring poise and geniality of those who in the most dubious times believe in a slowly-bettering world.

Norah Conough. By Walter George Henderson. New York: The Outing Publishing Co.

The map of British colonial fiction is being steadily filled in. Remote back districts are dotted with the red of romance, and every port hath its minor Kipling. To an American the interesting thing about all this mass of story-telling is its solidarity, its wonderful, if familiar, coherence. We hear much of the growing independence of the colonies, of their radical innovations upon the insular way of doing things, of their laudable similarity to ourselves. The fact remains of their mutual bond; and the visible sign of it—an obstinate fidelity to the home code of social formalities—is as striking as ever. Socially, it seems, every Colonial remains an exiled Englander. The rude conditions of military or pioneer service, the exotic scene, merely afford a quaint setting for the familiar action. Norah Conough is the dear girl of English story transferred, but not translated, to the comparatively fresh literary soil of New South Wales. She and Donald Southerden, whose name sufficiently defines him, have neighboring "selections" in a half-settled bullock-country. There is a new local technology for us to puzzle over, and a back scene in which cattle-fences, creeks, and gum-trees take the place of the English hedges, lanes, and parks, in which most of the action might as well have taken place. Theresa, the inn-keeper's daughter, and her rough champion are the figures which give the pleasant story such distinctiveness as it can lay claim to.

Brothers All. By Maarten Maartens. New York: D. Appleton & Co.

This collection of short stories by "Maarten Maartens" differs little from its predecessors—unless, perhaps, as it makes smaller display of his versatility, and over-represents a type of humorous tale in which he does not excel. A Dutchman who is influenced by diverse French and English models, and who writes in English chiefly upon Dutch themes, labors under evident disadvantages. This writer has always shown a good deal of cleverness, especially in his stories after the French manner. It is as well for him, probably, that he has not chosen French as his medium; there, we suspect, what has seemed Gallic finesse would prove to be mere Teutonic adroitness. Comparatively few of his stories seem to have come into being through any other method than deliberate manufacture. Admiration of his processes, of the skill with which he shapes his product to conform to the given model, and achieves the desired finish, is, after all, a doubtful tribute. He is never so little successful as in his studies in the comic vein. Dutch peasant life offers plenty of material in this kind, but he is unable to make use of it; he cannot create an Ichabod Crane or a Mrs. Poyser. Half-a-dozen of the present stories are mere bits of facetiousness. The story-teller is at his best in those simpler and soberer sketches of Dutch character and manners which constitute his real gift to the literature of the day. "The Death-Way" and "The Promise," with their grimly tender insight and sympathy, represent a sincere and fruitful native humor. Even in these tales—

though less noticeably than elsewhere—the effect is confused somewhat by the writer's attempt to translate the speech of the Dutch peasant or burgher into English vernacular terms. When a dying man says, "Something's gone in my innards: I've a-felt it going. The farm's very small and poor, but I done my best," we find it hard to realize that a farmer of Holland is supposed to be the speaker. He seems merely to be using bad English of no particular habitat.

Gambolling with Galatea. By Curtis Dunham. With illustrations by Oliver Herford. Boston: Houghton Mifflin Co.

It would be interesting to know what Mr. Herford, to whom has fallen the task of bepicturing this extravaganza, really thinks of its quality. Mr. Herford's own sense of humor, though not always the extreme of fastidiousness, is lively and discriminating. Did this "bucolic romance" really seem to him entertaining, or did he simply make the best of it, choose a passage here and there which seemed to invite a fantastic pencil, and forget the whole affair as quickly as possible? The tale belongs roughly to the Bangs school. The heroine is named Galatea, and one of the other persons is a pig, who exquisitely becomes Pig-malion for a whole chapter, and has his portrait taken in Galatea's lingerie hat. This may be taken as a fair sample of the sprightly episodes which make up the narrative. The tediousness of the performance is aggravated by the "literary" affectation of its style.

THE FAITH OF ISLAM.

The Religious Attitude and Life in Islam [Haskell Lectures]. By Duncan Black Macdonald. Chicago: University of Chicago Press. $1.75 net.

In a former volume, on "Muslim Theology, Jurisprudence, and Constitutional Theory," Professor Macdonald has discussed Moslem theological dogma, including such points as the being and attributes of deity, human freedom, and the question whether the Koran was created or uncreated; in the present volume, he describes the ideas of the Moslems respecting intercourse with the unseen world—as his thesis, he takes Professor William James's definition of religion, that it is the belief in an unseen order. In the life of the Moslem [Macdonald says the "Oriental," but the term is too broad], with his lack of the sense of law, the unseen plays a great part; our author's object is to describe the methods by which relations with the supernatural are maintained through prophets, diviners, magic, jinn, dreams, and saints. In all these cases there is divine revelation. Prophets, Hebrew and Arabian, spoke by compulsion from without, and commonly their utterances were in poetical form. In connection with this fact there is a question of some interest. Macdonald, here following Goldziher, observes that there is no distinctive word in Hebrew for "poet," and the common Arabic word for "poet" means "he who knows"; there is also a Hebrew term for "diviner" with the same meaning. Goldziher concludes that for the Arabs poetry was magical utterance, and the poet in part a magician and soothsayer. It is doubtful, however, whether this is the proper statement of the Old-Semitic conception of the relation between poetry and magic. The authors of the great pre-Mohammedan Arabian poems speak out of their own minds, with no hint of supernatural influence, and there is no trace of the relation in question in the Babylonian and Hebrew literatures. The better statement would seem to be that, according to Semitic ideas, all remarkable deeds and utterances came through supernatural influence; seers, soothsayers, and prophets spoke under a divine seizure, and as their words, by a natural human instinct, fell into rhythmical form, this form came to be associated with soothsayers who, in old times, were the principal speakers of the community, and in Arabic the "knower" came to be the term for poet. Poetry was the natural form of speech of the inspired man; it was not that the poet was a soothsayer, but that the soothsayer was a poet.

This, however, is an incidental point so far as regards the main object of Professor Macdonald's volume. He has collected a large mass of material illustrating Moslem opinions concerning the messages brought to men from the other world in sleep and by jinn. For a full history of the jinn our data are regrettably meagre; Robertson Smith's definition of them as "gods without worshippers" hardly does justice to the known facts; they are the spirits of early times, good and bad. Even in Mohammed's day there were believing jinn, and later these came to play a great rôle; they formed marriage alliances with human beings, and became the teachers and the pupils of saints. As for the Moslem belief in dreams, it was and is substantially the same as that which has been and is now not uncommon in the Christian world.

An excellent feature of this volume is the exposition it gives of the Moslem philosophical explanations of the phenomena of prophecy and dreams; particularly Ibn Khaldun is cited at great length. This philosopher, it is true, is unique in the Moslem world—almost modern, as Macdonald says, in the scientific character of his thought; he was late (*ca.* 1400 A. D.), and he was much influenced by Greek philosophy. Still we may suppose that he represents advanced Moslem opinion to a certain extent, and, in any case, his views have interest for modern psychologists. His point is that the soul is potentially a spiritual essence, ordinarily restrained by the body, through which it works; but it is possible that it may become free from the trammels of the bodily senses, in which case it will attain to the apprehension of reality and to the vision of the future. Such an emancipation may take place in sleep, when the eyes of the rational soul are open. In idiots and insane persons also the ordinary capacities of the mind are obscured or effaced, and the soul is in fit condition to enter into relation with the spiritual powers of the world. Men differ in their aptitude for spiritual illumination; the most gifted persons in this regard are prophets, to whom the essence of truth and the secrets of the future are revealed by God. Various other classes of persons are discussed by Ibn Khaldun, such as astrologers, wizards, diviners, and his system embraces practically all occult phenomena. Comparisons with the methods of Christian science and the phenomena of hypnotism naturally suggest themselves, and are made by Macdonald; can Mohammed's experience have been a case of auto-hypnotism?

The ascetic life, with its mystical experiences, has been developed to an extraordinary extent by the Moslems, and Professor Macdonald devotes much space to the famous mystic Al-Ghazzali, quoting largely from his works, especially from his remarkable autobiography (*ca.* 1100 A. D.). Al-Ghazzali, in his search for certainty, had fallen into complete skepticism. He found that his senses deceived him, and concluded that his reason was no more trustworthy than they. From this disease God healed him by a light cast into his breast, and he proceeded to examine the systems of the scholastic theologians, the allegorists, the philosophers and the sufis. It was only in the last of these that he found satisfaction, and, after passing through a variety of experiences, he withdrew wholly from the world and gave himself up to meditation. At last he found peace by excluding all earthly things and immersing himself in the thought of God. Reasoning and speculation he cast away, and sought to be conscious of nothing but God. The man's seriousness and modesty make him an attractive figure, and he became a force in and beyond Islam.

We are indebted to Professor Macdonald for a valuable exposition of one phase of Moslem thought, and we would suggest that the value of his work would be increased by distinguishing between the three sections of Islam, the Semitic, the Aryan, and the Berber. It is only the Aryan that has developed mysticism.

Sir George Mackenzie, King's Advocate, of Rosehaugh: His Life and Times. By Andrew Lang. New York: Longmans, Green, & Co. $4.20 net.

The names usually associated with the royalist side of the dramatic struggle of Restoration times in Scotland are those of Monmouth, Lauderdale, Claverhouse, and Sharp, soldiers, statesmen, or churchmen. The name of Sir George Mackenzie of Rosehaugh, who as King's Advocate from 1677 to 1686, and again in 1688-9, had principal charge of the government prosecutions, scarcely appears at all in the ordinary books, and, when it does, is almost invariably coupled with the invidious epithet "The Bloody." Sir Walter Scott, who did more to mould the popular conception of Scottish history than any other writer, mentions him several times in the Waverley Novels, almost invariably in terms of disparagement; the Dictionary of National Biography, "the modern Book of Doom," as Mr. Lang calls it, declares that the "one redeeming feature" of Mackenzie was his love of literature; so strong, indeed, is the prevailing tendency to attribute to him every single legal iniquity of the age in which he lived, that so eminent an historian as P. Hume Brown has been led into the grave error of assigning to him the rôle of government prosecutor of the rebels of the Pentland Rising, in 1666, and of intimating that he was responsible for the detestable torturing of Hugh Mackail, whereas in reality he was counsel for the defence, and did all in his power, at that stage of his career, to mitigate the severity of the punishment of the Covenanters. A truer picture of the great King's Advocate was given by John Willcock, whose life of the Earl of Argyll appeared in 1907, and who there lamented the fact that, though several zealous attempts had been made to represent the ruthless Claverhouse as a hero, Sir George Mackenzie still lacked a defender. Possibly it may have been at Mr. Willcock's suggestion that Mr. Lang took up the task. Whatever the cause of its inception, his book is, like all his other works, deeply interesting; it adds much to our knowledge of the life of its subject, and it presents him in a far more favorable light than ever before.

The importance of Mackenzie's career as King's Advocate has caused many writers to forget that during the greater part of his life he was a friend and defender of the Covenanters. His prosecution of the Earl of Argyll in 1685 has overshadowed the fact that he won his first great legal reputation by his brilliant, though unsuccessful, defence of that Earl's father in 1661. The key to his whole career is to be found in the reasons that impelled him to change sides, and accept the post of King's Advocate in 1677. Briefly stated, if we omit his personal hatred of Lockhart, those reasons may be described as a firm conviction that the maintenance of order by persecution was preferable to anarchy and civil war. "Resistance in the name of civil and religious liberty was now going 'beyond his first inclination,' and he sided with the government, as a Radical, in face of Socialism, may become a Tory." From that time onward his main tenet was that personal belief should be suppressed or dissembled at the bidding of authority, and that the state was at liberty to compel outward conformity to certain things, not because they were true, but because they had been commanded. Thus the man whose *bon naturel* shrank from harsh measures allowed himself to be converted into a persecutor.

Such is Mr. Lang's argument; and there is certainly much to be said for his side of the case. Whatever the final verdict of history about Mackenzie may be, it is clear that he deserves to be far better known than he has hitherto been. He is an infinitely more interesting person than Lauderdale; in some respects he is abreast of his more showy contemporary, Claverhouse. As a lawyer he was in the very first rank; as a writer of prose and poetry, prolific and able. A rather melancholy interest attaches to his final withdrawal, on the arrival of "Dutch William" and a régime in which he preferred to find no place, for study and seclusion to Oxford, "that dear city of youth and dream"; and the picture stands out the sharper by contrast with the dramatic ending of Dundee's career at the pass of Killiecrankie.

Social Organization: A Study of the Larger Mind. By Charles Horton Cooley. New York: Charles Scribner's Sons. $1.50 net.

This is a notable book, full of discriminating insight and freighted with well-canvassed and hopeful forecasts for democracy. The title sounds a bit mystifying, and might with advantage be replaced by the less ambiguous phrase—a study of public opinion. For by "social organization" Mr. Cooley means essentially this: an analysis of public opinion; its genesis, nature, and functions, not only in the fleeting present, but in its more durable manifestations, such as its dominant ideals, its stratification in social classes, its methods of intercommunication, its institutions, and its corporate activities. The book goes far to reconcile one to the claim that there is a special sociological point of view, if one so chooses to call the attempt to scan society in its *tout ensemble* rather than from the narrower special standpoint of narrative history, economics, or politics. Except that he limits his analysis to material psychological in essence, to the conscious though purely provisional exclusion of the physical environment, his book is what an Aristotelian would call politics. It is much as though Mr. Bryce had written a work on the American Common-Mind, rather than on the American Commonwealth. It exemplifies also a refreshing absence of the hysteria with which the professional worshippers of the sociological Baal leap upon the altar and cry aloud and cut themselves after their manner, though they succeed in evoking "no voice, nor any to answer, nor any that regardeth."

The single pertinent criticism to be passed on this work is what we deem its ill-founded assimilation of the social consciousness to what we know as self-consciousness The truth or falsity of this identification in nowise impairs the ripe wisdom that everywhere illuminates the discussion of concrete phases of public opinion. But the notion itself is so little substantiated that its discrediting is worth while. "Mind," says Mr. Cooley at the outset (p 3), "is an organic whole made up of coöperating individualities in somewhat the same way that the music of an orchestra is made up of divergent but related sounds." "Self and society are twin-born . . . and the notion of a separate and independent ego is an illusion" (p. 5). "I am aware of the social group in which I live as immediately and authentically as I am aware of myself" (p 9) The "coöperative activity" of individuals "gives us public consciousness, or, to use a more familiar term, public opinion, in the broad sense of a group state of mind which is more or less distinctly aware of itself" (p. 10).

At the peril of aligning ourselves with the benighted followers of common-sense, we feel disposed to deny these assertions *in toto*. Making every allowance for the way one mind is colored by its contact with another, as well as for the comparatively late emergence in child psychology of the "I-concept," the idea that even the most extreme mutual sympathy creates a corporate consciousness like in kind to individual self-consciousness can only be set down as an illusion. The golden thread of persisting self-identity which threads the beads of individual psychical experiences must be absent on the larger social scale. Dissent to Mr. Cooley's view from a slightly different angle is admirably put by Henry Rutgers Marshall in his "Instinct and Reason," where he first shows how the alleged social organism, if it exists at all, is akin to the lowest cell-complexes which are aggregated together instead of integrated. He then pertinently concludes that it is improper to speak of "the opinions of aggregates of men" . . . as a "social consciousness" . . . "for the conception of a social consciousness implies that the thoughts of men as they are related to the whole pulse of the social consciousness, must correspond in the main with

particular psychic elements in us, as these are related to the whole purse of our own conscious life" ("Instinct and Reason," p. 189).

As remarked above, the cardinal error does not infect the substance of the analysis which follows. This analysis is wholly admirable. It is as though Lincoln, with his range of insight and experience, had superadded the culture of the schools, and were calmly pointing out in his exposé of public opinion the moral legitimacy of democracy. Illustrative of the originality of the author is his calm reargument and rebuttal of the hasty conclusion that group opinion is commonly below the average of intelligence in the group (p. 123 *sq*). Typical of his ripeness and sanity in matters of practical concern is his adverse verdict upon the general efficacy of "the referendum and similar devices for increased participation of the people at large in the details of legislation" (p. 129). Rare discrimination is shown, for example, in the subtle inquiry whether democracy is hostile to distinction in production, in art or literature (p 157 *sq.*). The conclusion reached distinguishes between the forces of a transitional era and the influence of democracy proper. The former are adjudged hostile to distinction, but not the latter. But chiefly of value is the sustained tone of calm, reasoned, but exacting morality which breathes in every page. Not for nothing has Professor Cooley perused his Emerson. The Emersonian reach and wit and aphorism are very much in evidence. Like Emerson, too, he has garnered his fruit, leaving no pickings for the would-be follower They will find no forgotten apples to appropriate as their own under Professor Cooley's well-beaten tree of knowledge.

We Two in West Africa. By Decima Moore and Major F. G. Guggisberg, C.M.G., R.E. With numerous illustrations and maps. New York: Imported by Charles Scribner's Sons. $3.50 net.

This is the clever story, told by his wife, of the "going on tour" of the Director of Surveys of the Gold Coast, as the journeys are called which the head of every department makes periodically to see how his staff, scattered through the colony, are carrying on their work, and to keep himself in touch with local conditions and requirements in the various districts. The book is thus not simply an account of experiences in the West African "bush," but describes the methods by which the native is ruled, and the natural wealth of his land is developed through railways, mines, botanical gardens, and agricultural stations established to teach especially the intelligent cultivation of cocoa and rubber.

The first part of the journey was by rail to the gold district, and much space is devoted to the mining industry, whose ultimate success, it appears, depends mainly on the cheapening of transport by the creation of motor roads and railways. Then followed a trip by hammock into Ashanti, in order to determine the boundary between that country and the Gold Coast. Here they were carried into regions never before visited by a white woman. Some of the refinements of civilization, however, had preceded them. In a remote wild corner of the forest they came suddenly upon the chief of a town with his state umbrellas surrounded by a swarm of natives in gay-colored cloths and a half-naked band, consisting of a large drum, two kettledrums, and several fifes. This "struck up 'God Save the King' as we appeared," and at its close the chief and his retinue "started for the town, followed by the band, playing 'Way Down upon de Swanee Ribber,' the drummer beating the big drum for all he was worth, and the conductor wildly waving his wee bit of stick." The news of the coming of a white man and a white "mammie," we may add, had been drummed by bush telegraph the day they set out from Kumasi to every village along the road a hundred miles before them. Occasionally they stopped at the stations of the district officers, and the life of these often "solitary pale-faced, fever-stricken" Englishmen, and the patient discharge of their duties as shown in the long-winded "palavers" on tribal boundaries, give one a high impression of these men whose single aim is to improve the condition of the native.

The larger part of the book is naturally devoted to an account of various experiences while travelling, and many trivial details, especially of camp-life, are recorded, which make it at times somewhat wearisome reading. For the information which it gives, however, it is a valuable contribution to the literature of the Gold Coast. The illustrations, 148 in number, are reproductions of photographs of nearly every noteworthy scene and incident of the journey.

Haremlik. By Demetra Vaka (Mrs. Kenneth Brown). Boston: Houghton Mifflin Co. $1.25 net.

People who see in the position of Turkish women a subject for amazement or regret will find "Haremlik" disappointing or pleasing, as the case may be. The life of the women of the harem as portrayed by Demetra Vaka is neither an unhappy nor a subservient one. Our writer is of Greek descent, born and educated at Constantinople, and married to an American. She should be qualified to interpret the East to the West. To her, then, life in the harem passes in an atmosphere of sunshine and felicity. It is true that Turkish women suffer at times, but that would seem to be only when they are affected by our perverse Western ideas on monogamy. Such instances are, however, rare. As a rule Turkish women scoff at the idea that one wife is quite enough for a man. Sometimes they even take it upon themselves to find an additional wife or two for their husbands. On such occasions, as may be imagined, they display foresight as well as zeal. The new wife, as a rule, brings with her some missing element of happiness. Her presence also serves to intensify the spirit of idealism and self-sacrifice in her predecessors.

In spite, therefore, of her long acquaintance with American civilization, Demetra Vaka maintains that the premature adoption of Western ideas by the people of Turkey in general, and the women in particular, would bring about their destruction. From this standpoint our writer passes in review a number of incidents in Turkish domestic life which carry a certain Eastern tone, but are skilfully colored to suit the taste of romantic American readers. She cannot sufficiently praise the beauty, devotion, and integrity of the true Turkish woman, and she has little sympathy for the revolutionists among them, who find in Schopenhauer, Kant, and suffragette ideals merely unhappiness. A secret meeting of these radicals of the harem is described with something of the abandon of the American reporter. In spite of assurances at the beginning of the book that everything in it is practically true, we find it somewhat difficult to believe that the chairman's address at the meeting in question "ended up with the proposition that six members of the club should be chosen to kill themselves as a protest against the existing order of things." When the president is made to suggest that she, by virtue of her office, should be excluded from participation in the lot-drawing, we are pretty near to burlesque. The women of the harem who, as we know now, played an important rôle in the overthrow of the Hamidian régime, must surely have had more sense than that.

Science.

"The Balance of Nature and Modern Conditions of Cultivation," by George Abbey (E. P. Dutton & Co.), despite the reticence of its title, deals with Great Britain alone. The bulk of the book is thus of value chiefly to Englishmen; but the introduction is of more general interest, being a history of the rise of sporting, fishing, forestry, gardening, and farming in England from the earliest recorded period to the present. The sub-title, "A Practical Manual of Animal Foes and Friends for the Country Gentleman, the Farmer, the Forester, the Gardener, and the Sportsman," defines the specific purpose of the work, which is to

discuss the wild and semi-wild vertebrates —mammals, birds, reptiles, and amphibians —found in the British Islands, in regard to their beneficial, neutral, or harmful relation to the cultivation of crops. Mr. Abbey treats fully of "aids" and "hindrances"; or, respectively, methods of protecting beneficial species, and of trapping or otherwise exterminating harmful creatures. One is rather skeptical of the science of an author who boasts of obligation only to "Wood's Natural History" and to two contemporaneous treatises of equal value. But Mr. Abbey shows himself a close observer, and in food habits at least makes a real contribution to our knowledge of the British fauna. The illustrations are numerous, but are mostly amateurish pen-and-ink attempts, which are almost unrecognizable and might well have graced some volume of a century ago. In a well-bound and well-printed book of 1909 they are merely laughable. The same artist has depicted numerous traps and methods of trapping, and these, considered diagramatically, convey valuable hints, which may be adopted to advantage by farmers in this country. The author is moderate in his statements, but a book such as this should be used with discretion, as a bird or animal may be harmful in one country and beneficial in another; while again its destructive or beneficent qualities may vary with the seasons.

As "Epoch-Making Contributions to Medicine, Surgery, and the Allied Sciences" (W. B. Saunders Co.), Dr. C. N. B. Camac has brought together fundamental articles, now become medical classics, by seven noted authors: Lister, Harvey, Auenbrugger, Laënnec, Jenner, Morton, and Holmes. The object of the book is to give to students "the article which communicated such observations as first placed the subject upon a sound scientific basis." For each author there is a portrait and a list of his writings, and for each, with the exception of Lister, a short biography. To the articles on ether Simpson's pamphlet on chloroform is added. The controversy between Morton, Wells, and Jackson, concerning the discovery of anæsthesia is treated rather briefly, and Dr. Camac unhesitatingly awards the honor to Morton. The existence of other claims is not mentioned. The book is handsomely and, barring a few slight typographical errors in the bibliography, excellently printed, and should keenly interest those medical students—*raræ aves*—who can be induced to read anything outside the required textbooks.

Under the title "Bacterial Food Poisoning" (E. B. Treat & Co.), Dr. C. F. Bolduan gives the reader an annotated version of a little book which Dieudonné of Munich published something more than a year ago. In a hundred pages of text are given the essentials of our present knowledge of poisoning by meat, fish, milk in its various preparations, potatoes, and a few other foodstuffs. It is interesting to see how completely the point of view regarding this question has changed. Not many years ago it seemed as though the ptomaines of Brieger and the tyrotoxicon of Vaughan furnished the solution of these poison problems, and that most, if not all, of the disturbances attributable to foods would be found to be caused by specific substances of this kind. Later researches, often of great difficulty, seem to show, however, that such substances are far less important than certain bacteria, developed in foods that for some reason have gone "wrong," or than the toxic substances they produce, quite different from the ptomaines. Although often too technical and brief for a full understanding of the question, the book is profitable reading for any intelligent layman. The translation is smooth, but there is a slight confusion in the nomenclature of the organisms and the linguistic difficulty, now common to bacteriologists, balloonists, and aviators, concerning the derivatives of *aër* presents itself on many pages.

"Die natürlichen Pflanzenfamilien nebst ihren Gattungen und wichtigern Arten, insbesondere den Nutzpflanzen," edited by Prof. Adolf Engler of Berlin (Leipzig: H. Engelmann), deserves mention as the most complete botanical work ever published. The first volume appeared in 1887, and the nineteenth and concluding volume has just been issued. More than sixty botanists have contributed to it, and the results of their exact and exhaustive researches cannot fail to be gratifying and stimulating to all specialists in this department of natural science.

The Kosmos, Stuttgart, continues to add to its list of valuable monographs in natural science. The latest volume is by Prof. K. Sajó, "Unsere Honigbiene," and deals with the culture of bees in Germany and Switzerland.

Dr. Sarah Hackett Stevenson died in Chicago, August 14, after a three years' illness. Dr. Stevenson was interested in many charitable institutions and was the founder of the Illinois Training School for Nurses, and one of the promoters of the Home for Incurables. She was the first woman appointed instructor in the Northwestern Medical College, and also was the first woman admitted to membership in the American Medical Association. She was born in Ogle County, Illinois, in 1843, and graduated from the Woman's Medical College in 1873. She was the author of a work on biology and various medical papers.

Drama.

Plays. By John Galsworthy. New York: G. P. Putnam's Sons. $1.35.

Those who have felt the irritation of Mr. Galsworthy's subtly interrogative novels will know what to expect from the three plays included in this volume, "The Silver Box," "Joy," and "Strife." The remorseless preying of vital egotism upon dress-parade principles, or, to state it more broadly, the seemingly hopeless conflict of ideal justice with natural instincts—this is the underlying theme. In the "Silver Box" a member of Parliament sacrifices a poor man to save the reputation of his son—justice against the paternal instinct; in "Joy" a mother sacrifices to some extent her uncle and even her own daughter to save her lover—justice against the amatory instinct; in "Strife" the two noncompromising and principled representatives of capital and labor are sacrificed to save their women and children—justice against the instinct of self-preservation. In the end we are all left darkling, troubled, as by twinkling lights extinguished in a great mist. Roberts the labor-leader in the last-named play—by far the most effective of the three—thinks he knows the way out. When his famine-stricken fellows cry, "Give in to Nature," he retorts with rude eloquence, "I tell you, strike your blow in Nature's face—an' let it do its worst!" But Nature strikes back, and Roberts falls. To Mr. Galsworthy there is a bitter reality in the trite phrase, the "problems of life." As yet he has been able to do little but indicate them; indicate them he does with painful pungency and iteration. His plays, consequently, have, like his novels, the interest of difficulties seriously confronted, vividly experienced.

It has been said that the drama of the future will concern itself with the clash, not of characters, but of classes, and Mr. Galsworthy is emphatically a writer of the future, cautiously feeling his way into that vaguely defined and still more vaguely understood socialistic movement which may conceivably characterize the twentieth century as the democratic movement characterized the nineteenth. If such be the case, the future of the drama as a living literary form is dark. But the antithesis of class conflict and character conflict has been too sharply put; there is no necessary incompatibility between them. In fact, Shakespeare's "Coriolanus"—a tragedy, by the way, much underread and underestimated—already demonstrates the possibility of representing the most bitter class conflict in the most tremendous character conflict. Now, the effect of Mr. Galsworthy's plays, in spite of their undeniable vitality, is very far from tremendous. His deficiencies are partly corrigible. He ought not, for example, to waste his energies in imitating the vivacities of Mr. G. B. Shaw, as he has done in the rather futile comedy called "Joy," of which, furthermore, the exposition is very awkward. He ought not to confuse a situation with a plot, which he seems almost to have done in "Strife." He ought to avail himself very gingerly of Ibsenese symbolism. But, above all, he ought to recognize that great drama requires great characters. The modern dramatist, in spite of modern experiments, may still be urged prayerfully to meditate Aristotle's observations upon the character of the tragic hero, and to remember the practice of the Elizabethans. Mr. Galsworthy's leading *dramatis personæ* are not so much feeble in characterization as in character—which is to be deplored because he is possessed of the seriousness, the idealism, and the irony which go to the creation of tragedy.

A new edition of Sidney Lee's "Life of William Shakespeare," now issued by the Macmillan Co., shows thoroughgoing revision. It is not so much that entirely new pages have been added, as that by providing throughout the book details of evidence, what was general has been made specific. The sum total of changes is not more than sixteen pages, but again and again these alterations have compelled a change in pagination. To the list of illustrations has been added a copy of the contemporary inscription in Jaggard's presentation copy of the first folio. In general, this new edition seems an improvement upon the old in its care to bring out the evidence, however persuasive a theory in itself may be. This is clearly a revision which replaces the earlier edition, not an unimportant reissue. It is, however, disappointing that Mr. Lee has not so edited the note on page 40 as to include references to the interesting discussions of the Elizabethan stage by Brodmeier, Wegener, Reynolds Albright, and Archer. Why, too, in the note on page 43 is Creizenach's "Die Schauspiele der englischen Komödianten" omitted?

Art.

GENTILE DA FABRIANO.*

Lafcadio Hearn tells us that a Japanese *daimio* had the right to hew down summarily "an other than expected fellow"—that is, one who accosted him brusquely or in terms not sanctioned by an immemorial etiquette. Towards the artist the public has always assumed this lordly prerogative. The other than expected fellow, whether he calls himself Uccello or Millet, Caravaggio or Whistler, has invariably had his period of faring ill. All triumphant and wise artists have had the grace of concealing their unexpectedness. Raphael came down from Urbino and in a short lifetime revolutionized the graphic design of the world. But he always had the gracious air of a conformist, and, in fact, each work made so little break with the past, and so ingratiatingly prepared the way for the next departure, that men were admiring the School of Athens before they had ceased to adore the fugleman of Perugino.

A hundred years before Raphael, a young painter from the same March of Ancona carried his broadening art from his native hills through the proudest cities of Italy—Venice, Florence, and Siena, to Rome itself. Gentile da Fabriano, like his greater antitype, made the most of a pretty scanty education, drank from many cups, everywhere won for himself friends, honors, and gold, and left a deep if not a permanent impress upon his generation. Every work of his shows a passion for perfection, guided by a prudent sense of means and possibilities. We mark in him a fine economy of workmanship, an elaborate yet not merely cumulative beauty, which betokens serenity both in conceiving the vision and in transferring it to panel or plaster. In short, Gentile da Fabriano came about as near being a Raphael as anybody could who was born to share the bankruptcy of Gothic painting.

Unhappily, time has shorn Gentile of the chief evidences of his power and versatility. We cherish him for a few altarpieces of exquisite feeling and workmanship, giving him a place in our affections with Lorenzo Monaco or the Sienese Sassetta. His contemporaries held a higher opinion of him. In the Ducal Palace of Venice might be seen until the fire of 1577 Gentile's frescoes in the Hall of the Great Council. The very subjects are amazing for a painter whose work, according to Michelangelo, was "as gentle as his name." In one panel the young Fabrianoese (his latest biographer sets these works as early as 1410) depicted the naval battle in which the Venetians conquered Otto III, the son of Barbarossa. On this work we fortunately have the opinion of a critic of the high renaissance, Francesco Sansovino, who praises the entanglement of the galleys and the fury of the combatants—precisely those qualities of energy in which Gentile seems deficient. Of the companion-piece which represented a storm, the chronicler Facio writes that "the sight of the whirlwind uprooting trees, etc. [alas that etc.!] struck with fear those who beheld it." Of the chapel which Gentile painted in the ancient Broletto of Brescia we know not even the subject. But Facio tells us of the frescoes representing the life of John the Baptist painted in the Lateran, 1427, that Gentile, as if presaging his imminent death, here outdid himself. And, happily, Facio gives better testimony than his own as to the excellence of these works. Rogier de la Pasture, the greatest northern painter of his age, came to Rome in 1450. "Greatly taken with the Lateran frescoes, he inquired who the painter was, and, heaping him with praise, placed him before all other Italian painters." The incident suggests that affinity between Gentile's work and that of the north which must occupy us later. It proves more poignantly still the loss we have suffered in the destruction, save a not very important fragment at Orvieto, of all of Gentile's mural painting. And yet there remains the possibility that, as the great fresco by Guariento was found injured but still fine behind the Paradise of Tintoretto, in the Palace of the Doges, so Gentile's two frescoes painted for the same hall may some day be rediscovered behind the sixteenth-century canvases that have replaced them. Until that day we must judge and enjoy Gentile by what is presumably the least important part of his work. In trying to reconstruct imaginatively these lost masterpieces we may assume that they abounded in figures and action. In some fashion they may have resembled the vivacious narratives of the earlier Florentines, Agnolo Gaddi and Spinello Aretino. But we get a finer intuition of them by recalling that they forecast the monumental compositions of Gentile Bellini, and more remotely prelude both the delightful story-telling of Carpaccio, and such a romantic picture as the enigmatic St. Mark and the Demons which criticism ascribes now to Giorgione, now to Palma Vecchio.

We must turn back and try to imagine Gentile's beginnings. The date of his birth is unknown to us, but it cannot have been much earlier than 1480. Until his thirtieth year, roughly speaking, when he went to Venice, he painted in his native city. What could he have learned in the March of Ancona? A good deal, perhaps, but rather little that was consistent or helpful. If French realism was latent in the Carca, the ostensible influences were of quite another sort. The Gothic-Byzantine of Venice still prevailed widely, but Siena had conquered the towns. Everywhere one finds in the Marca panels which betray the teaching, or at least the authority, of the Lorenzetti and Simone Martini. From Assisi there had also been a transmission of Giottesque influence, but at Assisi, too, Simone Memmi and Pietro Lorenzetti loomed large, and on the whole the March of Ancona preferred to Giottesque austerity the dulcet Sienese mood. The best exemplar of these pervasive influences was Alegretto Nuzi, the true founder of the Fabriano

**Gentile da Fabriano*, by Arduino Colasanti (Bergamo: Instituto Italiano d'Arti Grafiche), is a compact and scholarly monograph abounding in carefully sifted information, much of which is new, and adequate also on the critical side. Dr. Colasanti prints a document from the Lateran archives which definitely fixes the death of Gentile in the year 1428, confirming the general chronology of Vasari. The position of the lost frescoes in the Lateran has also been accurately ascertained. The polemical part of the study is largely devoted to the always dubious matter of an independent school of painting in the Adriatic Marches. Our author takes the affirmative view, and makes the most of a rather unsatisfactory case. Again in tracing the undoubtedly widespread influence of Gentile sometimes one questions whether what is called Gentilesque is not merely derivative from Siena from which he himself drew so much. But in general Dr. Colasanti will command a cautious reader's confidence. We take serious issue with him only for helping to fix upon the little Madonna with Sigismondo Malatesta, in the Louvre, the too ambitious attribution to Jacopo Bellini. Its obvious superficial affinities with Jacopo's work will hardly survive an æsthetic analysis of the picture itself. With all its charm, it has no characteristic to justify the ascription to any great master. Like all the Bergamo monographs, this book is fully illustrated with half-tones of good quality.

school and Gentile's master. Those who are lucky enough to recall the Umbrian exhibition at Perugia will not need many words about Alegretto. There he shone in a peculiar biltheness. He is less mystic than his exemplar Simone, more frankly sentimental, and his coloring is hardly less exquisite. Uneven in invention and workmanship, a true provincial in his qualities and defects, he yet displays a peculiar inwardness in his best pictures. We should remember him gratefully, for without him we should hardly have that most delicious of late Gothic Madonnas, Gentile's little masterplece in the museum at Pisa.

Gentile's earliest picture, the Coronation of the Virgin at the Brera, shows little of the eclectic character that was later to be prominent. It seems to go behind Alegretto to those Gothic painters who retained much of the Byzantine feeling. At the base of the central panel a segment of the crystalline sphere bends over the sun, the moon, and the stars, and here is proudly set "Gentilis de Fabriano Pinxit." Upon this arch kneel eight tiny angels playing musical instruments—a motive frequently found on Gothic-Byzantine organ shutters. On the expanse of gold above is incised a blazing aureole to receive the figures of Christ and his mother. They are seated upon clouds, the gold embroidered borders of their robes are whipped into calligraphic loops after the fashion of Siena and the late Byzantine painters. The head of the Virgin is bowed and her slender hands crossed in humility. The Christ reaches up from below and sets the crown gently in place with the suave gesture of a priest touching an infant's brow in baptism. His free hand rests lightly upon his knee and holds erect a tiny cross. The partly exposed lining of his mantle repeats the stellar pattern at the base of the composition. Above, the Father, vestured in a rich dalmatic, reaches his hands towards the divine heads in approval of the rite. In the irregular space between Christ and the Virgin hovers the white dove of the Holy Spirit, not displayed stiffly and heraldically, as is usually the case, but swinging across the space as if about to alight. While the picture is by no means deficient in emotional seriousness, it is chiefly remarkable for the beauty of its gold and tempera enamel, and for minor evasions of the underlying symmetry—artifices which give to this hackneyed theme a peculiar freshness and vivacity. More serious in some ways are the tiny figures of saints which are minor features of this altarpiece. Some stand radiantly "upon the softe swote gras"—a greensward half-hidden by growing flowers; others kneel in their wildernesses, like St. Francis at La Verna; others, like the Aquinate, sit contemplatively over a book in a monastic garden plot. These miniatures betray more clearly than the central panel the tenderness of Gentile's Sienese forerunners.

Yet it seems to me that when Venice called Gentile to paint in the Palace of the Doges she merely reclaimed her own. He inaugurated, as we have seen, her school of monumental decoration; he became the teacher of that pioneer of the renaissance, Jacopo Bellini. Gentile's too-little known Madonna in the Jarves Collection, New Haven, has a breadth of style that looks forward even beyond Jacopo to the triumphs of his greatest son, Giambellino. Venice made Gentile famous. Popes and tyrants began to compete for his brush. For Pandolfo Malatesta, at Brescia, he painted for more than four years. But the frescoes in the Broletto have long since disappeared, leaving no trace even of their subject. We know Cosimo Tura saw them in 1469, and presumably disapproved, for the stern Paduan manner then had the cry. In the autumn of 1420 Pope Martin V, already planning his triumphal return to St. Peter's throne, sojourned in the Brescian territory and invited Gentile to come with him to Rome. Nearly a year later a safe conduct for eight men and horses was issued to the painter, but both Pope and painter had to postpone the Roman visit for several years.

For Gentile at least the delay was golden. He proceeded to Florence, and there, among other works, completed an enthroned Madonna with Saints for the Quaratesi family; and for that prince of humanists, Palla Strozzi, the Adoration of the Magi, a picture beside which only Lorenzo Monaco's Coronation of the Virgin in the Uffizi holds its own as a perfect expression of late Gothic design. But before we pass to the Adoration, we perhaps do well to recall the Florence that Gentile saw with an artist's eye.

We must suppose he had the self-esteem without which one would hardly be an artist at all. He would soon have found that only Don Lorenzo Monaco, who was painting in the Trinità, and Masolino, who had begun the stupendous decorations of the Brancacci Chapel, were regarded as his peers. People perhaps talked of an eccentric young painter named Paolo Uccello, and of a youth of genius who served as assistant to the great Masolino. But Masaccio's day was yet to come. Fra Angelico was probably absent in Umbria; in any case, he had not yet asserted himself as a mural painter. In short, Gentile found himself almost without rivals of his own quality and bade fair to repeat at Florence his Venetian triumphs. No great decorative commission seems to have been given him. In fact, since he had put himself at the disposal of the Pope, he could hardly have accepted any prolonged task. But he found time to execute for Palla Strozzi that radiant Adoration of the Kings which, formerly in the Church of the Trinità, is now a chief ornament of the Florence Academy. No one who has seen this picture forgets it, and for those who have not seen it, of what avail are many words? More than an Adoration of the Kings, it is a Triumph of Chivalry, so completely does knightly pageantry outweigh its charming religious sentiment. Lorenzo Monaco had already perceived this possibility of the subject. He was the first Florentine to draw out the escort of the Magi upon an oblong panel. Indeed, the Adoration, which he painted for the little Church of St. Lucy in the Ruins may have served as a model for Gentile. But the newcomer outdid his exemplar. Never had the courtly and spectacular features of the scene been so fully developed. Gentile has raised the horizon to the top of the picture, in order to have more space in which to deploy his cavalcades. Beside the reverent group of the Holy Family and the worshipping potentates, is a dense and jostling throng of arrested horses, grooms, knights, men-at-arms. A great hound crouches before the hurly-burly, above it and behind a falcon strikes a dove and two monkeys balance on the humps of a dromedary. Over a hedge and the grotto where the ox and ass munch peaceably, one looks to a high-lying distance divided into three scenes by as many arches of the rich frame. To the left, the Three Kings look over the sea towards the Star in the East. In the centre, their cavalcade, with prancing horses and hunting leopards on the cruppers, swings up a hill towards a city. To the right, the Magi enter the gate of Bethlehem. Above, in the crocketed pinnacles, are medallions with God the Father, the Virgin, and the Angel of the Annunciation. Below, in the base, the Nativity, and the Flight to Egypt, a night scene, and a dawn, in which the lights are effectively touched with gold. The third predella panel, the Presentation in the Temple, is represented only by a copy; the original, since Napoleonic times, has been in the Louvre. The Gothic side columns are treated as if they were of skeleton construction. From a dark background within the mouldings painted flowers spring as if planted within. The gilding and varied tempera enamel afford a gorgeous and yet harmonious effect. Diapered gold, lapis blue, crimson, these are the prevailing colors. In technical brilliancy, no panel of the century surpasses this radiant work of Gentile's.

The group of the Holy Family is draped after the traditional half-classic fashion, the remaining figures wear splendid costumes of the time, with minor Oriental features. This picture is the transition to the realistic *genre* manner of the Quattrocento in Florence. The step from it to those frescoes with state-

ly citizens as witnesses of the ostensibly sacred theme is a short one. Now, this sense for pageantry and love of contemporary faces and costumes appear very early in French miniature painting. It has been suggested, in fact, that both Gentile and Masolino got their hint from such pictures as those of the Limbourg illuminators and Hubert van Eyck. All this is possible, and even plausible, but I think it is easy to exaggerate the importance of this northern influence. Pageantry was in the air of Florence. The religious spectacles, the jousts, the ceremonials of the guilds constituted a festal year affording every variety of processional display. On St. John's day this actual subject, the Adoration of the Magi, was occasionally given with great splendor. Machiavelli describes a performance of 1466 that was elaborate enough to occupy nearly the whole city for several months. In the Marches, the Adoration was given as early as 1380. In 1414, at Parma, we have a record which might be a description in brief of Gentile's picture painted eight years later. Now, this love of pageantry rarely found full vent in the religious painting of the time. Such a picture as this of Gentile's, such a Cortège as that which Benozzo Gozzoli some thirty years later spread on the walls of Cosimo de' Medici's private chapel, remain in a manner exceptional. It was the humble, usually nameless, painters of storied bride-chests (*cassoni*) who were the true recorders of this vanished Florence. To them all was permitted. Through them we see the wedding feasts, the jousts, the horse races, the triumphs. With them we may wander in gardens of love, or enjoy in the fantastic travesty of the dawning renaissance the old, sad stories of Virgil and Ovid. Truly inheritors of unfulfilled renown, for we rarely know even their names, these blithe craftsmen were the real illustrators of Florence in its heyday and on parade. Gentile and Masolino were the great predecessors of these little men, though Paolo Uccello was to be their chief exemplar. They represent the full flood of a tendency already vigorous in Gentile. If northern, or more specifically French, influence comes in at all, is it not merely by way of confirming an established taste? Alas, those days of significant pageantry! In England they are reviving the traditional spectacles with learned care; among ourselves mysterious orders of chivalry parade in knightly panoply. We strive arduously for the spectacular, and we get the results of those who strive too consciously. Perhaps the realists are right—Whitman in Brooklyn Ferry, Renoir in the Dancing Garden, our own young arranger of sombrely splendid pageants from the New York ghetto, Jerome Myers—perhaps they are right, I say, to eschew the arranged for the casual spectacle. And yet with the sense of travesty departing, is not the casual spectacle also doomed—I mean as regards its appeal to the eye? This, too, would be of a piece with a civilization that willingly starves the eye in the alleged interest of the mind. Is it not significant that at a time when society gives the artist so little to look at, the writer pushes description to its furthest extreme of technical excellence? What does that mean but that the naïve joys of the eye have been superseded by a more complicated pleasure—one fairly within the range of a blind person? How can the painter and sculptor hope for a real place among us, until we concede to the claims of the eye—not that attention we gladly pay to those of the ear, but at least that respect which we give to the higher exactions of the palate?

We have drifted far from Gentile. But really little remains to say. We find him at Siena and Orvieto, repeating his Venetian and Florentine triumphs, and finally, at derelict Rome, helping to dignify the return of the Pope. Gentile painted at Sta. Maria Nuova and in the Lateran, at that time the first temple of Christendom. There death overtook him suddenly, in 1427, still in joyous possession of his powers. He was buried at Sta. Maria Nuova, but time has cancelled his epitaph and even exact memory of his last resting place.

Any judgment we may form of his painting, is defective in advance. His most important work we know on hearsay only. For us he is preëminently the master of blithe color, the inventor of certain soft appealing forms of woman's loveliness—what Madonna picture in the world is sweeter than the little panel in the Museum at Pisa?—the contriver of vivacious spectacles, the celebrator of dying chivalry in the full-blown splendor of its decline. For the rest, a simple spirit, carrying to the point of perfection the technique and forms he had inherited; a contented soul when divine discontent was in the air; an innovator only to the extent of enriching established formulas. In every way, he seems one of those gracious spirits whose pious task it is to invest in an ultimate charm, an art no longer capable of real progress and foredoomed. The wistful flavor of decadence is in all his panels. They have, as compared with Gothic painting of the great time, the insubstantial flavor of Campanian marbles, as compared with those of early Attica. In both cases, the vague provincial suggestion is a weakness, but constitutes also an appeal. Our judgment approves Masaccio for his break with an exhausted past, our love goes out to Gentile for his unquestioning fealty to old and beautiful if tottering ideals. I could almost resent a discovery, say of those hidden Venetian frescoes, which should demonstrate that Gentile, too, was an innovator. That he was that in a measure, there is reason to believe—but a progressive spirit, not in the sense of the realists, but of Fra Angelico or Fra Filippo Lippi. Why Fra Filippo is not a realist, I cannot here take the pains to explain. As a wholesome sentimentalist, and lover of the human spectacle, he was, in some degree, the spiritual heir of Gentile.

FRANK JEWETT MATHER, JR.

The July *Burlington Magazine* is not at the highest level of interest attained by that periodical, though it contains several articles of some importance. The note by Georges H. De Loo on "An Authentic Work of Jaques Daret" should fix a date and a name in the heretofore rather vague history of early Flemish painting; while A. M. Hind notices some "Newly Discovered Rembrandt Documents," published by Dr. Bredius, which upset the received chronology of Rembrandt's etchings and show that that master continued to etch and to engrave up to the end of his life. Among the illustrations the most interesting are reproductions of several pictures lately in the collection of the King of the Belgians (two by Rubens and one by Hobbema) and a couple of rather timid works put forward by C. J. Hl. as possible early experiments by Vermeer of Delft.

The special spring number of the *International Studio* is devoted to the water colors of J. M. W. Turner. There is a growing feeling that this part of Turner's work is the best of what he has left us, and these thirty reproductions of drawings, ranging from the stiff formality of the earliest exhibited work of 1790 to the amazing sketches of the early forties, will be welcome to many. There are the inevitable contradictions in the text, Sir Charles Holroyd dwelling on the "absolute truth," even to the smallest details of locality, of Turner's sketches, while Mr. A. J. Finberg maintains that they must not be regarded as "attempts to give an accurate representation" of anything, even of effects. Mr. W. C. Rawlinson's detailed discussion of the plates and of Turner's successive manners at different periods of his life is perhaps more profitable.

The Académie des Beaux-Arts has announced its awards in the architectural section in connection with the Grand Prix de Rome. The chief prize went to J. G. M. Boutterin, a pupil of Rauiin and Héraud. The prize next in value was taken by M. J. E. L. Madeline, a pupil of Degiane, and the third by G. E. Lauzanne, a pupil of Laioux. Two other awards of the Académie are the Prix Troyon to Émile Marcel and a *Mention Honorable* to Mlle. Marcelle Louis Noyon.

From Kiel comes the report of the death, in her eighty-first year, of Prof. Johanna Mestorf, who until a year ago was director of the Schleswig-Holstein Museum in that town. Her title of "professor" was conferred on her by the Emperor, in 1899, and she was the first German woman to be so honored. Besides her administrative work she wrote a number of volumes on archæological subjects.

Finance.

THE UNION PACIFIC'S ASSETS.

For a week past, the Stock Exchange has been indulging in great excitement over what it describes as the expected "segregation plan" for the Union Pacific Railroad's holdings of stocks of other railways. In general, Wall Street's idea appears to be that these stocks—amounting by the company's last report to $108,000,000 pledged against collateral trust bonds, and $131,000,000 held free in the Treasury—will somehow be transferred to other custody, so that the railway company, as such, will be disengaged from the business of operating on the stock market. As to what method of segregation will be pursued, no official statement or intimation has been given out; it is, therefore, impossible as yet to discuss the matter from that point of view. Speculative Wall Street, after its fashion, jumped to the conclusion that the "deal" would be so arranged as to impart great additional value to the Union Pacific's shares, which were accordingly bid up 16 points last week, with a relapse at the present week's opening. This throws no light on the project; the Stock Exchange, in its present mood, would do the same for the shares of any property in which a "deal" was rumored. But the "segregation plan," whatever form it take, happens to be a sequel to a very sensational chapter of railway history, which it is well worth while to review.

The Union Pacific's purchases of stock in other railways, on the scale which has made its operations memorable, began when the so-called "community-of-interest" idea had turned the heads of our Wall Street millionaires. This plan of action was based on the purchase of one another's shares by the various railways, the purchase-money being raised on the credit of the purchasing company. It will be recalled that the process was largely at the bottom of the frenzied markets of April, 1901, when the buying power which converged on the Stock Exchange seemed to be absolutely unlimited. The Union Pacific had thus bought $75,000,000 stock of the Southern Pacific Company, bonding itself for the purpose. This operation attracted less attention, because its main purpose was to acquire the Central Pacific line, which, although owned by the Southern Pacific, was a natural connecting link to the Western Coast for the Union Pacific's main transcontinental line. But the ease with which this property was acquired stimulated the appetite and relaxed the caution of the rich "insiders." The contest, first for possession of the Burlington and Quincy, and then for the Northern Pacific Railway, followed a few months later.

It was conducted on lines which, a very few years before, would have been described as unparalleled recklessness. Union Pacific's executive committee had virtual *carte-blanche* with the company's credit; Harriman himself, as chairman of the board, had been voted practically unlimited borrowing powers, with the absolute right "to execute in the name and on behalf of this company a note or notes for the amount so borrowed." Although no official admission of the fact has ever been made, there is no doubt whatever that the $78,000,000 par value in Northern Pacific stock, bought by the Union Pacific in 1901, was purchased with money borrowed in the open market on the notes of the company. This highly precarious operation was supplemented later by a bond issue to take up the floating debt thus created, and a fortunately favorable money market averted the grave perils which must always surround such experiments with corporation credit. The Northern Pacific corner, the exchange of the stock for that of the Northern Securities holding company, the dissolution of that company, occurred without disaster to Mr. Harriman's undertaking.

He sold on the open market the stock received on the liquidation of that merger, and got more than he had paid for it. The speculation had been lucky, and in the middle of 1906, Union Pacific was left with $55,000,000 free cash in its treasury. No idea of reducing the capital liabilities incurred in the purchase, or of devoting this money to the urgent physical needs of the railway property, seems to have occurred to Harriman. Instead, he rushed into the speculative Wall Street market, buying right and left the shares of other railways, many of which had no connection with his own. The $55,000,000 cash was not enough; the Union Pacific incurred a floating debt of $75,000,000 more, and the proceeds were similarly used. Such an operation, secretly conducted and accompanied by wild speculation ascribed to the people who knew what was going on, was bound to take rank as a public scandal when the facts were made public. That service the Interstate Commission rendered, and the people at large learned the truth of the matter at the moment when Union Pacific was struggling to place its bonds in an unfavorable money market, and when, by rough calculation, the market value of the stocks bought for the company in 1906 had depreciated $40,000,000. Since then, and up to the present time, there have been fairly well authenticated reports of buying and selling operations for the same account, and in the same shares, on the Stock Exchange.

The panic of 1907 sobered up a good many millionaire speculators who had come to believe that there was no limit

The Facts About 6% Irrigation Bonds

We are the largest sellers of Irrigation Bonds. And these bonds are, by far, our most popular securities with investors who know them.

Our experience with Reclamation Bonds covers 15 years. It covers the sale of many entire issues from 11 separate states. So we know the facts.

These bonds are farm liens of the most conservative class. Some are Municipal obligations. The interest rate — six per cent. — is larger than one can now obtain on any large class of equal security. The bonds are issued in serial maturities, and in denominations as low as $100.

For the information of our customers—present and prospective—we have issued a book called "The World's Greatest Industry." It is interesting, unbiased, clear and illustrated. It tells the facts about this most attractive form of investment. Please write us a postal or send us this coupon for it.

of safety to their use of credit. Probably some of Harriman's own associates began to feel misgivings over the policy so recklessly pursued, and to protest against its continuance. It had, moreover, become quite plain that unless our great railway corporations were to become mere engines of speculation, and their trust funds only handmaids of the Stock Exchange, a halt of some sort must be called. The most that they could discover, in the way of remedy for the situation created in Union Pacific's own finances, was some scheme for turning over the company's holdings of other railway shares to a separate company, or at all events, for placing immediate control of them in different hands. It will occur to all observant minds that a plan of this sort might leave the last state of things as objectionable as the first. But comment on this aspect of the matter must be deferred until the nature of the contemplated "segregation plan" is known.

AN EDUCATIONAL NUMBER

It will contain several pertinent articles, the leading being by Prof Wm. MacDonald on Summer Schools in the Universities. Recent text-books will be reviewed.

4,000 extra copies will be mailed to teachers in schools and colleges.

Usual rates for advertising.

The Nation.

NEW YORK, THURSDAY, AUGUST 26, 1909.

The Week.

The Attorney-General, the Secretary of Commerce and Labor, the Secretary of the Interior, the chairman of the Interstate Commerce Commission, and the Solicitor of the Department of Justice are, it is said, to furnish President Taft with material upon which to base recommendations to Congress. The legislation relates to the powers and functions of the Interstate Commerce Commission, the amendment of the Sherman Anti-Trust act, and additional safeguards against corporate abuses. Some profess to see an innovation in this recommendation of specific statutes to Congress. President Taft, however, is not only an able lawyer himself, but evidently constituted his Cabinet so as to entrench himself as behind a bulwark of distinguished legal advice. His experience with the tariff bill, where the corporation tax was of Cabinet manufacture, may have convinced him of the utility of having a measure in definite white and black to urge upon the attention of the lawmakers. This plan, even if in some degree novel—and we are not at all certain that precedents cannot be found for it—is at least rather more dignified than the back-door deal in patronage to buy legislative approval of particular measures. However, if the experiment is actually tried, it will but register the growing inclination to trust the Chief Executive, rather than Congress, with the initiative in measures taken in the interest of the nation as a whole.

President Taft is reported to be not at all disturbed by the news that the corporation tax is to be taken into the courts, to test its Constitutionality. He expected this. He knows the ways of lawyers, and only laughs when told of their eager preparation for the great battle. But he should not forget that a similar hilarious incredulity was displayed in 1894, over the proposal to challenge the income tax in the Supreme Court. Why, it was *res adjudicata;* the Court itself had upheld the validity of the tax, and how ridiculous it was to imagine that it could be upset. But it was upset; and Mr. Taft cannot have forgotten the innocent smile with which Mr. Choate remarked, when all was over: "Well, some things can be done as easily as some other things." It is, of course, true that very able and experienced lawyers agree with the President that the corporation tax is not obnoxious to any Constitutional principle; but just as many take the other view, and what the courts will hold cannot be predicted.

Acting Secretary Reynolds of the Treasury Department has come forward as an authority upon official æsthetics. There are two provisions in our tariff law, the one providing for the free admission of works of art over one hundred years old, the other for similar products more than twenty years old. The unsophisticated person might imagine that the effect would be the free admission of any work of art more than twenty years old. But such an opinion differentiates the untutored Philistine from the Treasury connoisseur. The regulations just issued discriminate 'twixt tweedle-dum and tweedle-dee very nicely. The twenty-year provision is to be strictly construed. Under its terms, nothing is held to be a work of art, which can, by any possibility, minister to aught but the æsthetic sensibilities. "Nothing suitable for purposes of utility," so reads the edict, "such as tapestries, paper hangings, glass windows, ornamental clocks, chandeliers" or other furniture may gain free admission under this proviso. The one hundred-year provision, however, is to be construed with the liberality which is of right paid to age. With the single exception of rugs and carpets which are denied free admission though they might come from the palaces of the Pharaohs, any work of art over a century old is welcomed, despite its possible utility. Thus, if one buys a dozen Apostle spoons, he may bring them in, duty free, for kitchen use, if he chooses; but a lace handkerchief that was made subsequent to Fulton's navigation of the Hudson is promptly charged with its appropriate duty. Secretary Reynolds seems to have answered with wonderful acumen the Conundrum of the Workshops:

> And the first rude sketch that the world has seen was joy to his mighty heart.
> Till the Devil whispered behind the leaves: "It's pretty, but is it art?"

It is a pity that Congressman Fowler's attack upon Speaker Cannon is so personal and so violent in language as partly to obscure the real gravity of his charges. People cannot be got to work themselves into excitement over the fact that one Representative, rather than another, is made Chairman of the Committee on Banking and Currency. Recriminations on that score will fall rather flat. Only languid interest can be taken in the assertion, on the one hand, that Mr. Fowler's deposition from his chairmanship will yet rank as "the crime of 1909," or in the retort, from the other side, that his lamentations are nothing but the wails of a "squealer." Much more to the point is the exhibition of the Speaker's very bad record in matters of public finance. We ourselves have shown that he was on the wrong side in every financial measure of capital importance, having voted regularly for all the inflation bills and silver bills, and against all the sound measures—even the repeal of silver purchases, in 1893—that have come up in his time. If currency reform is to be left to the tender mercies of a public man so ignorant and narrow and perverse as Speaker Cannon has shown himself to be, we can only say, Heaven help the reformers.

The bloodshed at McKee's Rocks should surprise no one who has watched the progress of the conflict between the Pressed Steel Car Company and its employees. A disgraceful civil war has virtually been raging at the works. No less than 3,000 men have been under arms on the side of the strikers alone; daily fusillades have been reported, and yet the State of Pennsylvania has not acted except by ordering out a handful of constabulary. Whatever the merits of the strike, if the company is able to man its works the State owes it to itself to protect the company's property and the lives of the men it employs. If the strikers have a just cause, they are only injuring it by resorting to violence. Bul-

lets will restore no man's job and will merely harden the hearts of the employers. Killing strike-breakers feeds no hungry mouths and alienates public opinion without which no such strike can be successful. Punishment of unjust and cruel employers can come generally only through that same public opinion.

On the other hand, we feel quite as strongly that the time has gone by when employers can take such a stand as President Hoffstot takes toward his men. If the statement is correct that a skilled riveter worked ten days and two nights, and then received only $6.50 pay, and that another employee of seven years' standing worked ten and one-half days and received only $14.95, when he had formerly earned $30 in the same time, there is every reason why the company should have met its employees and discussed labor conditions in an amicable spirit. To institute order is, we insist, all-essential for every one concerned, but as the Pittsburgh *Sun* put it: "More important to Pittsburgh than her tonnage output is the making of good citizens out of all who labor here. He is an optimist, indeed, who can see any good at all in such economic conditions as are bared in this strike and attendant rioting." For an official to refuse to arbitrate where no principle is at stake, but merely a question of wage rates and hours of labor, is to prove one's self not only entirely out of touch with modern economic conditions, but entirely too autocratic and unreasonable to have charge of the destinies of thousands of employees.

At last, Mr. Taft is caught in deliberately, unblushingly, and wickedly reversing one of his predecessor's policies. We hasten to call it to the attention of the muck-raking magazines. West Point reveals the parting of the ways. It is only eight months ago that Mr. Roosevelt was confronted with a hazing case involving five cadets. He knew that the law required the dismissal of these men; that the Academic Board of West Point was unanimously in favor of letting the law take its course; that the superintendent, Col. H. L. Scott, had publicly declared his apprehensions for the discipline of the Academy if the cadets were permitted to go over the heads of their military superiors. But Mr. Roosevelt knew better, and true to his habitual custom, he let no such little thing as a Congress-made law stand in his way. Now, Mr. Taft deliberately reverses Mr. Roosevelt's humanitarian policy, without a word of explanation or justification, and seven poor "boys" must undergo the "entirely needless hardship of being turned out." Nothing is said about their being sent back for one year—there is merely, at Beverly, a craven desire to abide by the law which prescribes dismissal for each hazer, without alternative.

Secretary Wilson of the Department of Agriculture might well be content to allow the department year book just issued to stand as his *nunc dimittis*. In the twelve years that have marked his administration of the department, he has seen the staff grow from 2,444 to 10,420—due to the increasing duties loaded by Congress upon this branch. The period has witnessed an increased average production per acre of such staples as cotton and corn, the former rising in the ten years prior to 1906 from 172 pounds to 191 pounds per acre. Of course, this advance may connote even more than a corresponding outlay per acre, but it may be due in part to more scientific and more economical cultivation. The Secretary is very sanguine as to the American farmer's ability to provide food for any possible growth of our population. His declaration that as regards wages the "farm laborer has fared better than the workingman employed in manufacturing and mechanical industries" raises the query whether this wage increase in an essentially non-protected industry is compatible with the protective shibboleth which the Secretary's party has always uttered. Not the least of the services which the farmer renders is the international credit his exports create in our favor—a factor of great importance just at this present juncture, when gold exports are large enough to be sobering.

With the mimic war in Massachusetts over, the country may now rest in peace—until there shall have been drawn from the manœuvres the inevitable dread lessons. Meanwhile, we are very happy for the regular army that it has achieved so glorious a victory. We can well imagine the heart-burnings in the service if a mere militia general, with an inferior force, had outwitted three of our shrewdest regular army generals. That we felt sure was an impossibility, unless General Pew should prove a Napoleon in disguise. As for the lessons to be drawn from these field exercises, without in the least pretending to military wisdom, we are really to wager a field gun against a cocked hat that they demonstrate, clearly, the utter defencelessness of our coasts and the absolute necessity of, at least, 20,000 more coast artillerymen—or, should we say 30,000? At the same time, it is pleasant to record that in this war game the various State troops seem to have conducted themselves extremely well and demonstrated anew their military progress since 1898.

The oft-repeated tale of our annual fire-waste was never more cogently put than by Mr. Edward T. Campbell last week at the Trans-Mississippi Congress at Denver. Losses by fire in the United States, he declared, cost three-quarters of a million dollars a day. In 1907, the entire fire-bill reached a total of $456,000,000, or about one-half of the total value of new constructions in the same year. The neglect of collective hazard in the matter of high or non-fireproof buildings is the chief reason why our per capita fire losses are about ten times as great as those in Europe. There is in this country no adequate recognition of the fact that fire losses are never ultimately indemnified, and that fire insurance premiums are essentially taxes imposed upon the community to spread the losses over a period, rather than to compel individuals to incur the same losses in lump sums at a single time. It is refreshing to see how frankly the West can be told of its errors in the matter of insurance. Mr. Campbell pointed out fearlessly that the three States of New York, Pennsylvania, and Connecticut practically insured the country, because of their reasonable laws governing insurance.

There have been gross misrepresentations sent out regarding actions of the Department in certain matters. Criticisms have been pretty severe from some quarters; but knowing that I am absolutely right in the position I have taken I have paid no attention to them. In time it will be shown beyond a doubt that my course has been all right.

In these words, according to a dispatch to the New York *Sun* from Butte,

Secretary Ballinger has commented on the various attacks upon him. "At the same time," he went on, "I realize that there are some things in the law governing the disposition of public lands, which ought to be modified, and as soon as I shall have opportunity, I shall suggest such changes as appear to me to be necessary, and report to Congress." In the meantime, Mr. Ballinger says, the established policy of the Interior Department will continue. It is hard to see why even Mr. Pinchot should not be satisfied with this.

A dispatch from San Francisco asserts that President Wheeler of the University of California has established a strict censorship over all news emanating from that institution. It can hardly be the case that the so-called censorship applies to matter other than official announcements of university policy or action which should rightly emanate from the university authorities. The dispatch in question, however, relates that "a curt letter has been sent out forecasting trouble for any professor or instructor who discloses anything concerning the working of the institution to reporters." In view of some of the sensational reports that emanate from university centres, it is easy to sympathize with President Wheeler. May not, however, the desired end be approximately reached, if discretion is exercised in the choice of a staff of instruction? Liability to epigrammatic seizure may well disqualify for a faculty position a candidate otherwise qualified. The judicious organization of a university bureau of publicity coöperating with a press bureau composed of student reporters has eliminated many of the cruder evils which unregulated and sensational newspaper exploitation of universities formerly occasioned.

The action taken by the School Board of Chicago against Greek-letter secret societies in the public schools is no doubt wise. And, indeed, clubs and social organizations even in the university, where the students are older, are, at the best, not an unmixed good. The recent action of Chicago University in dropping one hundred students brought a statement from the president that one cause of low scholarship was too great "social" interest. That, perhaps, is partly true, but a greater objection to strictly organized societies is the exclusion from the larger university life that membership often implies. They, too, often lead to a certain snobbishness and chauvinism, to a general narrowing of the sympathies. There should, of course, be social life at the university, which, broadly considered, has as its primary end the introduction of the student to the widest life, intellectual and cultural, and that includes the social. But the narrower and more intense social life involved in the strictly organized "society" often works against the wider and more humane outlook.

We can hardly believe that the verdict of $20,000, given by a St. Louis jury against a physician of that city, because he sewed up in a patient a roll of gauze, will stand in the higher courts. More intelligent persons will, we are sure, feel that to proceed against this cherished practice of some of our most distinguished surgeons will be an undue interference with their liberty and their pursuit of happiness, and, therefore, quite unconstitutional. And what would become of the newspapers, if they could not record from time to time that the great surgeon B., or the wonderful operator C., had carefully sewed up an unsterilized instrument or thirty-six inches of gauze in the place of a recently removed appendix? We are the more concerned because this is the second verdict of the same kind which we have noticed during the last few weeks. Now we submit that physicians are but as human as the rest of us, and that to require general infallibility while operating is a little bit more than the medical profession can be expected to endure in silence.

Financial legislation in the British Parliament contrasts favorably with the analogous process in our Congress. The budget proposals emanate from the Ministers, and are presented to the House of Commons on the collective responsibility of the entire Cabinet. Then in the Commons, the scheme is canvassed both in its totality and in minutest detail. During the debate, which, as in the present case, often extends over weeks and months, the closest outside scrutiny of the measure is kept up under the sharpshooter fire of the press on both sides. The bye-elections, during this time, give to Parliamentary leaders and to the country at large a good inkling of the pulse of popular opinion. As a result of these combined processes, the dross is pretty thoroughly refined out of a budget measure, and the eventual statute is at least a consistent whole. It is not pleasant to compare such a method with the dark-lantern process of our legislators, from the first secret concoction of a measure in the secluded rooms of the majority of the Ways and Means Committee, to its final hasty signing by the President.

The elimination of specific features from the pending Finance bill very well illustrates the peculiar excellence of the British process. Virtually, the aim of the measure is to secure large amounts of additional revenue, both for the navy and various schemes of social reform, without resorting to a protective tariff. Two main sources of new revenue chosen are a tax on the increment value of land, and a super-tax levied on incomes of over £2,000. But so radical a departure in finance had involved various dubious expedients. The excision of those excrescences one by one has resulted from the complex process of criticism, while the basic principles of the budget are left intact. Thus the cost of the land's valuation, it was proposed originally to impose on the owner. The hardship this would have worked in individual cases was made so clear that the state now undertakes the valuation and will pay the cost thereof. The failure to provide appeal for the taxpayer was pointed out by the Lord Chief Justice in a public address. As a result of this criticism, an appeal has been allowed. The somewhat whimsical tax on ungotten minerals could not stand up against the ridicule it occasioned, and has been replaced by a tax on mining royalties. As a result of this open, public, and above-board discussion, the finance measure has steadily grown in popular favor. The bye-elections and public political meetings have shown an apparent stemming of the adverse political tide. The Lords' bluster about throwing out the budget is growing beautifully less, and even Mr. Balfour is said to have advised them against such unprecedented action. The result shows the unquestioned value of publicity in the legislative handling of financial measures.

ARITHMETICAL NAVAL STRATEGISTS.

How can a science be both exact and inexact? This question is inevitably suggested by the settlement of the great naval dispute in England over the administration of the fleet, between Admiral Beresford and Sir John Fisher. Both profess themselves wholly satisfied with the outcome; both feel that they have been overwhelmingly sustained by the sub-committee of the Imperial Defence Committee, and Beresford is able to tabulate eight distinct reforms which his crusade has compelled the Admiralty to introduce. Let no one believe, however, that the peace now established is to be of long duration. Naval officers must be fighting always, if not in their dreams or in their play, then each other. Now this is a very queer thing, because our naval lords are ever dictating to the statesmen of the world what they shall tax the people. No professional man on the whole globe so readily has his way or is listened to and obeyed so zealously. The navy man knows each year just how many ships will prevent the despoiling of his native land, and each year he reports with sorrow new dangers and greater needs. But when it comes to administering his own province, this superman is in hot water all the time; his infallibility ceases when the threshold of his own special field is invaded. Whether it be how navy yards should be conducted, whether marines should or should not be on ships, whether a naval general staff is or is not desirable, the service is certain to be split asunder, and naval science appears at once anything but a science.

Let a naval officer but enter the field of international relations, and all his professional doubts vanish. His fears remain, for he is the most timid of mortals, seeing death and destruction everywhere, if the proportion of his battleships to those of some one else is not exactly as he thinks it ought to be. Thus, we now have an ever-increasing number of amusing, because so serious, arithmetical naval strategists. In solemn earnestness they set in opposing columns the lists of battleships and auxiliaries of the various Powers, find their own navy a poor second in the comparison, and immediately scent disaster to the integrity of their nation. Naturally, there follows a demand for still more ships and a fervent appeal to patriots to act promptly and vigorously, lest all be lost in a terrible *débâcle*. That other countries are adding yearly to their fleets, making our permanent superiority wholly out of the question, escapes the arithmetician's notice. With a sigh of relief, he solves his little problem, points with pride to the result, and tells us that when we have a predetermined number of Dreadnoughts, then, and not till then, we shall be safe.

The latest apostle of the vicious doctrine that only by predominant naval strength can the United States exist to carry out the plans of the founders and prove to an astonished world the practicability of orderly self-government based on universal suffrage, is Commodore W. H. Beehler of the navy. In an article in the current *Proceedings of the Naval Institute*, entitled "The Navy and Coast Defence," he gives the conclusion to which his imagination, his arithmetic, and his exact science irresistibly lead him. "To protect the country, our navy must command four different spheres, the Atlantic, Pacific, West Indies, and Philippines. Command of the sea in these four spheres is essential, and it can only be attained by an adequate naval force." Granted the premises, and the outcome must be accepted in a fleet strong enough in each of these theatres of war to overpower any antagonist. Delightfully simple and obvious. He would be unpatriotic, even perchance, a mollycoddle, who should ask whether this Union might not survive with less, rather than more, armored vessels; who should brutally point out the impossibility of reconciling this gigantic expansion with the President's flat order to reduce the naval appropriation by at least thirty millions of dollars; or who should suggest that by a single act of justice to the Philippines the assumed need of one of these fleets would disappear entirely.

The arithmetical naval strategist is not like other men. He lives in a world of his own where he blows his little bubbles and maps out the only possible scheme of salvation, with serene indifference to the actualities of life. It is a matter of course that he should coin new and sonorous phrases such as "strategic line of force" (whatever that may be); should advocate "a fleet of armored cruisers" (a discredited and obsolete type); should dot the wide oceans with scouts cruising continually in search of the enemy (how happy to find him at last, like the old lady who nightly looked for the burglar under her bed); should recommend fortifying such hopelessly exposed cities as San Diego; and should call for five vice-admirals, forty-two rear-admirals, and other officers and men in proportion. Very sapiently and in italics Commodore Beehler lays down this proposition. "*If we command the seas no foreign naval force can attack our coasts.*" Of course, dear arithmetician, who ever said it could?

Some day there will arise a Lewis Carroll properly to satirize the Beehlers, the Deweys, the Beresfords of our day; to place the Mad Naval Officer alongside the Mad Hatter, the White Rabbit, and other immortal logicians. Meanwhile, we would simply submit to our statesmen who listen in such awe to every graduate of our Naval Academy, that naval officers' decisions in matters international would be much worthier of credence and acceptance, could they but reach a common understanding in a field admittedly their own. A science exact and yet hopelessly inexact is, we submit, an anomaly, particularly when, dealing with human beings, it begins its theories by confessing a total lack of faith in the human equation. The very exactness of their science prevents their taking into account national characteristics, conditions of discipline, and relative efficiency. In his worship of the battleship, our arithmetician behind the gun sees no one in the conning tower, at the sights, or in the engine-room. A battleship is to him a battleship and nothing more.

THE GENERAL STRIKE.

The most recent advices from Stockholm indicate pretty plainly the failure and impending collapse of the Swedish strike. The struggle was unusually interesting for several reasons: it was perhaps the nearest approach to a universal strike ever attempted; it was conducted on the whole peaceably, so that the economic power of the unions was tested with little admixture of alien forces; it was fought out among a homogeneous people, where the introduction of immigrant strike-breakers was vir-

tually absent. The complete history of the movement we may not obtain for some time, but the indications are that its ill-success has removed many of the predicted terrors of the general strike.

In its theoretic aspect, nothing would seem more menacing than a universal stoppage of labor. Most urban communities have had some experience of the extreme inconvenience that a tie-up of the local transit system will produce. Multiply this by whatever factor represents the totality of hand-workers, and it should seem as if anarchy or social revolution must result. In France, indeed, this is the connotation which the term—general strike—carries. It is only another name for the hoped-for supersession of the government of the bourgeoisie by the labor unions. It is true that the extensive strike in Paris earlier in the year was spoken of as a general strike. But this was only by anticipation or by mistaken usage. The policy of organized labor in France, it must not be forgotten, is to ignore the existing government, to abstain from asking beneficial legislation from the Parliament, and to prepare for a *coup d'état*, whose alias is the general strike. In Sweden, as in most Teutonic countries where labor's attitude is largely opportunist, the general strike is expected to operate within the framework of existing institutions, and by sheer economic necessity to effect the granting of labor's claims.

The first cause of the weakness of the general strike is the failure to make it really general. It is not likely that all classes of operatives will feel aggrieved at one and the same moment. Those whose condition is for the time being fairly satisfactory have an aversion for a sympathy strike. Their attitude is:

The distant Trojan never injured me.

While they may be coerced by the urgent claim of the solidarity of labor, they find it difficult to forget their individual grievance at having to quit work. Many classes again, even of hand-workers, are not unionized. The Swedish farmers seem to have repulsed all suggestions of coöperating with the striking urban operatives. On the other hand, some of the best organized unions refuse flatly to go out at the behest of an unrecognized labor leader. Those who are in public employ are particularly chary about quitting their posts. Thus the soldiers and the police in Sweden seem to have been mindful of the services expected of them by the state. Even the paupers supported at public cost, when ordered to perform certain tasks, such as burying the dead at Stockholm, feared to decline, dreading the cessation of the support now received from the public chest.

A second major reason which accounts for the general strike's missing fire is the quick-spreading alienation of public favor. The strikers themselves are surprised to find how numerous is the rest of the community. Where the struggle is restricted to an out-and-out fight between a single trade or corporation and its operatives, and where a good *prima-facie* case can be made out for the strikers, public opinion is generally inclined to support the more numerous party. People put up good-naturedly with no little inconvenience in the hope that it may aid the workmen. But when the public in the rôle of *amicus curiæ* has its toes stepped on; is compelled to walk in rainy weather as well as in sunshine, because of suspended transit; has to put itself on siege rations, and depend upon the police for the distribution of the children's milk, the beauties of the general strike begin to fade, and a prompt clamor arises for stringent enforcement of the law, and, if necessary, for an industrial dictatorship to protect society at large from the warring factions.

When cases growing out of such industrial conflicts finally come up before the courts, and the conduct of the parties defendant is scrutinized in the dry, cold light of statutes and precedents, the law is generally found to be peculiarly unsympathetic to these attempts to coerce employers and incidentally to starve and inconvenience the public in the process. Perhaps no part of our law in this country is more conservative than that bearing on the legality of strikes. Originally, at common law, both in England and America, all strikes were unlawful. This extreme position has long been vacated, but courts still restrict with extreme caution the objects for which a strike is a lawful expedient. Anything that savors of the boycott or the sympathetic strike is likely to be treated with short shrift. The sharp doctrine is laid down that only to better the terms of *the strikers' own employment* is a strike lawful. Employees in public service corporations, moreover, are assumed to have obligations co-extensive in kind with that of the corporation. So in many other trades and professions, striking is not the privilege of any moment. A surgeon who suspended an operation to haggle for a higher remuneration would probably land where operations are limited to picking oakum.

The final weakness in the universal strike is that it cuts both ways. Strike funds lose their efficiency when everybody is on strike. The story is told of an ambitious young strategist at West Point who asked his instructor why fortifications were not built in the form of a circle so as to be "equally strong all around." The gray-haired instructor opined that such a fort would be "equally weak all around." Something of this kind is discovered in the general strike. Its instigators are going to starve society into submission, and then discover that their own larder goes bare just a trifle before that of their opponents. We doubtless shall have many sore trials before our industrial organization is perfected, but it is comforting to believe that the general strike is rather more terrible on paper than in fact.

WRATH AND GOLF.

We are glad to see the *Spectator* questioning the legend of the infuriated golfer. It is one of the ancient conventions of golf—or of those who talk and write and make jokes and draw comic pictures about the game—that it constantly provokes its votaries to wrath, malice, and all uncharitableness. But if that were ever largely true, it has certainly ceased to be so. It is indeed the case that you will occasionally see an unfortunate player in a hideous bunker or trap, burying himself deeper in sand and bad language, but that is exceptional. The dear old stories about the golfer who in a fit of rage breaks every club in his bag, and vents his fury upon man and nature impartially, relate to prehistoric times, even supposing they were ever true. The choleric majors, the passionate pilgrims of the links, the caddies fleeing from the wrath to come, the scarred bosom of the fair green, the air quivering with profanity—all this has more to do with the humorous tradition of the game than with its actual practice.

The present race of golfers are among the most equable-tempered and well-poised of mortals. Watch them at their play, and you cannot but be struck with the sedate way in which they go about it. Mental absorption, concentration of the whole physique, intent study of each shot, and a strained following of the flight and fall of the ball—these are the main things that impress the observer, and they are totally inconsistent with the intermittent explosions of ungovernable anger which he may have been led to expect. The devotees of the links exhibit frequent gleams of jollity. They have their jokes with each other, their side remarks, their mock praise, their acid comment—all between intimates, and never violating the etiquette of the game—and a part of their fun is melodramatic posing and violent outcries, when calamity overtakes them, as if despair had seized them for its own. This may mislead the bystander, but the others know that it is only feigning.

Compelled to admit this fact, some persons, steeped in the beloved tradition of the wrathful golfer, put a wrong interpretation upon it. They say that golfers are becoming better tempered. If the Comminatory Service is not so often read on the links as it used to be, it is because men have grown ashamed of their senseless objurgations. They are convicted of sin by quiet and well-behaved companions, or, possibly, by the presence of ladies on the green or on the club-house piazza, and set about mending their manners. Their patience becomes schooled by the discipline of the game itself, and they are less prone than before to let the sun go down upon the links and their wrath at the same time. Now, we are reluctant even to appear to take anything away from the moral glories of golf, and should be only too happy if we could make out the game to be the nursing-mother of all the virtues; but we fear the ugly fact is otherwise. It is not moral striving, but the endless struggle for excellence in the game, that leads the earnest golfer to avoid tempestuous and unseemly raging.

It is a question rather of psychophysics than of morals. The acutest analysis of golf shows it to differ from all other games in the degree of fixed attention it requires at the moment of the stroke. There is no reflex action to help the player. The game never becomes automatic. The impulse, the initiative, the summoning up of the whole man, have constantly to be under the golfer's control, and he speedily discovers that he cannot get on without a nice nervous poise. He learns that the most trifling external accidents—a temporary indigestion, loss of sleep, business worry—will put him off his game mysteriously, and he is not fool enough to add anything in the way of internal excitement, if he can help it. An oath a hole is almost like giving his opponent a stroke a hole. Hence, the self-restraint and heroic calmness under misfortune which he displays, are only proofs that he is trying to play the game well. It is not a moral scruple that holds him in. If swearing more terribly than the army in Flanders would cut his handicap, the air would be blue about him; but he is well aware that madness lies that way, as well as strokes over bogey. The choice of clubs is not more important than the cultivation of an equal mind. Greater is he that ruleth his spirit, and maketh a fine recovery, than he who taketh a city, or captureth the gallery, by a brilliant drive. Ebullitions of rage mean not only bad taste, but a bad score. Herein lies the explanation of the fact that so many good golfers seem to have steeled themselves to the mischances of their favorite sport, and to have taken as their motto: *Savis tranquillus in undis*, which may be translated, "Don't get mad even if you drive into a water hazard."

A WORD FOR AUTUMN.

St. Nicholas for September prints a number of brief essays by boys and girls, written in a prize competition, upon the theme, "My Favorite Season—and Why." Their excellence consists in their spontaneity and in their natural, unsophisticated analysis of their delight in the out-of-doors life. The contributions are none the worse that they betray no inkling of a reminiscence of Thomson's "Seasons." But among those deemed worthy of the prizes there is none, if we except one, that sings the glories of Indian summer, which betrays a partiality for autumn. This predilection for one of the other three seasons is characteristic not alone of children, but of their elders.

Autumn is unquestionably the least spectacular season. Spring appeals to the sense of novelty, to the expectation of release from confinement, to the pleasures of hope. With women, it is almost universally the favorite. To them the earth's "divine renewal" has a symbolical meaning which "mere man" cannot wholly perceive. If, in the spring, the young man's fancy proverbially turns to thoughts of love, it turns thereto "lightly," almost casually, and not improbably because the young man has a touch of spring fever. To the athletic temperament, summer is alluring. The sense of untrammelled freedom in the out-of-doors, the escape from school tasks, the vacation from business, or the unalloyed delight in sport and exercise find in summer their fittest opportunity. On the other hand, winter has a double claim. The æsthetic charm of snow and ice, with their zestful sports, tells in its favor. Winter, moreover, carries for the children the lure of Yuletide festivities, and for their elders the pleasant sense of shut-in isolation and family solidarity peculiar to the open hearth.

But it must not be forgotten that each season has the defects of its qualities. Spring, especially the early spring, is *varium et mutabile semper*. Then you can never tell what a day may bring forth. The one thing certain is that it is dangerous to let the fire in the furnace go out. Neither the ground nor the temperature affords occasion for the hardy sports of winter, nor the vigorous out-of-doors existence that summer brings. The illness that mortal flesh is heir to is always lurking about the turn of the year, and every schoolmaster will bear witness that childhood's epidemics usually cluster around the traditional spring vacation. The joys of summer are often purchased at a heavy cost. The conscious effort after bodily comfort is incessant. To speak of heat and humidity and dust is superfluous, but every one has sympathized with Sidney Smith, who "found there was nothing left for it but to take off my flesh and sit in my bones." But the discomforts of wintertime are worse. Then, if ever, one agrees with Mr. Squeers in his verdict that "natur' is a rum 'un." The white veil of snow which has so often been idealized means weeks of slush. The wizard architecture of Jack Frost means frozen water pipes and plumbers' bills, not to mention the colds

and coughs and influenza that hold revel.

To the eye of experience, therefore, the fall of the year may rightly have a claim as the most auspicious season. No greater libel was ever uttered than the allegation that the closing days of November, the "saddest of the year," are fairly typical of autumn. It is more than half due to the prejudice of the poets that the "season of mists and mellow fruitfulness" bears so bad a name among its fellows. Whenever a rider of Pegasus feels lachrymose, he is almost sure to work in some slander on the autumn. Thus Tennyson felt:

> Tears from the depth of some divine despair
> Rise in the heart and gather to the eyes
> In looking on the happy autumn fields.

No wonder that he confessed he knew "not what they mean." Here in autumn, is found the even tenor of all the year as summer heat melts imperceptibly into the invigorating charm of cooler days. The harvests are all but gathered in. The grapes and apples and nuts presage a cheer that never attaches to the precarious peach crop. Even with its slow progress towards winter, the autumn is prodigal of gifts:

> When the frost is on the pumpkin,
> And the corn is in the shock.

As one grows in years, performance and not promise takes an added value. It is broad-shouldered Ceres, with her lap full of good things, not the willowy and changeable "Aprille with his shoures soote," that challenges our regard. We come to dread the sudden change and climatic extremes. "Sometimes too hot the eye of heaven doth shine" for us to remain quite unblinded by his rays. But in the clear light of the hunter's moon we see things as they really are.

THOMAS HOOD.

I.

It cannot be thought that a new life of Hood was widely desired, nor does the writing* of Mr. Walter Jerrold show that charm of manner which makes us grateful for unimportant things. Yet, at least, the biography is the result of honest painstaking, and has the solid merit of correcting traditional errors and of offering a considerable amount of new material. It is well enough to be assured that the true date of Hood's birth in London was 1799; to have an exact relation of his years in Scotland, 1815-1817, when, according to Mr. Jerrold, his determination was formed to devote himself primarily to literature, rather than to engraving; and to know that his marriage, in 1825, was not in opposition to the wishes of Miss Reynolds's people and brought no bitterness to his amiable heart. It may even be that there is still a sufficient number of admirers of Hood's humor and pathos —among whom, indeed, I count myself —to justify the fuller printing of his mad letters and the telling of all his madder practical jokes. There may be some who will welcome the complete story of his stay on the Continent from 1835 to 1840, with its rollicking German friendships; who will read willingly the lengthened record of his struggle against failing health during his last five years in England, and to hear his brave deathbed profession of faith, almost his last remembered utterance:

> It's a beautiful world, and since I have been lying here, I have thought of it more and more; it is not so bad, even humanly speaking, as people would make it out. I have had some very happy days while I lived in it, and I *could* have wished to stay a little longer. But it is all for the best, and we shall all meet in a better world!

Through the troubles and anxieties caused by illness and, it must be added, by imprudence in money matters, Hood preserved this buoyant cheerfulness. One comfort comes from this biography—although Mr. Jerrold did not quite intend it—in dispelling the supposed tragedy of Hood's life, which would have him driven by grinding necessity to the production of vendible comicalities. At the very beginning of his career Barry Cornwall is exclaiming to a friend over the pity "that Hood should have given up serious poetry for the sake of cracking the shells of jokes which have not always a kernel"; and so the tradition has been passed down to us of a fine creative artist who deliberately diverted his talents to the popular market, with all the misery of such a conscious degradation. There was, no doubt, a vein of delicate pathos in his genius, but no one can read this life without feeling that not the hateful *res angusta* but the inevitable bent of his mind made him from boyhood to the fading years of sickness the jester of England. His "National Tales" in prose (published early in 1827), were a deliberate effort to prove his rights to another name.

> The serious character of the generality of the stories [he says in his preface], is a deviation from my former attempts, and I have received advice enough, on that account, to make me present them with some misgiving. But because I have jested elsewhere, it does not follow that I am incompetent for gravity, of which any owl is capable; or proof against melancholy, which besets even the ass. Those who can be touched by neither of these moods rank lower indeed than both of these creatures. It is from none of the player's ambition, which has led the buffoon by a rash step into the tragic buskin, that I assume the sadder humor, but because I know from certain passages that such affections are not foreign to my nature. During my short lifetime, I have often been as "sad as night," and not like the young gentlemen of France, merely from wantonness. It is the contrast of such leaden and golden fits that lends a double relish to our days.

All which is perfectly true, but it did not save the "National Tales" from being a flat failure. As for "Tylney Hall," his attempt at sustained fiction, its character is indicated by Dickens's praise of it as "the most extraordinary jumble of impossible extravagance and especial cleverness"; or by Lamb's admiration of its puns as "so neat, that the most inveterate foe to that sort of joke, not being expectant of 'em, might read it all thro' and not find you out."

II.

It was as the inimitable equivocator in words that Hood won a reputation among his contemporaries, and will be remembered. In *Blackwood's Magazine* for April, 1830, an unknown rhymster hit off a number of English writers in quatrains, ending with Hood:

> Im*pugn* I dare not thee
> For I'm of *puny* brood
> And thou would'st *pun*ish me
> With *pun*gent hardiHOOD.

The foolish lines show the place of Hood in literature, though the puns employed are, as Mr. Jerrold rightly says, not at all of the genus that gave Hood his fame. His letters overrun with quibbling conceits; his pencil could scarcely draw a picture without a play in forms; his practical jests were a kind of amphibology in act—"the equivocation of the fiend!" we are likely to exclaim at the last, in wonder and dismay.

The fact is the pun has got a bad name in society, and Hood—dare we add Lamb also?—as its devotee would probably be shunned to-day as a bore in any club of London or New York. There is some reason for this unpopularity of a once admired species of wit, for it is subject to a woeful abuse. In his "Shirley Brooks of *Punch*" Mr. G. S. Layard gives too numerous illustrations of what the profession of punning soon came to be; for horrid example:

> One summer evening Thackeray arrived late at the *Punch* dinner. He had given up a lady's dinner for a dinner with Lord John Russell, and the little statesman had left him in the lurch. "So," he said, "I come as a *peas-aller* to Mr. P. to eat my peas in peace."
>
> "But you must mind your Q's as well," said Shirley, "and you must take your cues from me or I shall not excuse you."

Peculiar taste in entertainment! Let us pray for it an everlasting *requiescat in pace*. It should be added that the Victorian afterwits were not the first

**Thomas Hood: His Life and Times.* By Walter Jerrold. New York: John Lane Co. $5 net.

or only ones to bring the double-tongued Muse into contempt. Early in the forties of the eighteenth century, Mrs. Elizabeth Carter had planned a *jeu d'esprit* on "The Whole Art and Mystery of Punning," calculated "to furnish the sweet *nepenthe* of nonsense in such copious streams as to water the face of the whole earth." The prospectus should be perused by all intending sinners. "To so great a height of perfection," she declares, "have the authors of this work carried their design, as to lay down rules to divide, subdivide, compound, recompound, decompound, rack, torture, strain, and quodlibetificate any word into a pun by nineteen several ways of false spelling."

III.

But the pun is not necessarily and was not always this criminal act of verbicide, as Oliver Wendell Holmes has called it; an evening with Theodore Hook, we may remember, could wring from Coleridge the exclamation that he was as great a genius as Dante. There is a pleasant reward in going back now and then to the group of wits who treated punning with the scrupulous delicacy of a fine art; and of this practice Hood, at least, so far as the *litera scripta* can decide, was the incomparable master. There is some exaggeration in saying, as a reviewer in the *Spectator* wrote not long ago, that "Hood's pioneer work—Hood's own unique work—was the punning ballad, which may be said not only to have begun, but in its best form to have died, with him." That is to pass a little too lightly over the work of many writers before Hood's day; more particularly it is to forget the ballads of Goldsmith, such, for instance, as the stanzas on "Mrs. Mary Blaize," which would seem quite in place if found in "Hood's Own." It is to forget also the excellent absurdities of the "Ingoldsby Legends" and other later works. Yet it is true that Hood remains the inapproachable master of the pun in all its shades of excellence, and to understand his humor, and indeed his fancy, is to practise a useful discrimination among the different kinds of equivocation. Charles Lamb, as a connoisseur in the art, pointed the way to the right classification, when, in his remarks on the "Odes and Addresses," he censured his friend not for excess of wit, but for the occasional use of the wrong sort of wit.

> What we allude to [he writes] is a mixture of *incompatible* kinds; the perpetual recurrence of *puns* in these little effusions of humor; puns uncalled for, and perfectly gratuitous, a sort of make-weight; puns, which, if *missed*, leave the sense and the drollery full and perfect without them. You may read any one of the addresses, and not catch a quibble in it, and it shall be just as good, nay better; for the addition of said quibble only serves to puzzle with an unnecessary double meaning. A pun is good when it can rely on its single self; but, called in as an accessary, it weakens—unless it *makes* the humor, it *enfeebles* it.

What Lamb means, as becomes evident from his comment on the humor of the "Ode to Joseph Grimaldi, Senior," but what he does not quite say, is that the pun succeeds when it plays primarily on the double sense of a single word and not on the mere similarity in sound of two words. The late Canon Ainger, in his "Life of Hood," comes closer to the real distinction, while hinting at a larger classification:

> Herbert, Crashaw, Donne [Lamb had made the same comparison with the "metaphysical" poets], in like manner, have their abundant and perishable affectations. Yet all of these in turn show how true wit may subserve the highest aims of the Poet; and that in fact, so far from Wit and Poetry being irreconcilable, they shade and pass into one another by gradations quite imperceptible. Who shall decide, on the moment, whether Waller's couplet—
>
> The soul's dark cottage, battered and decayed,
> Let in new light through chinks which time had made—
>
> is to be pronounced witty or poetical? The truth is that it is both; and that the two are fused, beyond possibility of separation, by the intensity and sincerity of the Truth enforced.

Now Waller's couplet, as Canon Ainger might have pointed out, is at once both poetical and witty just because it contains an uncertain play on words hovering midway between the true metaphor and the avowed quibble. Its position is clearer if we compare it with two stanzas which turn on different equivocations of the same word. In Cardinal Newman's hymn—

> Lead, kindly Light, amid the encircling gloom,
> Lead thou me on;
> The night is dark, and I am far from home;
> Lead thou me on.

we have sheer poetry, with no suspicion of wit. The pun, if we may use the term in so generic a sense, lies in those physical qualities of light which the mind has always and instinctively associated with the moral qualities of the spirit. There is an equivocation of ideas, if you insist; but without the element of surprise, and springing from a deep similarity of emotional content. This is, properly speaking, metaphor. At the other extreme lies such a stanza as this epitaph on a lamp-lighter:

> Faithful at lighting lamps thou wast,
> Till soul and body grew so light,
> That one is wafted now with dust,
> While t'other shines a star of night.

Here is the pun in its vulgarest form—a pure quibble, whose whole force is in the unity of sound of two distinct words "light" as opposed to dark and to heavy, and whose wit, if it have any, rests on the element of surprise alone. Between these two, the metaphorical and the quibbling use of the word, stands Waller's witty comparison, which is raised by its play on sense rather than sound above the quibble, yet which so dwells on the physical accessories of light, and so depends for its effect on the unexpected turn, as to be strictly, not a poetical metaphor, but a conceit.

IV.

These are the three terms of figurative speech—the quibble or base pun, the conceit, and the metaphor. For the most part Hood ranges on a ground below the middle term and above the lowest—on a ground which may be designated the legitimate pun. Not always, indeed; for at times, he, like other wits, forgets to resist the first temptation of his own cleverness. Thus a catch in an old Scotch ballad, "cauld, cauld, he lies beneath the deep," may set him off on a long chase after words whose only association is their similarity of sound:

> But still that jolly mariner
> Took in no reef at all,
> For, in his pouch, confidingly,
> He wore a baby's caul;
> A thing, as gossip-nurses know,
> That always brings a squall!
> . . . .
>
> The ensuing wave, with horrid foam,
> Rush'd o'er and cover'd all.—
> The jolly boatman's drowning scream
> Was smother'd by the squall,—
> Heaven never heard his cry, nor did
> The ocean heed his *caul*.

But more often there is a kind of accompanying twist in the situation itself, playful or grotesque, which raises the humor above the exasperation of sheer verbicide, as in "Faithless Nelly Gray" or the less grewsome "Sally Brown":

> O Sally Brown, O Sally Brown,
> How could you serve me so?
> I've met with many a breeze before,
> But never such a blow.

And this twist may become the very substance of the humor, so that the play on words is lost in what may be called the equivocation of circumstances, or the pun in things themselves. So it is throughout the "Parental Ode":

> Thou little tricksy Puck!
> With antic toys so funnily bestuck,
> Light as the singing bird that wings the air—
> (The door! the door! he'll tumble down the stair!) . . .

V.

Hood's manner of punning is an old story no doubt, and needs no interpreter. But it may not have been so often remarked that the trick pursues him even into his solemn moods; is, indeed, in more or less disguised form, one of his efficient instruments of pathos. There was a vein of melancholy in the man, nor was he, as he says, "incompetent for gravity." He was in this respect like other humorists who have turned lightly from laughter to tears, but he differed from others in his ability to measure sadness with a conscious pun:

All things are touch'd with Melancholy,
Born of the secret soul's mistrust,
To feel her fair ethereal wings
Weigh'd down with vile degraded dust;
Even the bright extremes of joy
Bring on conclusions of disgust,
Like the sweet blossoms of the *May*,
Whose fragrance ends in *must*.
O give her, then, her tribute just,
Her sighs and tears, and musings holy!
There is no music in the life
That sounds with idiot laughter solely;
There's not a string attuned to mirth,
But has its chord in Melancholy.

Perhaps it is the fatalistic pun luring the mind from beneath the more manifest metaphor of *may* and *must* that gives a peculiar piquancy to these lines, as if under a masquerade of sorrow we should catch glimpses of a face not smiling, but itself sorrowing. Such an audacious quibbling with melancholy leads one to reflect on the intimate mixture of laughter and tears in some forms of art, on the slender partition in human life between joy and sadness, or what may be called the ambiguity of the emotions. They stand so near together and pass so easily one into the other for the reason that their cause is so ambiguous; for regret and disappointment, like the merry accidents of life, though to different ends, spring from a kind of disparity between expectation and event. The only peculiarity of Hood is that he uses the juggling with words more consciously than other poets to express the juggling realities of fate. Thus, were it not for the harshness of the term, the ambiguity of sleep and morn and the soul's secret mistrust in "The Death-Bed" might almost be called punning:

We watch'd her breathing thro' the night,
Her breathing soft and low,
As in her breast the wave of life
Kept heaving to and fro!

So silently we seem'd to speak—
So slowly moved about!
As we had lent her half our powers
To eke her living out!

Our very hopes belied our fears,
Our fears our hopes belied—
We thought her dying when she slept,
And sleeping when she died!

For when the morn came dim and sad—
And chill with early showers,
Her quiet eyelids closed—she had
Another morn than ours!

Is our perception here merely quickened by our familiarity with the equivocating habit of the writer, or has this habit really led him on more audaciously than others to that verge of sentiment where the instrument of pathos is almost confused with that of humor? The latter is the case, I think; for I observe that he carries this same tendency not only into his other pathetic poems (making of this same likeness of sleep and death in one passage of his "Hero and Leander," at least, a pure conceit), but into all the emotions. It would be tedious to hunt out the various illustrations of this lurking wit in his poems of awe and regret and indignation and fancy; it would even tend to disconcert us in our enjoyment of his delicate craftsmanship. Only one example I cannot pass over, for its comment on the ambiguous charm of beauty:

O saw ye not fair Ines?
She's gone into the West,
To dazzle when the sun is down,
And rob the world of rest:
She took our daylight with her,
The smiles that we love best,
With morning blushes on her cheek,
And pearls upon her breast.

To Poe these lines had "an inexpressible charm"—as indeed to whom have they not?—and I think it is not extravagant to say that some part here of that "petulant, impatient sorrow" (the word is too strong) which Poe connected with the incomplete realization of beauty in art, is due to the teasing duplicity introduced by the word "West." The emotional impression of the whole poem is too fine and pure to class it as a conceit; it is metaphor of the truest sort. Yet withal the realism of the action of the second line, the insistence on the similarity of physical motion, adds a certain whimsical element, as if a metaphor might at the same time be a conceit and—let us not say a pun, but—a play on words. Not the least of the interests attaching to Hood's work is this persistent amphibology of his genius. Better than in almost any other writer, we can, in him, follow poetic wit through all its gradations of quibbling and conceit and metaphor, where, indeed, these are not blended together in a kind of sublimated punning. We seem thus at times to come very close to the equivocation that lies in the human heart, too close, it may be, for the uses of great poetry. We are reminded too coarsely that the powers of literature are only figures of speech, just as Brutus, after serving virtue for a lifetime, found it in the end, not a thing, but a word. P. E. M.

NEWS FOR BIBLIOPHILES.

In a recent letter giving some notes about that famous Italian book of wood-engravings, the "Hypternomachia Poliphili," Venice, 1499, it is said that "an example has been acquired recently by Mr. J. Pierpont Morgan." As a matter of fact, Mr. Morgan owns, and has owned for a long time, three copies of the first edition. One of these, in an old blue morocco eighteenth century binding, is perhaps the tallest copy known, the leaf measuring full 12½ inches in height. It is from the Brayton Ives Library, and in the sale catalogue was described as "large paper" and as having been "bought from Morgand of Paris, and said by him to be unique." All copies were no doubt originally alike as to paper, some having been trimmed closer than others. Mr. Morgan acquired the book with the Theodore Irwin collection. His second copy, only one-eighth inch shorter, is in citron morocco by Roger Payne, a fine and authentic specimen of the work of this famous binder. It was formerly in the collection of Mark Masterman Sykes, and later in that of James Toovey. The third copy, from the Richard Bennett collection, is in a superb binding of brown morocco, richly tooled, and bearing on each cover the famous device of Demetrio Carnevari, physician to Pope Urban the VIII. Examples of books bound for him are as rare and as highly prized by collectors as those from the libraries of Grolier and Maioli.

The book seems to have been of so much interest, even in early days, that special bindings were put upon many copies. In the strictest use of the word it is not at all a rare book—probably a hundred copies might be traced—and while its value seems to hold in the auction room, it does not materially increase. The Beckford copy, in an old Venetian binding, brought £130 in 1883, and the Turner copy £137 in 1888. These prices have, we believe, been only twice exceeded at public sale. Charles V's copy brought £151 in the Earl of Ashburnham's sale, June, 1897, and on November 3 of last year, £159 was paid for the Newton copy, in blue morocco by Derome. This was a very tall copy, 12⅝ inches, the same height as the Toovey-Morgan example.

Of the second edition of the book, which is no doubt actually rarer than the first, and which was printed in Paris in 1545, Mr. Morgan has two very fine copies. One is in an Italian binding of brown morocco of the sixteenth century, the back and sides very richly gilt and painted in colors. This volume was exhibited at the Burlington Fine Arts Club Exhibition in 1891. The second copy is in the original vellum covers.

The Third Quarterly Part of Karslake's "Book-Auction Record," covering sales in London from April 1 to June 30, 1909, and recording 5,511 lots, is just ready. But few items of exceptional rarity or interest are included in this part, the most notable being the volume in old binding containing five pieces (or, more correctly, four, two having been published together) from the press of William Caxton. This volume, one of the most interesting of Caxton books to come into the auction market in recent years, was sold on May 21 to "Stanley" for £2,600. It was, it is now reported, "bought in" for the owner, and has since been disposed of privately to Mr. J. W. Ellsworth of New York city. Mr. Ellsworth is perhaps best known as the owner of the Brinley-Cole-Ives copy of the Gutenberg Bible and of the Daly set of the Four Folios of Shakespeare, although he is the owner of many other rare books.

PRACTICAL EDUCATION.

To the Editor of The Nation:

Sir: Your editorial of August 5, upon "Student Activities," continuing as it does a long series of adverse criticisms upon our present college administration, states what is patently true, but fails, it seems to me, to give the fundamental reason for the eclipse of the curriculum by the "activities," or to suggest any useful remedy. If the undergraduates at our colleges or in

the arts departments of our Eastern universities concentrate their interest on athletics, journalism, debating, fraternity management, and similar pursuits, it cannot be wholly due to their juvenility or barbarism. If alumni habitually look back upon their college "activities" as the most valuable part of their four years of undergraduate life, it cannot be all sentimentalism. There must be some radical failure on the part of the college itself to meet the wants of these young men. It is a commonplace observation that the same youths who have idled through their college courses become enthusiastic workers in technical or professional schools; whereas only the grind—that is, the person who expects to turn his college course to advantage as a teacher, or as a means of paying his tuition through a scholarship—takes the college work seriously.

In the opinion of one whose fate it has been to teach in both Eastern and Western institutions, in large colleges and in small, the indifference of our undergraduate to his college studies arises from the absence of any more definite aim in his curriculum than "general culture." The courses offered and to some extent prescribed are those which every "gentleman" might well know; but the undergraduate, confronting Latin, Greek, the classical French or German authors, English literary criticism, mediæval and early modern history, abstract economics, and the like, realizes that these subjects have for him a purely intellectual interest and bear no vital relation to the life he will lead after graduation. Toward the sciences taught as elementary subjects his attitude is more favorable, but even there the absence of connection with the real world is felt. In brief, the colleges offer studies of a purely intellectual character which certainly ought to command respect, but which certainly do not do so. The student is not literary-minded, and it is idle to criticise him harshly for being what his family and business and social interests make him, and needless to wonder at his devoting himself to such interests as seem to him alive and real. Under such circumstances, one may be allowed to doubt whether the sole remedy urged by the *Nation* year in and year out—namely, the exaction of more work and the imposition of severer examinations—would prove efficacious. Modern American men are not likely to be made scholarly by having general culture rammed down their throats. The students would undoubtedly work enough harder to ensure their remaining in the college, but they would continue to consider "college life" as their real aim. The problem is not to be solved so simply, but rather by a searching study of the nature and opportunities of the college, as suggested by President Wilson in his recent Phi Beta Kappa address at Cambridge.

An experiment which the writer would be glad to see attempted would be the effort by a college to meet the situation squarely as it exists. Taking the future business man, it might say to him: "We will fit you to live in the world of to-day, not by teaching you literary culture nor the rudiments of original research on one hand, nor typewriting and bookkeeping on the other, but by making you acquainted with the actual problems—economic, political, scientific, philosophical, psychological—which every citizen is bound to confront. We will do this by prescribing courses in these subjects as thorough-going as those in any school of engineering or law. If you wish Latin or Greek or Anglo-Saxon or the history of mediæval Italy or the analysis of the Elizabethan literature, you may study these subjects here as electives or, better, at some university. This college prepares for the living world." An institution with such a programme, cutting loose from the English tradition of classical culture or the German tradition of technical scholarship, might prove to be the means of elevating American citizenship.

T. C. Smith.

Georgeville, Canada, August 9.

[The exaction of more work has not been proposed by the *Nation* as a panacea. The problem is to make culture real, not to throw it away because it is sometimes presented in an unreal fashion. And the first, but not the last, step toward reality is honest work.—Ed. The Nation.]

EVOLUTION.

To the Editor of The Nation:

Sir: That errors and defects may exist in the theory of evolution, and in Darwin's own contribution to it, as "A Subscriber" asserts in your issue of August 6, is only natural to believe. It is hardly fair to expect that a radical innovation in human thought, which reversed or overthrew many previous conceptions, should spring into existence full-grown and perfect. But even if Darwin's theories were entirely discredited, the evolutionary hypothesis would doubtless still remain in some form or other.

A common misconception of evolution seems to identify it with progress, with continuous betterment. It is constantly forgotten that evolution is counterbalanced by dissolution; that growth is followed by decay. But it is impossible to demonstrate that the total of things is developing into a harmonious whole that passes, as Tennyson would have the soul pass, "from state to state," ever higher and more perfect. Rather is evolution to be considered as the development of separate existences, remote from each other in time and space, which, so far as we know, form no aggregate, slowly progressing under some super-evolution. Lower forms do change into higher (as well as higher into lower); but there is visible no gradual infinite progression of *all* lower forms simultaneously into higher. Nor is there evidence that any given set of forms has possibilities of unlimited development. When the solar system comes to an end, as it seems it must come, the race of men or even of supermen will not have left any contribution to the hierarchy of archangels whose existence Mr. Bernard Shaw poetically imagines as a future possibility in direct line from the amœba. This particular series of evolutions will have come to an end. Simultaneously perhaps myriads of other evolutions and dissolutions are going on, with no more permanent results.

Evolution attempts to deal only with the world of change, of the fleeting phenomena of mind and matter, and not with the First Cause from which they proceed. It is no more essential for evolutionary theory to explain this First Cause than it is for physical or biological theory to do so. They all deal with the knowable and concrete, and their validity can not be judged by their supposed relations to some thing or being whose very existence we can not conceive in terms of human reason. One philosopher's idea of a tragedy was a deduction killed by a fact; but there will probably be no fatal results in the attempt to reverse the process and kill a fairly well established scientific hypothesis by stating its supposed relation to something entirely beyond our ken.

Ward Shepard.

Cambridge, Mass., August 10.

THE HYPNEROTOMACHIA.

To the Editor of The Nation:

Sir: Inasmuch as the recently published letters by Mr. John La Farge and by Mr. Gardner C. Teal are likely to awaken interest in the once-forgotten "Hypnerotomachia Poliphili" of Fra Francesco Colonna, it may be worth the while to supply your readers with a few bibliographical data.

(1.) The sixteenth-century English translation of the "Hypnerotomachia," 1592, was edited in 1890, by Andrew Lang, in the Tudor Library. This translation is apparently a much rarer book than the Italian original, 1499; at least, I infer from Mr. Lang's introduction that the only complete copy is one in the Bodelian.

(2.) Facsimiles of the woodcuts of the original Italian edition were published in 1889, by J. W. Appell, Ph.D., assistant keeper in the South Kensington, under the title: "The Dream of Poliphilus: Facsimiles of One Hundred and Sixty-Eight Woodcuts etc. Reproduced for the Department of Science and Art in Photo-Lithography," by W. Griggs, 1889.

(3.) The entire 1499 volume was reprinted in facsimile, in 1904, by Methuen & Co. This reprint is without a word of introduction or explanation.

The price of the Appell volume was twelve shillings, sixpence. The Methuen reprint was issued at about two guineas. Mr. Teal says that he picked up his copy in London for less than a pound; he was lucky.

Mr. Lang's introduction is in his wonted style, readable but lacking in precision. His chief reliance is upon Claude Popelin's "Le Songe de Poliphile," two volumes, 1880-1883. Dr. Appell's introduction, though brief, gives pretty much all the information one needs. Especially helpful are his explanations of the woodcuts.

I should add that the reader ought to have the *Athenæum* review of the Methuen reprint, December 31, 1904, pp. 896-7, with Mr. W. C. F. Anderson's letter, *Athenæum*, January 25, 1905, p. 85. Here one's attention is called to the fact that in the original Italian edition of 1499 the date and place of issue are given *in the colophon* as Treviso, 1467 (!), but in the final errata page: "Venetiis Mense decembri. M.ID. in ædibus Aldi Manutii, accuratissime." The explanation is that the work was composed in 1467 at Treviso.

In conclusion, Mr. La Farge's enthusiasm is borne out by Dr. Appell's sober judgment:

But if the Dream of Poliphilus displays little or no merit as a romance, it nevertheless is a work full of curious details for the architect and suggestions for the ornamentist; and it is also of great interest as an evidence of the current of thought and feeling in Italy during the fifteenth century. J. M. HART.

Cornell University, August 18.

MEREDITH'S LETTERS.

TO THE EDITOR OF THE NATION:

SIR: Supplementing the announcement recently made in England and widely copied here that a collection of Mr. George Meredith's letters is in preparation under the supervision of Lord Morley, Mr. William Meredith desires me to ask that any American correspondents possessing letters, who may kindly be willing to place them in his hands, will forward them to me at this address, where careful copies will be made at once and forwarded to Mr. Meredith, the originals being returned immediately to their owners without the delay of transmission to England. E. L. BURLINGAME.

Scribner's Magazine, No. 153 Fifth Avenue, New York, August 19.

Notes.

Aleyn Lyell Reade is publishing a series of privately printed volumes, to be called "Johnsonian Gleanings." His purpose is to deal with the less-known aspects of Johnson's life. Part I is now almost ready for publication.

Henry Holt & Co. have ready for publication "Hellas and Hesperia, or The Vitality of Greek Studies in America," being three lectures by Professors Gildersleeve and Francis White.

Thomas Whittaker publishes "The Motor Boat," translated by Theodore E. Schulz from the text of W. Hantzschel. Besides descriptive matter it contains a disintegrable model of the boat for self-instruction and for use in technical schools.

M. Vicaire, a librarian of the Palais Mazarin, has been appointed custodian of the Balzac collection bequeathed by M. Spoelberch de Lovenjoul. The collection is to be kept at Chantilly, in the old convent of the Sœurs de Saint-Joseph de Cluny.

Some time this autumn Gilbert K. Chesterton will publish, with John Lane Company, a life of Bernard Shaw, under the title of an "Illustrated Biography." It ought to be, in view of the relations between author and subject, hugely merry reading.

The Macmillan Company announces the following volumes to be issued this autumn: "A Life for a Life," by Robert Herrick; "Martin Eden," by Jack London; "Stradella," by Marion Crawford; "A Gentle Knight of Old Brandenburg," by Charles Major; "The Backwoodsmen," by C. G. D. Roberts; "The Human Cobweb," by Putnam Weale; "Discoveries and Adventures in Tibet," by Sven Hedin; "Labrador," by Dr. W. T. Grenfell; "Mexico," by W. E. Carson; "The New New York," by J. C. Van Dyke, illustrated by Joseph Pennell; "The Wayfarer in New York"; "The Picturesque Hudson," by Clifton Johnson; "One Day and Another," by E. V. Lucas; "Daniel Boone and the Wilderness Road," by H. A. Bruce; "My Day: Reminiscences of a Long Life," by Mrs. R. A. Pryor. Also, a new novel by Winston Churchill and another by Zona Gale; a volume on contemporary novelists, by Professor Phelps; a narrative, by Prof. Frederick Paxson, of the conquest of America's last frontier; a volume of essays by J. R. Rhodes, and other works of sociology, economics, religion, science, and philosophy.

The autumn publications of Charles Scribner's Sons include the following titles: "John Marvel, Assistant," by T. N. Page; "The Arabian Nights," edited by K. D. Wiggin and N. A. Smith; "Posson Jone' and Père Raphaël," by G. W. Cable; "Stevenson's Child's Garden of Verses"; "Home Letters of General Sherman," edited by M. A. DeW. Howe; "The Relations of the United States with Spain," by Rear-Admiral F. E. Chadwick; "The Birth of Modern Italy," by J. W. Mario; "The Servian People," by Prince Lazarovich-Hrebelïanovich; "Society and Politics in Ancient Rome: Essays and Sketches," by Prof. F. F. Abbott; "The Universities of Ancient Greece," by J. W. H. Walden; "Narratives of New Netherland," edited by Dr. J. F. Jameson; "Recollections of a Long Life," by Lord Broughton; "Pepys," by Percy Lubbock; "The Return of the Bourbons, 1814-1815," translated from the French of Gilbert Stenger by Mrs. R. Stawell; "The Letters of Percy Bysshe Shelley," collected and edited by Roger Ingpen; "A Rose of Savoy: Marie Adelaide of Savoy, Duchesse de Bourgogne, Mother of Louis XV," by H. N. Williams; "Memoirs of the Duchess of Dino," edited by Princess Radziwill née Castellane; "The Gateway to the Sahara," by C. W. Furlong; "American Prose Masters," by W. C. Brownell; "The Mystery of Edueation and Other Academic Performances," by Barrett Wendell; "The French Renaissance in England," by Sidney Lee; "The White Bees and Other Poems," by Henry van Dyke; "How to Be Happy Though Civil," by Rev. E. J. Hardy; "The American of the Future and Other Essays," by Brander Matthews; "Sixty Years with the Bible," by W. N. Clarke; "Privilege and Democracy in America," by F. C. Howe; "Forty Minutes Late, and Other Stories," by F. H. Smith; "Mr. Justice Raffles," by E. W. Hornung; a new volume of stories by Richard Harding Davis; "True Tilda," by A. T. Quiller-Couch; "Sea Breezes," by W. W. Jacobs; "A Romance of the Nursery," by L. A. Harker; "Church Unity," by C. A. Briggs; "The Problem of Human Life," by Randolph Eucken; "The Boy's Catlin," by George Catlin, edited by M. G. Humphreys; "College Years," by R. D. Paine; "On the Old Kearsarge," by C. T. Brady; "The Boy Pioneers," by Dan Beard, and "The Story of Rustem and Other Persian Hero Tales from Firdusi," by E. D. Renninger.

We take pleasure in calling attention to Thomas Mosher's dainty print of Browning's "Rabbi ben Ezra." It is preceded by the "Prospiee" and followed by the "Epilogue."

With unflagging zest we have gone through, actual reading not sampling, the anthology in prose and verse gathered by Helen and Lewis Melville, under the title of "London's Lure" (The Macmillan Co.). The subjeet lends a kind of unity in variety to the thoughts of many men, and the whole answers to the somewhat confused impression left by the eity on the mind of a visitor. We commend the little book for its excellent entertainment.

As a piece of magnifieent book-making, the two-volume quarto edition of Spenser's "Faerie Queene," printed at the Cambridge University Press, and sold by G. P. Putnam's Sons, takes precedence of anything we have handled for some time. The edition is limited to 350 copies, and the type has been distributed. The text is a literal reproduction (with modern *s* and *r*, and a few obvious misprints corrected) of the edition of 1596 in two volumes quarto. The fragment of Book vii is from the folio of 1609; the letter to Sir Walter Raleigh and the verses addressed to and from Spenser are from the edition of 1590. The accuracy of the text it is safe to assume knowing the nature of the work turned out by the Cambridge University Press. In general the writer of this note sees no profit in the reproduction of the Elizabethan spelling. Why, he would ask, should any pedantic barrier be placed between the meaning of Shakespeare or Sidney and the mind of the ordinary reader? But in the case of Spenser there is a difference. Here the language is a more or less artificial creation of the poet's, depending in part for its savor on the quaint form of the words. The editors of the present edition, as were their predecessors, are wise in not attempting to straighten out or modernize Spenser's strange orthoepy. As for the form of these two volumes, it must be acknowledged that their size and weight make them impossible for holding in the hand. But on a book rest, these clean handsome pages would be a lure to follow the winding track of the faerie crew through forest and meadow, by stream and lake, into aery palace and loathsome dungeon. Spenser is called the poets' poet, and the saying, we fear, is an excuse for all but poets to let him alone. The luxurious few who can read him in this new edition may have occasion to learn more perfectly the magic and insubstantial beauties of his world. No poem of England begins with more winsome romance:

A Gentle Knight was pricking on the plaine;

none ends in a graver ecstasy:

O! that great Sabbaoth God, grant me that Sabaoths sight.

And between these limits what a long journey of ever-changing entertainment.

"The Oxford English Dictionary," with its latest double section prepared by Henry Bradley, enters upon the letter S and proceeds to Sauce, recording 3,886 words—3,557 more than are found in the corresponding portion of Johnson. But what could the insular lexicographer know of the East Indian sabdariffa, good for cooling drinks; of the Cuban wood, sabieu, excellent for hardness; of the Russian antelope, salga; of the evergreen shrub known in the Chinook jargon as salal; of the Canadian saskatoon, combining the luscious virtues of currant and bilberry; or of the West African sassy, an efficient decoction for detecting witchcraft? Such stuff is English made of. Even "sashy" or "sashay," a humorous corruption of *chassé* introduced by O. W. Holmes in "Elsie Venner," is admitted by

our courteous host of words into the sacred precincts; and though the word now stands marked "U. S. vulgar," it has acquired a kind of function of its own, and may yet make its way among its betters. Speaking of Americanisms, we note by the way that "sauce-man" is marked "U. S." and defined as "one who deals in vegetables." "U. S." is a large place, and may no doubt contain some obscure sauce-men vending vegetables, but the present reviewer, who has bought divers kinds of garden products on both coasts and at several intermediate points from dealers of various nationalities, has never met a sauce-man, and knows of no one else who has. Lest some humorous Briton, building on this dictionary, dilate foolishly upon the curiosities of the American dialect, it were well that such provincialisms should be labelled with the name of the particular locality to which they belong.

As the editor points out, this section contains no long articles and comparatively few words showing an interesting sense-development. "Sake" is an exception with a curious history. In the Anglo-Saxon times it meant for the most part something unpleasant—a lawsuit, strife contention. The Hell-fiend Grendel in "Beowulf" wreaked his hate on Hrothgar in constant "sake" (*saece*). In the fourteenth century "Harrowing of Hell" "withouten sake" means "without cause." In the "Cursor Mundi," 1300, the word approaches the modern use, but with an odd difference, in the assertion that Herod "For crist sake the childer slogh." Unless we bear in mind this neutral signification of the word in reading Genesis iii, 17—"Unto Adam he said, . . . cursed is the ground for thy sake"—we shall make God himself the author of a very bitter paradox. It is a strange pilgrimage this little symbol has made from the place where it stood for wrath to the breathless place at the end of a Christian prayer. On the other hand, there is a large group of words in this section which illustrates the strong Rochefoucauldian tendency of the popular mind. The plebeian and democratic soul hears of supreme virtues with a confidently skeptical inward grin. In the pious Middle Ages one could aspire no higher than to the praise of "saintliness"; nowadays the word has lost most of its desirable lustre—we rather avoid that sort of person. More marked is the degeneration of "sanctimonious"; in the sixteenth century it ordinarily suggested perfect holiness; in the twentieth, it ordinarily suggests perfect Pecksniff. "Sacrifice" is another fallen word; of old, it meant something on the altar; to-day it means something on the bargain counter. "Sapient," too, has sunk; formerly it was applied to the Ruler of the Universe; in this age it would almost offend a Solon from Oklahoma, or a Senator from Illinois. Deepest of all has been the degradation of "sanctum sanctorum"; in the elder time it was the word for the "Holy of Holies" in the Jewish tabernacle; now it is the word for the inaccessible office of a journalist.—*Deposuit potentes de sede, et exaltavit humiles!*

Baron de Belabre, for some years French consul at Rhodes, spent part of his time on that island in studying the fortifications and palaces of the Knights of St. John. The result is a scholarly publication ("Rhodes of the Knights"; New York: Henry Frowde), in which he gives, not a new history of the Order of St. John, but a most careful description of those monuments of the knights which still exist in Rhodes, with glimpses of the social and military life of their builders. The treatment is in the main topographical, but, perforce, historical too. The author is master of all that has been written on the subject, and surpasses his predecessors in his diligent study of the remains at first-hand. He conducts his reader successively about the various walls, the Grand Master's Palace, the *auberges* of the different countries, the hospital, the town, and the remains outside the walls. He intersperses anecdotes agreeably, and much interesting information, such as the fact that the present Rhodian Jews are descendants of those who inhabited the city in the days of the knights, and that they still speak Spanish. Most of the photographs with which the book is illustrated are unique, and were taken from places to which access is usually denied.

Students of political science will welcome Walter F. Dodd's "Government of the District of Columbia" (Washington: John Byrne & Co.), while regretting that the work should not have been shorn of some of its crudities. Mr. Dodd has apparently thought it incumbent upon him to pack his book as full of information as possible, with the result, especially in the chapters devoted to the work of the various administrative bureaus, that many pages in the aggregate are filled with minor details having nothing to do with government and of interest only to an official. Detailed recital of the routine duties of a fireman or policeman, for example, presents absolutely nothing that is not common to every sizable community in the country, and is entirely out of place in a work which claims to be a work of scholarship. Equally useless and extraneous are the elementary disquisitions on duty, morals, and reform with which a number of the chapters are prefaced. Those who are likely to resort most to the book may be presumed to know that "it is the duty of every man to take care of himself and to provide for his family," and that "defective plumbing is one of the most frequent causes of disease." With these exceptions, the task of research has been carefully and thoroughly done, and the narrative, if dry and unadorned beyond that of most monographs, is at least clear and orderly.

Benjamin Franklin, one hundred and sixteen years ago, published his conviction that in the centre of the earth all substances would be converted into gas, or, as he called it, air, if temperature went on increasing towards the centre. This theory is probably correct, says Mr. R. D. Oldham in the *Geographical Journal* for August. He shows by a comparison of the rates of travel of the earthquake tremors and waves, as recorded by the various seismographs in different parts of the world, that "in the centre of the earth, extending certainly to not more than half, and, very likely, not to more than four-tenths of the radius, there is material which behaves very differently from that which lies outside of it. In this central core the rate of travel of the first preliminary tremor is checked and reduced by about one-tenth, while the waves of the second phase are either stopped altogether or propagated but feebly, with their rate of travel reduced by one-half." Evidently the suffragettes have been successful in Ghat in the meeting-place of the Saharan caravans, for the Governor, Jamy Bey, says that "tyrannized over by their wives, the poor men have no liberty. This is by reason of the laws of inheritance by which all the real estate is the property of the women." The border region between the Uganda Protectorate and the Congo State is described by Major R. G. T. Bright, the chief of the Boundary Commission. Of the pygmies he says that though both sexes are completely nude, the standard of morality is high, and, "strange to say, they are remarkably intelligent." Some elaborate observations on "dew-ponds" are contributed by Mr. E. A. Martin, F.G.S. The maps are of the Ruwenzori region and northwest Rhodesia.

With "Meditazioni filosofiche inedite di Vincenzo Gioberti" (Barbèra, Florence) and "Vincenzo Gioberti, frammenti inediti" (Bocca, Turin), Edmondo Solmi has begun the publication of selections from the Gioberti manuscripts, now in the Biblioteca civica of Turin. The "Meditazioni" is made up of youthful essays, written before 1825, while the other volume includes "La teorica della mente umana," "Rosmini e i Rosminiani," and "La libertà cattolica," some of the latest unpublished writings of this precursor of the Modernist movement.

In preparation for the coming centenary of the University of Berlin, Prof. Erich Schmidt, for over twenty years a member of the Berlin faculty, has been elected rector of the university for the period 1909-10. Professor Schmidt came to Berlin in 1887 as the successor of Wilhelm Scherer, and has enjoyed exceptional popularity, not merely as the discoverer of the Goethe "Urfaust," but as a man of science devoid of the cobwebs and must of tradition. His wide acquaintance with foreigners, especially perhaps Americans, English, and French, should contribute to his arduous work of arranging for one of the most notable dates in the history of Berlin.

Samuel A. Clarke, eighty-two years old, for many years librarian in the General Land Office and Department of the Interior, Washington, died at Salem, Ore., August 20. He was for a long time editor of the Portland *Oregonian* and published several historical works dealing with the State.

George Cabot Lodge, son and private secretary of United States Senator Henry Cabot Lodge, died on Sunday at the age of thirty-five. He served in the navy throughout the Spanish-American war as an ensign. Shortly after the termination of hostilities he became his father's secretary. Mr. Lodge was the author of a drama, "Cain," and of several volumes of verse: "Song of the Wave" (1898), "Poems" (1902), and "The Great Adventure" (1905).

From London comes the report of the death of Sir Theodore Martin, the well-known translator of Heine, Goethe, Dante, Horace, and Virgil. He was born in Edinburgh in 1816, and was the dean of English writers and parliamentary agents. Be-

sides his translations he wrote several biographies, the chief of which was the "Life of the Prince Consort," in five volumes, which was composed in collaboration with Queen Victoria.

The death is announced, in his seventy-third year, of Adolf Hausrath, professor of ecclesiastical history in the University of Heidelberg. Among his publications are "Konrad von Marburg," "Apostel Paulus," "Neutestamentliche Zeitgeschichte," "David Fr. Strauss und die Theologie seiner Zeit," "Luthers Leben," and several romances.

Another death, that of Adalbert Merx, the Orientalist, has occurred in the faculty of Heidelberg. Prof. Merx was seventy-one years old and had been at the university since 1875. He had published a long list of Biblical and Oriental studies, including "Die canonischen Evangelien nach ihrem ältesten Texte."

ROMAN LETTERS.

A Literary History of Rome, from the Origins to the Close of the Golden Age. By J. Wight Duff, M.A., Professor of Classics, Armstrong College (in the University of Durham), Newcastle-upon-Tyne. New York: Charles Scribner's Sons. 695 pages. $4.00.

This history, or, rather, partial history, of Roman literature forms the tenth volume in Mr. Fisher Unwin's "Library of Literary History." This fact may suggest its general plan, and also explain its incompleteness—for the history of Roman literature is a longer story than some of the similar histories already issued in the series, say, for Ireland, Scotland, or America. Perhaps it is the publisher's intention to devote two volumes to Rome, as has been done for the literature of Persia. In that case, we hope that the second part may be assigned to as capable hands as the first.

Professor Duff's book is a good, scholarly piece of work. It is written professedly for the general reader, but even the professional student of Latin may read it with much pleasure and profit. Throughout the volume he insists upon the permanence of the Roman type, and wisely emphasizes the national aspects of the literature; for "the Roman borrowed in a Roman way." His critical judgments are usually sound and well expressed, and one gets the pleasant impression that they are based on his own reading of all the authors concerned.

The volume begins with a long introduction, of 57 pages, on the descent of the Romans, their language, character, and religion. This is an attempt to set forth the complex heredity of the people and their literature, and to discuss some of the "determining facts of existence which constituted the Roman environment." Here the author grapples with some difficult questions, such as the relationship of the Italic tribes, the influence of the Italic dialects upon Latin, and the characteristics of plebeian Latin. It is hardly his fault that some of his results are rather hazy or uncertain—"linguistic connection does not settle racial connection." And after all that has been learned, or guessed, in much philological and epigraphical research, some of his linguistic questions must still wait for the accumulation of more evidence.

The history proper is divided into two main periods: the earlier literature of the Republic (from the origins to 70 B. C.) and the literature of the Golden Age, the second period being subdivided into the Ciceronian age (70 B. C. to 43 B. C.) and the Augustan age (43 B. C. to 14 A. D.). The sketches of Ennius, Plautus, Varro, and Cicero are all good, and, as is apt to happen in an English book, the chapter on Virgil is excellent. For the beauty of Virgil's style still appeals to the best English scholars:

> But it is to beauty that, like Dante, one returns as the final fact and feature of his style. Under Virgil's verbal sorcery, Latin becomes a golden language of exquisite richness, veined with a delicate melancholy and wistful reverie upon the abundant travail of life. If his wealth of tremulous pities and mystic dreams do not make true poetry, then poetry was never written.

The illustrative passages which are introduced to support the author's criticisms are given in English translations, with the Latin relegated to notes. And the translations are always good. Witness the teeth-chattering of the half-drowned Labrax (Plautus, "Rudens," 533):

> If I only had luck to be a du-duck,
> So that all the wa-water would leave my back dry!
>
> Utinam fortuna nunc anetina ut-uterer,
> Ut, quom exissem ex aqu-aqu-aqua, ararerem tamen!

Horace's adventure with the bore is translated in prose as a dramatic sketch, and the two universal favorites, "Pæne insularum, Sirmio" and "O Fons Bandusiæ," are cleverly turned into sonnets.

Sometimes the reader is treated to a modern instance. On p. 244 we are told that Horace's imitations of Lucilius, to compare great things with small, are "like Max O'Rell's copying, in 'L'Ami Macdonald,' of Dean Ramsay's Scottish stories." The atomic theory expounded by Lucretius "is still for scientific thought its basic hypothesis. Even in the light of the flashes of the spintharíscope which mark the off-shooting of helium atoms from radium, it is not more than a modification of nomenclature that is necessary" (p. 289). And on p. 608 we are assured that Ovid really deserves more handsome commendation than Quintilian's, "which is the exact counterpart of the fabled curate's remark on an unsatisfactory egg—*laudandus tamen in partibus.*" But the most striking parallel in the volume is the comparison of Lucretius and his comprehensive love of nature with Whitman:

> Both rationalist, though Whitman is less systematic; both at times prosaic and careless of form, though Whitman is exeessively so; both frankly approaching all processes of life in their naked simplicity; both perhaps seeking, though Whitman more evidently, for some ideal essence behind things, they are in nothing more alike than in their sense of the open and delight in the free growth that is in nature. Lucretius, it is true, looks on the scheme of things with something of the enjoyment felt by the spectator of a great tragedy. He feels both *horror* and *uoluptas*. But if he has not Whitman's violent dithyrambic raptures over each throb of universal nature, his love is not less real because more restrained.

The parallel is resolutely drawn, but it requires too many "thoughs."

Professor Duff escapes the charge of insularity which has sometimes been brought against his countrymen, by showing a wide acquaintance with the work of German, French, and American scholars. His decisions on disputed questions will, of course, not satisfy everybody, but he is always scrupulously fair and courteous. He is surely right in rejecting the contention of Bährens that the "Albius" of Horace is not the poet Tibullus. And he is as surely wrong in accepting Skutsch's reckless guessing as to Virgil's indebtedness to Cornelius Gallus in the sixth and tenth Eclogues.

One or two other details may be mentioned here. It is hardly worth saying (p. 90) that the Fescennine masque was the lineal ancestor of pastoral amœbean verses like those in Virgil's Eclogues, without adding that Virgil had a very definite model for his amœbean lines in the Idyls of Theocritus. And one who is very jealous for Virgil may fairly protest against the statement (p. 441) that "Ecl. viii, 58, *omnia uel medium fiant mare*, is a blunder for πάντα δ'ἔναλλα γένοιτο." The general model of the passage is doubtless Theocritus, but the details are changed, and it can hardly be called a translation at all. On p. 281 we are told that Lucretius's invocation to Venus "may have been suggested by the fact that Memmius was son-in-law to Sulia, who was devoted to the goddess." This may be new, but it is not very convincing. And it scarcely harmonizes with the statement (p. 295) that the Venus of the invocation is "a reminiscence of the Aphrodite of Empedocles."

The book is well printed, on good paper, and the proof-reading has been very carefully done. "Though" for "thou," p. 541, l. 25, is a rather lonely error. And if "Mevius is the better spelling" for the enemy of Horace and Virgil, p. 615, the "Mævius" of pp. 273, 480, 505 might be changed.

CURRENT FICTION.

The Hungry Heart. By David Graham Phillips. New York: D. Appleton & Co.

If Mr. Phillips, with his fondness for exposing the weaknesses of polite society, has always a good deal about him of the bull in the china shop, there is no doubting his sincerity or denying his vigor. He is a voice of the Middle West; he speaks, without conscious pose, as a plain man of the people, which is to say, the people of the class and district from which he came. There is a something impressive as well as comic in his insistent expression of a conviction that the East is really little better than the home of effeteness and affectation. We recall how, but recently, "Joshua Craig" made ravage upon the Atlantic seaboard, bringing to confusion all persons who were so luckless as to have been bred or educated according to the fair, false Eastern method. The present hero's mid-Westernism is less rampant than Joshua's, but, despite his respect for his grandfather, his cultivation, and his "long, aristocratic face," he is plainly differentiated in his creator's mind from the Basil Gallatin, whose artificiality and spinelessness proclaim him from the East.

The story belongs to the general order of "The Helpmate" and "Together." That is, it is a study of modern married life, and begins where the old-fashioned novel used to end. Courtney Vaughan is a woman whose mind has survived social and college training. She has married with a high ideal of love, but shortly after her brief honeymoon discovers that her husband cares only for her physical charm, and has not the least notion of making an intellectual companion of her. He has the old conception of a wife as a housekeeper and plaything. She is not content, and falls into the hands of Gallatin, whose love for her, she thinks, is of a more exalted kind. In time this illusion is destroyed. She sees him for a weakling; but clings to the poor shadow of their love, as all that is left for her. Then the crash comes; the husband discovers the situation. Here the unexpected begins to happen. Vaughan, who up to this time has seemed a man of singularly narrow and dull apprehension, develops sudden intelligence and magnanimity. He offers Courtney her freedom, and even her child.

Mr. Phillips has acquired a considerable popular reputation as a man who tells the truth as he sees it. In fact, his method unites realism and didacticism in such proportions as naturally to command, in his treatment of problems of sex, a large, if feminine, audience. "The Hungry Heart" is a vigorous tract. Basil Gallatin is a fair type of the invertebrate philanderer. Richard Vaughan is, if you take him literally, rather absurd. His character is not developed: suddenly, at the proper time, he ceases to be one person and becomes another, by a process of conversion as violent and conventional as that of brother Oliver in "As You Like It." On the other hand, we may record with pleasure the impression that in Courtney Vaughan, with all her inconsistencies and failings, Mr. Phillips has come nearer the creation of a living human person than ever before.

Kingsmead. By Bettina von Hutten. New York. Dodd, Mead & Co.

This is another of the Baroness von Hutten's sequels. Here again (though receding into the background) Pam figures, here the Brigit Mead, who loved a great violinist and became Lady Pontefract, here the Tommy who appeared incidentally as Brigit's brother in "The Halo." Here, finally, one may see Pam's daughter Pammy steadily edging toward the foreground, a large and greeuy young girl, who, we are told, is going to be good-looking some day. Obviously, she is to be the next heroine in the series. Meantime, Tommy, Lord Kingsmead, holds the floor, and for heroine we are forced to put up with an adventuress of whom, presumably, we shall hear nothing more. She is, to tell the truth, rather preposterous: a shy, large-eyed damsel, who always carries a silver mirror (whereby hangs a tale) and wears mignonette. She passes for a widow, but damsel she is, and with a past. Tommy's bosom friend loves her, and Tommy does his best to marry them. But when it is almost too late, he discovers at the same moment, that he himself loves her and that she is a fraud. Her past turns out to be lamentable—she tells Tommy all about it and she loves Tommy; but she still proposes to marry the friend. Tommy prevents this, and will have none of her himself. The curtain falls upon the "Mignonette Lady," leaving her silver mirror in Tommy's hand, for remembrance, and rather piteously taking herself out of his life. If it were not for her persistent designs upon the bosom friend, and her attempts to get Tommy to keep her story from him, we should find it possible to pity her more, and we should incline to despise Tommy for his squeamishness. As matters stand, we assent that he and the bosom friend are well rid of her. We suspect that Pammy's forthcoming love-story will be not unconnected with Tommy's sober second thought.

The tale is told with that air of light-hearted inconsequence which gives this popular novelist her charm. She acknowledges in a brief and good-humored preface the discrepancies which "the nimble critic" may find in her "Pam" series of novels. Witnout especial nimbleness, one may find incongruities and contradictions in abundance within the bounds of the present story.

A False Position. By Mrs. Baillie Reynolds. New York: Brentano's.

It is a pity that the qualification of a book as suitable reading for a young girl and safe to be admitted into the family circle, should commonly be accepted as a sneer by implication. There is no reason why simple and wholesome themes should be relegated to the hands of incompetence; pathology need not enlist the services of all the expert: but of late, there has arisen somewhat of a cult that holds only the abnormal and diseased worthy of skilled treatment. Mrs. Reynolds's latest book is a pleasant rebuke to this fallacy. Its characters are neither consistently villanous nor consistently heroic, but fallible humans trying for betterment, and if one must admit that they are a bit *bourgeois*, they do not differ in that respect from the majority of readers. Mrs. Reynolds has taken the old but inexhaustible theme that truth is the only safe foundation for every degree of human intimacy, and elaborates it with grace and ingenuity. The tangled threads of the plot are unravelled at the end with a minimum of breakage, and though no single figure may have impressed itself upon the mind as a salient and individual creation, one is left with the comfortable sense of having been amused and interested without a waste of time or an aftermath of unpleasant recollection.

Less Than Kin. By Alice Duer Miller. New York: Henry Holt & Co.

The black sheep of an excellent family in the United States dies obscurely of drink in a South American republic after an absence of several years. On the brink of political imprisonment an exiled countryman of his, handsome, reckless, yet in the main, thoroughly admirable, goes North and presents himself as the returned prodigal. It is an old plot but a new author and a new story. If you can tell what is going to be done or be said from one page to the next, you are more astute than the present reviewer. If you can absent yourself from this two hours' diversion before it is ended, your bump of curiosity must be insignificant—the Ancient Mariner could never have held you like a three-years' child. The story is witty, terse, and swift. For a narrative so light, bent purely at amusement, the characterization is surprisingly sharp and vivacious. In fact, Nellie, the inflexible dogmatic young woman in the case comes pretty near being a very memorable creature. Wherever she appears, the sparks fly. It would be unjust to the reader further

to uncork the novel champagne of her personality. So crisp is the dialogue, so unconventional the action that it will be astonishing if some one of our needy playwrights does not turn "Less Than Kin" into a charming little farce-comedy.

LOUIS XVII.

The King Who Never Reigned: Memoirs upon Louis XVII. Edited, with introduction and notes, by Maurice Vitrac and Arnold Galopin. To which is added Joseph Turquan's New Light upon the Fate of Louis XVII. New York: The John McBride Co. $3.50 net.

The Little Dauphin. By Catherine Welch. New York: Charles Scribner's Sons. $1.50 net.

It is recorded of Lord Beaconsfield that he once said to a young man anxious to shine in society: "Never inquire who the man in the Iron Mask was, or you will be thought a bore." But, notwithstanding the advice of Disraeli, the tragedies of royal houses will always make their appeal. The identity of the masked prisoner, of Gaspard Hauser, and the fate of the son of Louis XVI are questions that will not down permanently. Of late there has been a decided revival of interest, in France and England, in the history of the young Dauphin, who did, or did not, die in the Temple, and several volumes on the subject have appeared recently. Two of these are now before us. One, edited by MM. Vitrac and Galopin, is made up of the Memoirs of Eckard and Naundorff, and "New Light on the Fate of the Dauphin" by Joseph Turquan. Although Eckard's work is old, it is little known, and is extremely important, for his memoirs have really formed the basis for all the researches that followed. He was a perfervid royalist, but admittedly honest, and as he had an opportunity of questioning many of the contemporaries of the Revolution, an opportunity of which he availed himself industriously, he learned from first-hand sources facts which but for him would never have been brought to light. As for Naundorff's Memoirs, there does not appear to be any excuse for publishing them at all. The narrative is a farrago of incongruities and contradictions, of peregrinations, imprisonments in mysterious and unknown places, strange maladies—the whole thing as grotesque as it is incredible. Besides, the absurdities are not even amusing.

M. Turquan's attempt to solve the mystery is interesting, because it presents a new explanation of the drama in the Temple, or, at least, a new dénouement. His thesis is that the unfortunate son of Louis XVI and Marie Antoinette was assassinated within the precincts of his prison, on January 19, 1794, between eight and nine o'clock at night; that he was buried, before life was extinct, in the moat of the Temple; that a child, suffering from an incurable disease, was substituted in his place, and that his sister, the Duchesse d'Angoulême, was made aware of the fact after her return to France, the knowledge of which fully accounts for her strange acts and words in relation to the subject. The theory is based on a passage in the Memoirs of Comte d'Andigné. This royalist chief, when a prisoner in the Temple in 1801, obtained from Fauconnier, the concierge of the Temple, permission for the prisoners to make little gardens of the heaps of earth that had been thrown into their quarters from the moat. Their labors resulted in the discovery of the remains of a child, which had evidently been buried in quicklime at the bottom of the moat. D'Andigné at once rushed to the conclusion that the skeleton was that of the Dauphin. He questioned the concierge, who replied in the affirmative. M. Turquan considers this formal declaration of the jailer of the highest importance. He supports his contention by a chain of arguments, some of which are decidedly ingenious, if not convincing. The Comte d'Andigné was the soul of honor and loyalty, and his sincerity was above suspicion. All which is no doubt correct, but very poor evidence to support the statement of the concierge. This man had filled the post of jailer only since 1798, and could, therefore, have had no personal knowledge on the subject. However, it is on his conjecture that the author has built up a theory. On the 19th of January, 1794, he tells us, Simon strangled his victim, shortly before he left the Temple forever, by order of the Commune and the Committee of Public Safety. M. Turquan is not absolutely certain that Simon acted under official authority in the matter, for the cobbler might possibly have killed the little victim in a fit of drunkenness or brutal passion, at any time before his departure. None of these suppositions is essentially improbable, and any of them would have the advantage of explaining several circumstances which are at present incomprehensible; for instance, Simon's abrupt dismissal from his post, and the laborious care with which at the time everything concerning the Dauphin, including his death, was concealed from his sister. But a conjecture cannot be adopted as true because it is a convenient solution of an enigma and is free from any inherent improbability, nor can it erase from history conclusions that are deduced from official documents, such as jail registers, reports of physicians, etc. This work, like those that have gone before it, will simply have the effect of proving that it is useless to expect any complete revelation of the truth concerning, perhaps, the most poignant episode of the Reign of Terror.

Miss Welch's volume on the same subject is very pleasant reading. It deals with the whole life of the little prince from his cradle, and is marked by freshness and individual judgment. The author is too sane to venture on any positive assertion as to what happened in the Temple in 1794, but she lets it be understood that she is inclined to believe in the escape of the Dauphin. She is certain, however, that every one of the forty persons who at very different epochs posed as the son of Louis XVI was an impostor. Miss Welch has a keen sense of humor, and this adds to the attractiveness of this bright little narrative.

A Vindication of Warren Hastings. By G. W. Hastings. New York: Henry Frowde. $2.

When Warren Hastings returned to England in 1785 he expected some recognition for his great services in India; he found instead that his hateful rival, Sir Philip Francis, had poisoned men's minds against him and that he was to be impeached. Burke's false setting of the Indian situation and the enchantment of Sheridan's oratory worked such prejudice to him that the trial dragged on for seven weary years and cost him the larger part of his fortune.

Even death in 1818 did not end the ill-usage of which Hastings had had so much in life—Macaulay's essay was yet to appear. This essay, like that on Frederick the Great, exhibits a curious inconsistency. The great Whig historian could not help admiring the greatness of his hero, and frequently gives him unmeasured praise. But at the same time, laboring under the spell of Burke and Sheridan, and intoxicated by the exuberance of his own irresponsible rhetoric, he condemns Hastings as guilty of "great crimes," and makes insinuations as to motives which still further blacken his character. This picture of Macaulay's, familiar to hundreds of thousands for half a century, has been somewhat damaged by the careful studies of Sir James Stephens, Strachey, Lyall, Forrest, and Lawson, and is now thoroughly demolished, as accurate biography, by Mr. Hastings's "Vindication." This is in no sense a biography. It does not attempt to give a connected narrative of Hastings's whole life, but merely takes up in detail Macaulay's fictitious insinuations and "great crimes," and examines them critically in the light of the official records. The chief of these records are the three folio volumes, containing the daily minutes of the Council during Hastings's administration, which were published at Calcutta by G. W. Forrest in 1891.

To show the result of this examination, the Nuncoomar affair may be tak-

en as a fair sample. At the time when Sir Philip Francis had the majority in the Governor's Council at Calcutta, and was lending a ready ear to any slander on Hastings, Nuncoomar appeared before the Council to accuse Hastings of accepting a great bribe from the Munny Begum. According to Macaulay, (1) the letter which Nuncoomar offered as evidence was genuine. (2) To rid himself of the charge and to destroy his accuser, Hastings suborned a native to make a counter-accusation against Nuncoomar of obtaining more than a lac of rupees by forging a bond. "The ostensible prosecutor was a native. But it was then, and still is, the opinion of everybody, idiots and biographers excepted, that Hastings was the real mover in the business." (3) Nuncoomar was condemned "before Sir Elijah Impey"; (4) and "no rational man can doubt that Impey condemned him in order to gratify the governor-general. Hastings later described Impey as the man 'to whose support he was at one time indebted for the safety of his fortune, honour, and reputation.' These strong words can refer only to the case of Nuncoomar. It is our deliberate opinion that Impey, sitting as a judge, put a man unjustly to death in order to serve a political purpose." (5) However, Macaulay does not think even the murder of Nuncoomar can be reckoned among Hastings's "crimes," because he was acting for "self-preservation."—Now, what are the historical facts? (1) The letter which Nuncoomar offered as evidence against Hastings was unquestionably a forgery; he was notorious for his dishonesty in other affairs; in his house were found counterfeits of the seals of many princes; he had a grudge against the governor, who had refused to appoint him to a coveted office, and he sought this means to get even with him; he knew that Francis would gladly receive any accusations against Hastings; and it is significant that Francis took care not to put Nuncoomar through any cross-examination as to his allegations. There is therefore not the slightest reason to doubt Hastings's statement that the whole accusation was a malicious forgery. (2) Hastings declared on oath that he had "neither advised nor encouraged the prosecution of Nuncoomar." The court records show that the private action on account of the forged bond was begun *six weeks before* Nuncoomar appeared before the Council, that is, before Hastings would have any motive for suborning a counter-accusation. It is clear that the idiots and biographers were right and the brilliant essayist, who did not stoop to verify his facts, was wrong in regard to this all-important point. (3) The trial was not before Impey alone, but before a bench of four judges. Macaulay overlooked this fact. His insinuation against Impey must be extended to the other three judges—or rejected. (4) The words of Hastings expressing lasting obligations to Impey, which Macaulay rashly accepted as conclusive proof of a dishonorable agreement between the judge and the governor to destroy Nuncoomar, do not refer to this affair at all; they refer to the attempt made by Francis to seize the reins of government some years later on the pretext that Warren Hastings (owing to a resignation handed to the directors in London by his agent, but disavowed by him) was no longer governor. The question was referred to the Supreme Court, where Impey and the other judges decided in favor of Hastings. (5) Macaulay's justification of Hastings has the faintness which damns rather than justifies. How far a judicial murder in self-defence is justifiable is a point in casuistry which it is not proposed to argue. On page after page Macaulay is shown to be equally untrustworthy. And yet the official records from which all these facts appear lay at Calcutta when Macaulay was there.

The author of the "Vindication" speaks as one having authority. His grandfather, a distant cousin of Warren Hastings, was present in Westminster Hall at the impeachment, heard the great speeches, and described the scene in his latest years to the author, then a boy. His father stood in the Sheldonian Theatre at Oxford when Warren Hastings received the degree of D.C.L. at the hands of the university, and lived to refer to that occasion forty years after, when he himself was honored with a similar compliment. The author himself has known personally many men who knew Hastings personally, and he is one of the very few now living who knew Daylesford House, outside and in, as it had been when Warren Hastings was there. Naturally, he writes *con amore*, and often with vehemence, but he keeps within the bounds of good taste, and proves his case. Many of the facts he presents have already been published by Forrest in his edition of the Council Minutes, but not one person in a thousand who reads Macaulay's essay is ever likely to see so much as the backs of Forrest's volumes. Though nothing is ever likely to be written which will have a tithe of Macaulay's audience, this "Vindication," attractive in form with the portraits of Hastings and the pictures of Daylesford, deserves a wide circulation as an antidote to the famous essay.

State Insurance. By F. W. Lewis. Boston: Houghton Mifflin Co. $1.25.

Mr. Lewis, who is a member of the Boston bar, has brought out a useful book. Economic insecurity he regards as a menacing evil; "a slight misfortune—enforced idleness, a serious accident, illness"—may reduce a family to poverty and abject want; and the only remedy is a comprehensive scheme of insurance. Existing institutions—savings banks, "friendly societies," trade-union benefit systems, relief departments of corporations, industrial insurance—in some degree relieve economic insecurity, but fall far short of meeting all demands of the situation. Mr. Lewis, therefore, advocates compulsory State insurance, substantially on the German plan. The German legislation of the eighties and the results achieved under it he briefly describes, without exaggeration or undue praise; and the following chapter, as if by way of contrast, gives an account of the history and working of the fellow-servant doctrine in England and the United States. The cost of insurance, Mr. Lewis thinks, should fall upon the workingmen themselves, and, wherever necessary, wages should be readjusted to the standard of a full living wage, including provision for sickness, accident, and old age. Old age pensions he rightly regards as unsound in theory, since they do not reach the cause of the evil, and are difficult to alter or amend after being once adopted. All pension schemes should be "contributory," and "cannot be made effectually contributory without compulsion."

Altogether, Mr. Lewis has made out a strong case. He does not strengthen it, however, by presenting mere estimates of outlay for poor relief (p. 20), when the census statistics are available; or by using rickety estimates of the distribution of wealth in the United States (p. 15); or by citing unreliable enthusiasts and sensationalists as authorities or "competent observers" (pp. 10, 15, 159).

The Awakening of Turkey. By E. F. Knight. Philadelphia: J. B. Lippincott Co. $3 net.

Mr. Knight calls his book a "history of the Turkish revolution." For such a history, of course, the time is not yet at hand. The most we can hope for at present is a systematic résumé of what the newspapers during the last year have told us, supplemented by such special information as previous acquaintance with Turkey and her people may have placed at a writer's disposal. The leaders of the Turkish liberation movement have been exceptionally gracious in their relations with Western correspondents; but they tell only what may be conveniently told. The greater part of the present volume is, therefore, neither very new nor yet very profound.

Written from a decidedly philo-Turkish point of view, it would have little to say that the friendly Anglo-Saxon press has not already said, had not the

author been fortunate enough to obtain access to the letters and diary of Niazi Bey, who first raised the standard of revolt in Macedonia, a scant three weeks before the collapse of the Hamidian régime. Niazi's diary, or what we get of it here, contains little of first rate import; but it is undoubtedly absorbing to follow in detail the makings of a revolution—the first daring step, the handful of refugees swelling with every day toward the dimensions of an army, and a free-breathing countryside breaking through the pall of despotism like the surface of a slate under the sponge.

Mr. Knight is almost Thucydidean in his minute account of what Niazi did and said during the two weeks of insurrection. He strengthens the existing impression of the extraordinary care and laboriousness with which the ground for revolution was broken and prepared. We may cite a single instance. In one Macedonian village a man in the secrets of the revolution had babbled to his wife, who, in turn, grew over-communicative:

> This event led to the creation of a female police or vigilance committee in this and some other villages, whose chief duty apparently was to check indiscreet gossip concerning the committee.

This is almost Japanese foresight.

Science.

THE PSYCHOLOGY OF HEALING.

Psychotherapy. By Hugo Münsterberg. New York; Moffat, Yard & Co. $2 net.

This book, as we are told in the preface, is one of a series in which the author proposes "to discuss for a wider public the practical applications of modern psychology." A thoroughly scientific discussion of such a subject by a trained psychologist of the author's position and reputation would evidently have an important place in pedagogical literature; but an appeal to the wider public by one who claims to have only the interests of science at heart, as our author constantly does (*e. g.*, p. 240), is scarcely justified, unless the specialists in his field are slower to employ the instrumentalities at their command to the obvious advantage of the people at large.

There is, however, no evidence of such an attitude of mind among the serious psychologists of our day, and it would, therefore, at first sight appear improper to treat this book, and "On the Witness Stand," the preceding one of the series (reviewed in the *Nation*, May 21, 1908), as more than attempts to acquaint the ignorant public with the work of the psychologist and its possible applications to practical life; attempts which are, of course, entirely laudable, but which are not, strictly speaking, scientific. But, as a matter of fact, Prof. Münsterberg here deals with an array of subjects none of which can be properly understood except by the highly educated among the "wider public," and most of which appeal either to the specially educated doctor or to experts in psychiatry, psychology, and philosophy. His book must, therefore, be considered in relation to its effect upon these several classes of readers.

The educated layman, upon perusal of "On the Witness Stand," must have been impressed by the unbounded, and often unwarranted, optimism of the author in relation to the immediate value of the practical application of psychophysical method to the realm of law. In the book before us, this optimism will be less obvious to the average reader, but the specialist cannot fail to note again the author's weakness in this regard. Although scientific advance in any field must eventually affect all other related sciences, this very correllation of the sciences indicates the necessity of caution in treating advances in any special lines as of pre-eminent importance. In fact, little of value is likely to be attained when such attempts are made in appeals to a public which reads to be entertained, not to be instructed. The consequences of such reading may, in fact, be actually evil in relation to mental discipline; for, to use our author's own words (p. 201), "an untrained attention is attracted by everything which is loud and shining, big and amusing. The trouble is not with the rush and hurry of the impressions which demand our attention; the trouble is with our attention, which seeks a quick change of new and ever new impressions, because it is not disciplined to hold firmly to one important interest."

Nevertheless, a number of the author's teachings are of great value to the educated layman among this "wider public," and offer a timely opposition to certain current misconceptions. It is unfortunate, therefore, that the beneficial effect of these teachings is likely to be much reduced, if not altogether lost, because the leaders maintaining the doctrines opposed by our author will doubtless retort that his opinions need not be taken quite seriously; basing their assertion on adverse criticisms which are bound to be made by specialists to whom alone certain parts of the book will be thoroughly comprehensible.

Most important is his discussion of the relation of religion to medicine; in which he argues convincingly that the cures performed under such influences are due to causes only fortuitously religious, emphasizing the fact that a large proportion of the effects produced by the modern religious psychotherapist may be produced equally well by the most barbarous of superstitions (p. 225) and calling attention (pp. 164, 335 f) to certain dangers, which are commonly overlooked, in therapeutic practice connected with religious appeals. He quite properly protests against current references to the "moral factors" in illness; justly holding (p. 56) "that the right entrance to psychotherapy is missed if the difference between morality and mentality is not recognized from the very beginning." He does well, also, to call attention to the artificiality of the separation of functional from structural nervous diseases, of which the modern religious psychotherapists make so much.

With equal propriety he emphasizes the distinction between the attitudes of the physician and the clergyman, and points to certain dangers which are involved in the current neglect of this distinction (*e. g.*, pp. 187, 33). His contention (chap. xii) in favor of a higher view of religion than that which allies it with the elimination of pain, should gain the ear of the thoughtful among the clergy and laity alike; as should, also, his appeal (p. 381 f) in the interest of a nobler view of the world and of God than that which "gains authority over the mind from such an external motive as a belief in its curative effects." "What is gained," he justly asks, "if some nervous disorders are helped by belief, if the belief itself devastates our intellectual culture and brings the masses down to a view of the world which has all the earmarks of barbarism?" So far, his ideas are sound.

When we turn to his treatment of suggestion, of hypnotism, and of the subconscious, we find an unfortunate attempt to speak to two audiences at the same time. The average well-educated layman would have been enlightened by learning that suggestion, as employed by the psychotherapist, is not a mysterious power of one "will" upon another "will," but is merely a special form of an influence which every man exerts upon his fellows in normal life; and that the dangers connected with the use of this special form of suggestion, while real (pp. 106, 226, 383), are no other than those which in milder form may appear in the practice of the unskilled teacher who encourages in his pupil bad volitional habits. He would have been benefited by the knowledge that hypnotism is very closely allied with mental conditions which are agreed to be normal, and that, while its employment by the uneducated should be discouraged, on the other hand its use by the skilled practitioner, with due caution, is no more to be feared or deprecated than is the employment of other radical therapeutic agencies where morbid conditions seem to warrant such use. He

would have found his thought clarified by the teaching that what is spoken of so glibly nowadays as the "subconscious" is not, as it is commonly thought to be, a mysterious inner moral force, especially powerful in producing changes in the nervous system; and that, as thus conceived, no such thing exists.

But, unfortunately, Professor Münsterberg here presents views which are not at all appropriate for the consideration of the layman; which really appeal to the average well educated physician, and which are couched in terms certain to lead the physician to question the validity of the author's statements. And such doubts will be strengthened if the inquirer appeals for verification to skilled psychologists and psychiatrists.

The psychologist, for instance, will tell his inquirer that the word consciousness is commonly employed in two senses, viz., (1) as the equivalent of mere psychic existence, and (2) as the equivalent of "awareness"; and that only if we mean to use the word in the latter sense (*cf.* p. 133) is it true that "there is no subconsciousness" (p. 125-157), *i. e.*, no awareness of which we are not aware. But the psychologist will also tell his enquirer that we have very good reason to believe that there is a form of mental life transcending the narrow limits of awareness (what H. R. Marshall would have us call sub-attentive consciousness), and that it is this "sub-attentive consciousness" which is usually referred to by serious students who use the unfortunate term "subconscious."

We are thus brought to the consideration of the effect of the book upon experts in the several fields in which the writer claims to speak as himself an expert. The opening up of the field of scientific psychotherapeutic treatment is so recent, and the exploration of the field so manifestly inadequate, that it behooves the really scientific worker to record his observations in a form which his co-workers may examine and verify; or if this is impossible, to state his own views with more modesty than our author displays and to hold them more tentatively. It is reasonably sure that practical psychotherapists will find their experience differing in some respects from that of Professor Münsterberg in regard to alcoholic and morphine patients; and certainly the psychiatrists will fail to follow him in his quite artificial restriction of psychotherapeutic treatment to cases outside the alienist's field of work, which implies a sharp distinction between the sane and insane, such as few leaders in psychiatry would to-day defend.

But, after all, our author, notwithstanding his desire to be numbered with the physicians, will be judged primarily as a psychologist. We may make due allowance for carelessness in writing under pressure to meet a present popular demand; but it is under just such unguarded conditions that a man is likely to lay bare the real nature of the doctrines which guide his thought; and it is clear that in the case of our author these doctrines were derived in the receptive age of youth, and have remained virtually unmodified to meet modern criticism. His reference to "the will" is constantly made (*e. g.*, p. 31) in terms that hark back to the conception of the "faculty psychologists," which should have succumbed to Locke's forceful attack, but which actually held almost complete sway among the psychologists of our author's youth. The opening chapters might well have been written by a psychologist of the early associationist school; although few even of them would have been bold enough to hold with our author (p. 24) that "the whole stream of mental life" is "made up of sensations," "we ourselves" being "for ourselves a complex combination of sensations" (p. 25). In fact, he actually proclaims (p. 23) that "if there were mental states which are composed of other elements than sensations, they would necessarily remain indescribable." His reason for this questionable statement, viz., that "we could not grasp them because they would not have any definite relation to the common physical world," is in line with a view of his own to which he attaches great importance, that "as soon as we look on inner life as merely psychological objects, then the material is connected only through the underlying physiological processes, and we can never explain causally the appearance of an idea through the preceding existence of another idea" (p. 139). In other words, he justifies the important place he gives to physiological psychology by the assertion that without reference to physical process causal relations between psychic states would be inexplicable; an assertion which involves a very doubtful thesis as to the nature of the concept of causality and which carries with it the denial that anything like a valid psychology existed in ancient times when the masters of thought were ignorant of the nature of the psycho-physical process. He properly emphasizes the view, above referred to, that the suggestion employed by the psychotherapist is of the same nature as processes observable in normal life; but he takes a step backward when he separates this psychotherapeutic suggestion from the ordinary emphasis of ideas through every day environmental influences. Few, if any, psychologists will follow him in holding (p. 100) that "it is meaningless to speak of suggesting an idea"; that (p. 101) "suggestions which are not suggestions of action are without exception suggestions of belief."

But, perhaps, we make too much of his psychological positions; for his present interests are philosophical rather than psychological, and, in this particular book, we find not a little of interest in relation to what, broadly speaking, we may call the philosophy of life. His demand that the medical student should be trained in psychology (p. 364) is thoroughly warranted, and timely. His explanation of the basis of the crude metaphysics of Christian Science (p. 344) is admirable. Interesting also is his comparison of the idealistic and realistic movements (p. 5); and equally enticing, although less convincing, is his distinction between the "causal" and "purposive" views of life (p. 14 f), and his application of this distinction to the work of the psychotherapist (p. 56 f).

The book will, without doubt, be widely read, and will increase in marked degree the interest of the public in psychotherapy; and, in this connection, it may be worth while to consider the tendency of physicians who practise current psychotherapeutic methods to adopt a disingenuous attitude toward these patients. Even our author, notwithstanding his disclaimer on p. 361, shows himself to be not averse to the occasional use of trickery and deceit (*e. g.*, pp. 188, 223, 300). It is difficult to raise logical objection to quackery and charlatanry, except on general grounds; the question concerns the value of what we may call the detective attitude in the physician, an attitude which this book will without doubt strengthen in many a young doctor. In the long run, we believe better results will follow from discouraging this detective attitude, and encouraging mutual trust between patient and medical adviser, the physician being thus led in general to rely upon the correction of morbid ideas by the wholesome influences flowing from contact with life under normal conditions and in normal surroundings.

"Life Histories of Northern Animals," by Ernest T. Seton; "The Grizzly Bear," by W. H. Wright; "Latter-Day Problems," by J. L. Laughlin, are among the scientific publications to be issued by Charles Scribner's Sons in the autumn.

About a year ago Sir James Crichton-Browne delivered an address at Buxton before a section of a meeting for the discussion of questions relating to public health. He took up the problem of extensive reduction of the human food requirement, which has become a matter of general interest. An expanded version of this address has now appeared as a little book with the title "Parcimony in Nutrition" (Funk & Wagnalls Co.), and is well worthy of careful reading, particularly by such laymen as have been attracted by the doctrines associated with the names of Fletcher and Chittenden. The author is a well known English physician of extended experience, and his views are fully entitled to consideration. In a sense, there is nothing absolutely new in the book, but there is a clever marshalling of facts which make against a hurried adoption of low standards of diet

and should give pause to those who, with more zeal than discretion, have advocated such procedures. Sir James points out that the experience of mankind is with remarkable uniformity in favor of a liberal diet and abundant nitrogen, and that the human habit is justified and fully confirmed by observations made among the poor and in prisons and workhouses, as well as by the best knowledge of the food requirement of animals. The experiments of Professor Chittenden seem to him exceedingly interesting but inconclusive, and as yet quite unacceptable as a basis for a general reform of standards, particularly as to a lower intake of nitrogen. That there is much overindulgence is not denied, nor that a considerable restriction in the eating of meat would be beneficial. While economy in certain directions is much to be commended, no extended reduction in the individual supply of food may be safely advocated on the basis of our present knowledge; in fact, our author believes that there is far more underfeeding than overfeeding in the world, and that poverty in nutrition is a much more serious problem than economy.

Maria Parloa, one of the pioneers in this country of scientific cookery, died at Bethel, Conn., August 21, at the age of sixty-six. Her books are "First Principles of Household Management and Cookery," "Kitchen Companion," "The Young Housekeeper," "New Cook Book and Marketing Guide," and "Home Economies."

Dr. Max H. Runge, professor in the University of Göttingen and director of the Frauenklinik, has died at the age of fifty-nine. He wrote several books in his special field, including a "Lehrbuch der Gynäkologie."

Drama and Music.

Charles Scribner's Sons will shortly publish a comedy entitled "Open Country," by Maurice Hewlett; also a volume entitled "Roses," comprising a series of four plays by Hermann Sudermann, translated from the German by Mrs. Tenney Frank.

Popular acting is coming to be more and more a real art in Germany. In the Bavarian Highlands, Oberammergau is by no means the only place where the Biblical or legendary drama is cultivated by non-professional actors, and in the secular *Volksstück* the peasant companies of Schliersee and Tegernsee rival successfully the regular stage of Munich or Vienna. A still more ambitious, and in many respects extraordinary, dramatic undertaking is at present going on in some rural communities of Schleswig-Holstein. In Wesselburen, the native town of Friedrich Hebbel, members of the order of the Good Templars have for some time past been devoting their leisure hours to the study of Hebbel's dramas. From reading them aloud they passed on to private performances of selected scenes, until this summer they have come out with full-fledged, public representations of such plays as "Maria Magdalena," "Agnes Bernauer," and "Gyges und sein Ring." The earnestness, simplicity, and power of these performances attracted such attention that neighboring towns, such as Meldorf, Lunden, Marne, asked for repetitions; and it seems as though popular Hebbel festivals were to be a regular feature of the higher life of the sturdy Ditmarse farming population. Preparations are already on foot for the celebration of Hebbel's hundredth birthday, in 1913, by a performance of his Nibelungen trilogy. That a play of such philosophic depth and psychological complexity as "Gyges und sein Ring" should have been impressively acted by a company the stars of which were a carpenter, a rural dentist, and a peasant girl, seems remarkable indeed. A curious concomitant result of this dramatic activity of the Good Templars is reported to be the extension of their anti-alcoholic principles.

Max Grube's "Adalbert Matkowsky," the last volume in the Dramaturgische Plauderein Library (Berlin: Herman Paetel), is little short of a complete biography of the distinguished German romantic actor, whose death was recorded in the *Nation* of April 8. There are personal reminiscences of Matkowsky in his younger years of preparation, at rehearsals, and behind the scenes, and an examination of him as a man. His most successful rôles are characterized, and several portraits of him in private life, and as Sigismund and Macbeth, are given.

News reaches us of the death of Wilhelm Millowitsch, founder of the famous Volks Theater of Cologne. His popular drama, enacted by living players, was a successor of the marionette theatre of Christaf Winter, founded in 1802, in which popular local types were represented by puppets.

"Success in Music and How It Is Won," by Henry T. Finck, appears among the publications to be issued by Charles Scribner's Sons in October.

Oliver Ditson Company have added four new volumes to their excellent Musicians' Library, bringing the total list now up to fifty.

The *Corriere della Sera* announces that the Association of Italian Musicians has completed a catalogue of works on the theory of music found in the Reale Biblioteca Palatina, the churches of San Giovanni and the Stucata, the cathedral and the baptistry of Parma, where this society has its headquarters. This investigation has brought to light many works of great interest by forgotten authors, such as three volumes of "Aron," printed at Venice by Master Bernardino and Master Matteo de Vitali in 1523 and 1529; an Aristoxemus, Venice, 1562; a "Regula musice plane," by Fra Bonaventura of Brescia, printed in round characters, in 1497, and with wood cuts; a "Nicolay Burti Parbensis musices opusculum," printed in 1487 in Gothic characters and coarse figures. Among other works of the late fifteenth and early sixteenth centuries is a manuscript divided into three parts, with curious musical compositions. Some fine musical dialogues by Vincenzo Galilei (1581) have been found, and works of Glureamus (1547), Kircherius (1650), Lanfranco (1533), Pontis, Rameau, Francesco Salina, and other sixteenth-century authors, and a large number of sixteenth and seventeenth-century publications. It is the intention of this association to extend this catalogue so as to include all Italian works which appeared before the nineteenth century, found in any public or private library in Italy. It is expected that their labors will serve as a basis for a great critical edition of the best Italian writers. Prof. Guido Gasperini, of the Royal Conservatory of Music at Parma, is at the head of this movement.

Richard Hoffman, musician and composer, died August 17. He was born in Manchester, England, in 1831, and came to this country at the age of sixteen. He was an honorary member of the Philharmonic Society of New York, and in his younger days played at their concerts. He was engaged by Barnum to play in the first Jenny Lind concert as piano soloist. Some of his compositions were "La Gazelle," "Crépuscule," "Spinning Song," "Finland Love Song," "Crossing the Bar," and "Memory."

Art.

THE DEARTH OF ANTIQUES.

Within ten years antique objects of art have quadrupled in price. This may be taken as a rough average. With such objects as happen to be in vogue, the rise has been much greater. In part, this is due to the tactics, or rather want of tactics, of the new-rich collector. But that much abused person should not be made to bear all the blame. Inflated prices rule also in the shops which he never enters. The desirable trifles that one used to pick up in Europe for a few francs, now cost as many dollars. The demand increases as the supply nears exhaustion. The smaller antiquaries judge that their part of the business may last another ten years, but hardly more. Many of them are embarking perforce upon the dubious trade in false antiques; the more far-sighted talk of dealing in modern art. Meanwhile the search is always more intense and less fruitful. There are few hamlets in Europe too humble to have some agent whose connections reach eventually to London and Paris. But they no longer find much. Everywhere the story is the same. A noted rug-dealer and expert deems himself lucky if a single carpet of high class rewards a long trip in the East.

The causes of this dearth are many; chiefly, we think, the steady demand of the museums and the tendency of collectors to bequeath their treasures to the public are responsible. Every year thousands of fine objects are thus withdrawn from the market. In Europe, there exist at present only a handful of notable collections that can conceivably come under the hammer. Here in America, at a wide guess, there may be in private hands a thousand meritorious paintings by old masters. Of these, it is safe to say not more than a third will ever come into the market again. As regards the supply of antiques, we are at the end of an era. The main

sources were the suppressed convents, whose dispersed treasures have now mostly reached the museums or permanent collections; the churches, which are now forbidden by law to alienate their possessions; the private galleries of old or noble families, which, with trifling exceptions, have been sold out or registered as non-exportable; finally, private and illicit excavation, which is now severely controlled by statute.

Of course, we are by no means at the end of the antiques, merely of the marketable ones. Every year brings important discoveries from Egypt. The sands of Turkestan yield up interesting vestiges of lost civilizations. Persia and Babylonia have been touched only superficially. Even the colonial cities of Greece have been rather reconnoitered than explored. Yes, there will still be notable returns from excavation, but in the main the local museums will be the gainers. The art market will receive but little relief from this source.

The chief sufferers from the shortage are new museums and modest collectors. No pity need be wasted upon the antiquaries. They have developed abilities of such serpentine astuteness that they must succeed in any branch of trade. Nor need the many-millioned amateur claim our compassion. Other means of spectacular expenditure will be provided for him. The humble collector suffers already in his pocket and in unrealized desires. But these mole-like folk have, after all, a faculty for taking care of themselves. By barter, by attending sales too obscure for the dealers, by knowing a good bit more than the peripatetic agents, by familiarity with each other's possessions, and prudently accepting the opportunities opened by adversity or mortality, the small collector will contrive for a time to keep supplied. Against him, too, the age is working. As he realizes the impossibility of duplicating his modest treasures, let him murmur proudly *après moi le déluge*.

The case of the new museum—and we have many such—is harder. It must buy antiques on a rapidly rising and nearly exhausted market, or not at all. In fact, only a well endowed museum can hope to enter this competition successfully. For the smaller museums there will remain the alternative of concentrating on the art of the present, or buying small collections rather of archæological than artistic importance. Some such course will be forced upon most of our museums of recent foundation. The duty seems all the more imperative, then, that the few American museums which can afford to buy the finest examples of old art should do so while yet it is possible. Some years ago, the Boston Museum of Fine Arts took the almost unprecedented course of spending for acquisitions a large part of all unconditional gifts and bequests. The authorities judged that it was more important to capitalize works of art than cash, and the outcome, both in its artistic and financial aspects, has fully justified a course that was, at the time, criticised rather severely. Only those museums which allow great freedom to their purchasing staff can hope to make the most of an art market ever rising as it narrows.

Among the art books announced for early publication by Charles Scribner's Sons are the following: "City People," drawings by J. Montgomery Flagg; "Through the French Provinces," by Ernest C. Peixotto, with eighty-five drawings by the author; "Art in Great Britain and Ireland," by Sir Walter Armstrong; "The Art of Landscape Painting," by Birge Harrison; "Pewter and the Amateur Collector," by E. J. Gale, and "The American Girl," by Harrison Fisher.

The house at Toledo once occupied by El Greco has been presented by a wealthy amateur to the Spanish state. On the initiative of the King, and under the auspices of the Royal Academy, it will be converted into a memorial museum, and filled with works of the eccentric Cretan master.

In the City Museum of Padua has been discovered a portrait of Donatello. It is painted upon a thin beech panel, and evidently served as the cover of a manuscript. Our only other authentic likeness of the great Florentine sculptor is the sadly repainted one by Paolo Uccello in the Louvre.

To the National Gallery, in the Corsini Palace, at Rome, have been recently added the following pictures: by Nicholas Poussin, The Triumph of David; by Sodoma, the Mystic Marriage of St. Catherine; by Novelli of Palermo, St. James. This gallery has also bought the wooden sketch model made by Bernini for one of the angels in the Church of St. Andrea delle Fratte, Rome.

On July 4, at Milan, a gold medal was presented to Prof. Luigi Cavenaghi, in recognition of his service in saving Leonardo da Vinci's Last Supper from rapidly approaching destruction. The medal, which is reproduced in the July number of the *Rassegna d'Arte*, is the work of the sculptor Danielli.

While restoring the Church of S. Giuliano, Venice, a number of rolled canvases, and filthy, were discovered between the ceiling and roof. One of these, Christ Bearing His Cross to Calvary, an important canvas, measuring 2.63 by 3.12 metres, is said to be by Tintoretto. Other large compositions are attributed by ancient guides to Palma Giovane, and his minor contemporaries. The find includes two cartoons for mosaics by Aliense, a designer of the sixteenth century.

The excavation of the Roman town of Calleva, at Silchester, begun by the Society of Antiquaries of London in 1890, has been so successful that the society has decided to engage in further work of the same kind. They have appointed a special research committee to superintend all undertakings of this nature, and propose to begin operations this coming September. The site chosen by them is that of old Sarum, the exploring of which is expected to yield valuable results. At the same time they have obtained permission from the Earl of Verulam to excavate the Roman city of Verulamium, the area of which is nearly twice that of Silchester. As this is close to St. Albans, and its archæological value might be destroyed by its being cut up into building lots, the society feel the need of beginning work on it as soon as possible, and it is hoped that sufficient will be contributed by the fellows of the society and others to enable it to be started in the course of next year.

From Paris comes the report of the death of Louis Le Poittevin, the landscape painter, in his sixty-third year. He was a pupil of Bouguereau and Tony Robert-Fleury, and exhibited first at the Salon of 1877.

The death is announced of Georges Vogt, director of the technical department at the Sèvres manufactory. He was the inventor of the *Nouvelle Pâte Tendre*, and wrote, also, a number of books on his special subject.

The death is also reported, at the age of ninety-two, of Joseph Schefsky, the Bavarian sculptor.

Finance.

WALL STREET AND MR. HARRIMAN.

It is not overstating matters to say that the paramount topic of the past week in Wall Street gossip, rumor, and conjecture, and the dominant influence on the movement of speculative values, were the questions whether Mr. E. H. Harriman was or was not on the point of sailing from Europe for New York; whether he was or was not in better health than when he left America; whether he was coming home to a sick chamber, or to the directors' room of the Union Pacific. When news that he was about to sail was received, prices of stocks advanced on the supposition that his return meant announcement of a "railroad deal," or renewal of the Stock Exchange boom. When it was next announced that Harriman was still a sick man, and that the European specialists had prescribed a programme of complete rest and abstention from business activities, the stock market broke with great violence. People of the less imaginative sort suggested that there were other good reasons for the 10-point relapse than "Harriman's health"—the fact of an overdone and artificial midsummer rise, for instance—but Wall Street insisted that the market was moving according to the news from Harriman.

Now all this demonstration, so far as it actually had any such cause, will possibly take its place, in the minds of the average serious observer, as a piece of Wall Street foolishness. A market whose

intrinsic values depended on the presence of a single financier would be a peculiar market. Furthermore, Wall Street's reasoning that Harriman's return ought to put up prices appeared to overlook the fact that his absence, since his departure for Europe on the thirty-first of May, has been contemporaneous with an excessively violent rise in stocks. Evidently the rule was not supposed to work both ways. Nevertheless, the fact of Wall Street's supreme excitement over an absent financier remains, and it may be profitable to inquire just what is the basis for it.

One basis undoubtedly is the rooted belief on the Stock Exchange that powerful capitalists fix the value of securities. Wall Street does not go to the length of the La Follette theory; but it holds very firmly to the notion that "bull movements" are primarily the result of individual initiative and manipulation. Most of the professional contingent and its satellites would hesitate to assert that the "multi-millionaires" can construct bull movements in a period of real adversity. Yet there are those who maintain this doctrine also, the presumption being that many scattered operators might be willing to bid up prices but unable to do it effectively, because of lack of concentrated effort and organized operation. Therefore, the reappearance of a "leader" is in their eyes a "bull point" in itself.

Of recent years another argument for the theory of "one-man markets" has gained equal vogue, based on the reasoning that capitalists daring enough and powerful enough to divert bank surpluses and corporation cash balances into the speculative stock market can do for "bull movements" what no one relying on his own capital or credit could achieve. This, too, might serve in part to explain the attitude of Wall Street towards this week's news and rumor. No attention seems, however, in applying conclusions to the existing market, to have been paid to a certain forecast made by the subject of these various rumors. Just before sailing from New York in May, Harriman expressed his views to this effect:

> If we have favorable weather and correspondingly large crops, I look for happy times. There will be a big burst of speculation and a rise in the price of everything, but these will quickly grade down from the top to whatever level the crops make logical . . . . If a tide of speculation sets in rapidly, and we jump things up thirty or forty stories and then smash, the fall will naturally be greater.

The obvious field of inquiry would be, at what stage of such an advance as prices have had this summer would the market be in the fortieth story?

In some minds, there was another and a larger reason for the wide financial interest in Harriman's return, and in his physical condition. It arises from reflection on the extraordinary character of the structure which Harriman has built up in the investment and credit markets. Never, perhaps, in the history of the world's financial markets has so extended and complicated a set of machinery been put in operation. Its author knew every cog and wheel and pivot in it; that is quite generally admitted. But a safe piece of machinery is one that can be relaxed or stopped without danger to any of its parts, and there were those who felt some apprehension as to whether Mr. Harriman's invention could conform to those conditions. His own operation of it, at all events, seemed to involve the forcing of its speed to the utmost limit, and the extending of its connections in every direction, and sometimes machinery of that sort becomes difficult to control.

Supposing the author of this mechanism to relinquish his part in the controlling of it, Wall Street itself will not fail to raise the question, to whom would he hand it over? This question may have had its share in the week's misgivings over the cables from Cherbourg and Vienna. It is a question which sooner or later will be uppermost in the serious discussions of finance. The most hopeful view of the case is that this danger-spot in the credit situation will be taken in hand by conservative and prudent men, and much of the past few years' work of Mr. Harriman be cautiously undone. It will require men of large calibre to accomplish even this; but it is quite as conceivable that competent men for that work could be found as that men capable of driving the machine ahead without invoking disaster could arise.

BOOKS OF THE WEEK.

Andreieff, L. The Seven That Were Hanged. The Tucker Series. New York: E. C. Walker. 15 cents.

Our Most Popular Bonds

We make a specialty of bonds secured by first liens on valuable farm lands. Some of them are tax liens—municipal obligations.

They pay 6 per cent.—a higher rate than can now be obtained on any other large class equally well secured.

They are issued in denominations of $100, $500, and $1,000, so they appeal to both small and large investors.

Short time or long time, as you prefer.

We sell a general line of municipal, railroad and other public utility bonds, but we consider these particular bonds the most attractive in the market. They are preferred by a large majority of our customers — people who know about them.

We have written a book about these bonds—a book of unbiased facts and clear information. Every investor, small or large, owes to himself its perusal. The book is free. Simply write us a postal, or send us this coupon. Please do it now.

Ready this week

Melchisedec

By RAMSEY BENSON, author of "A Lord of Lands." $1.50.

Remarkable characters and a faithful record of spiritual development domiuate this story of the Northwest.

It is the story of a quarter-blood Indian waif, who has much the quality of a mystic. An instinct prompts him to leave the northern wilds where he was born, and leads him to siugular adventures amoug the palefaces and through these to the discovery of his mission, which he conceives to be the recall of the Christian ministry to the way wherehy it Is to save the world. In the pursuit of this missiou he encounters various adversaries, uot least among them falling in love.

Chinese Immigration

By MARY R. COOLIDGE, formerly assistant Professor of Sociology in Stanford University. American Public Problems Series.

Presents the most comprehensive record of the Chinaman in the United States that has yet been attempted. Beginning with the days when the aliens were welcomed as a helpful solution of the labor problem of the Pacific Coast, the author traces with painstaking impartiality the many phases of personal hostility they have since encountered, and the legislation, State and national, that has been framed respecting them. What the Chinese have really wrought as social and ecouomic factors in the United States; what their influence has been, and is likely in the future to be; their business methods, and their home life; their ideals and morai values, are conviucingly and picturesquely presented.

Earlier volumes in this series: P. F. Hall's *"Immigration; and Its Effects upon the U. S."* and G. H. Haynes's *"The Election of Senators,"*. Each $1.50 net.

Henry Holt and Company 34 W. 33 St. New York

FURTHER ADVANCES IN PHYSIOLOGY

Edited by LEONARD HILL, M.B., F.R.S. With Diagrams. 8vo, pp. viii+440. $4.20 net.

This volume is a sequel to "Recent Advances in Physiology," and deals with different branches of the science. While the former volume dealt mainly with metabolism, secretion, and excretion, this is devoted to certain problems concerning the Circulation and Respiration, the Neuro-muscular System, and Vision.

CHARLES H. KERR & CO. CHICAGO

THE "CHILD'S GUIDE" SERIES

THE cordial reception accorded to the titles already published has encouraged us in our effort to provide an educational series at once readable and instructive, and adapted not only to the juvenile mind but also to the riper intellect of the adult who may wish to learn as he teaches.

A Child's Guide to American History

By HENRY W. ELSON

350 Pages. 12mo. 16 Illustrations.

The author of Elson's "History of the United States" contributes a volume of much importanee to the "Child's Guide" Series. This carefully prepared work provides a manual which will come to be recognized as an invaluable aid to the youthful students of American Ilistory. No movement of importance is ignored, though necessarily the treatment is along broad lines. The resulting volume is one of interest and importanee.

PREVIOUSLY PUBLISHED.

A Child's Guide to Pictures

By CHARLES H. CAFFIN

A Child's Guide to Mythology

By HELEN A. CLARKE

The books are attractively bound in red cloth, with gold stamping and half-tone cover inserts, and the illustrations will be found notably interesting. Sold at a uniform price of $1.25 net; postage, 12 cents additional.

THE BAKER & TAYLOR CO., *Publishers*

33-37 East Seventeenth Street, NEW YORK

NEXT WEEK

The Nation

WILL PUBLISH

An Educational Number

It will contain several pertinent articles, the leading being by Prof. Wm. MacDonald on Summer Schools in the Universities. Recent text-books will be reviewed.

4,000 extra copies will be mailed to teachers in schools and colleges.

Usual rates for advertising.

The Nation.

NEW YORK, THURSDAY, SEPTEMBER 2, 1909.

The Week.

The *Commoner* of Mr. Bryan points to the fact that the only notable victory won of late years by the Democracy was in 1892, when it flat-footedly opposed protection. It urges that a tariff for revenue be made the issue in the immediate future. One does not know whether to rejoice over Mr. Bryan's tardy conversion, or to deplore "the years that the locust hath eaten," while he was worshipping false gods. More than any other living man Mr. Bryan is responsible for having induced the Democratic party to forsake its great historic issue. He has persistently led his followers through the quagmire of novel heresies. He has blown a thousand blasts against the gold standard, against corporations, against the present system of individual bank responsibility, against private ownership of railways. But from the day of his first nomination, he has never staked the whole political battle upon the historic mission of Democracy—the eradication of favoritism to particular interests by Federal taxation. His belated conversion is only another proof of his fatal lack of foresight and his total incapacity as a statesman. If sincere, it should be followed by his tacit willingness to fight in the ranks. But there is time left yet before 1912 for him to discover half a dozen other paramount issues.

It may be that Mr. Morrison, secretary of the American Federation of Labor, has no technical *locus standi* in asking the Department of Commerce and Labor to investigate the conditions of alien laborers at the Pressed Steel Car Company's works at McKee's Rocks. The strikers are not members of the American Federation of Labor. Besides, unless the company has violated some Federal statute such as the Contract Labor law, or the law prohibiting peonage, the State of Pennsylvania would seem to be the proper authority to conduct such an inquiry. But in a broader, non-technical sense, and standing simply on his rights as an American citizen, Mr. Morrison and everybody else is vitally concerned in a political way in the pointed issue Mr, Morrison raises:

> Laborin' man an' laborin' woman
> Hev one glory an' one shame.
> Ev'y thin' thet's done inhuman
> Injers all on 'em the same.

And the charge made is that the Pressed Steel Car Company is enabled by the tariff to exact high prices for its product, but that instead of sharing its gains with its workers, it grinds down and oppresses many of them with a meagre wage. As Mr. Morrison puts it, it is "not giving labor what is justly due it." The strike at McKee's Rocks ought to prove that the pretence that the tariff is devised in behalf of the laborer is buncombe, pure and simple. If the eyes of the wage-earners themselves are opened to this fact, the greed that now drapes itself in the hypocritical disguise of tenderness for the laborer will stand exposed.

The confession of Judge Gary, at the dinner in his honor given by the Sheffield Chamber of Commerce, that he had no objection to free trade, if only it were universally adopted, is now characteristic of our greatest iron masters. Mr. Carnegie, it will be remembered, has delivered himself to the same effect, that the American steel and iron industry no longer requires protection. Reciprocal trade conditions between all the countries of the world, to which Judge Gary expressed himself as favorable, take on increasing attractiveness when the provincial state of industrial development has once been passed and world-wide maturity attained. One can, however, understand something of the fury which this Olympian open-mindedness excites in the breasts of lesser producers who think that their profits now depend on the tariff. These devotees of protection shrink from that readjustment of methods and processes which they would have to face if the arbitrary screen behind which they are sheltered were lowered. And others who know that their prices are artificially boosted by the tariff vent their indignation upon the selfish treachery, as they term it, of those who have arrived at the top of the tree, and who coolly question the utility of artificial ladders for scaling the magic bean-stalk.

The unwonted promptness with which all of the executive departments of the Federal Government have drafted their preliminary estimates for expenditure, is an earnest of the novel spirit of economy which actuates the Administration. There is no doubt of President Taft's deep-seated purpose to effect the utmost saving of public money compatible with administrative efficiency. Ordinarily, the preliminary estimates are submitted about October 15. After being canvassed by the Treasury, they are assembled in the book of estimates, which, having received the President's sanction, is transmitted to Congress. The thick quarto still bears the rather quaint title of a Letter to the Speaker of the House of Representatives. The Secretary of the Treasury, from whom the "Letter" purports to emanate, is the single legalized channel through which all official recommendations of proposed expenditure in detail must pass. It is unfortunate that the Secretary's freedom is hampered in some respects by statutory regulations prescribing the items to be included in the official estimates. Nevertheless, he still has considerable leeway, and may trim and pare the figures of the various bureaus so as very sensibly to affect the total estimates. An early compilation, therefore, will give the Secretary more than the usual period for inquiry and review. There will result almost to a certainty a carefully scrutinized list of appropriations awaiting the action of Congress when that body convenes in December.

The high character of recent appointments in the Bureau of the Census, is maintained in the admirable choices made by Director Durand of experts to prepare and formulate the various schedules. This preliminary work of devising schedule questions, which shall be at once practicable and of a character to throw light upon the real conditions of industry, is an important and delicate work. Most of the appointees for this task are trained economists, many of them now holding university positions. Typical of the new kind of coadjutor is the committee to draft the *questionnaire* for the agricultural schedule. Of the four members of this com-

mittee, Prof. T. N. Carver is a professor of economics at Harvard University, Mr. Coulter is an instructor in agricultural economics in the University of Minnesota, Prof. H. C. Taylor holds the chair of agricultural economics at the University of Wisconsin, and Mr. Warren is professor of farm management and crops in Cornell University. All of these gentlemen have an expert knowledge of the subject. Their equipment and character, like those of their colleagues on the committees on manufactures, dependent classes, and general statistics, should give the next census a unique position amongst informing official inquiries.

The widespread interest in the betterment of city government is indicated by the attendance of nearly one thousand delegates at the convention of the League of American Municipalities at Montreal. That city has recently discovered graft in its own administration so that the choice of a meeting place proved most opportune. From the secretary's address, it appears that forty cities in this country have already adopted some variety of the commission type of government, and thirty-three other cities scattered over twenty-five States are at present considering this new plan. The moot question of State versus local control of municipal public utilities called forth the usual differences of opinion in the convention. It seems not at all unlikely that the present time may in retrospect be known as the era of political enlightenment. With campaigns and non-partisan conventions and associations dealing with taxation, city government, direct primaries, the short ballot, public utilities, and all sorts of administrative problems, it will be strange if a final precipitate of wisdom is not thrown down for the healing of the nation.

The action of the Pure Food Association in endorsing the findings of the Remsen Board of Referees upon the use of benzoate of soda as a food-preservative will be regarded by the general public as final. The vote, though in favor of the board by only 57 to 42, is the more significant in that last year the association took strong ground against any use of benzoate whatever. The courts, especially in Indiana, where suits are pending in both Federal and State courts upon injunctions to restrain the enforcement of rules prohibiting the use of this preservative, will now have some additional light by which to arrive at their decisions. It must, however, be remembered that the Remsen Board was charged merely to answer certain specific queries, and has made no recommendation as to the administration of the Pure Food laws. That four grams per day of this preservative are not dangerous to the consumer's health, and that benzoate does not disguise any original defect in the materials preserved, may be taken as proved. But whether the Secretary of Agriculture is to permit the use of this preservative in unrestricted amounts, and whether its use is to be indicated by a compulsory label, are matters of administration, upon which the chemists' verdict does not bear. It is to be hoped that Dr. Wiley will persist in his determination not to resign his position, and that he and the Secretary of Agriculture may unite upon some administrative regulations which will guard the health of the consumer without jeopardizing the legitimate use of the preservative in question.

Geography is also among the progressive sciences. This is the upshot of the address of Sir Duncan Johnston, president of the geographical section of the British Association for the Advancement of Science, holding session at Winnipeg. The idea that work in geography must now take on an exclusively intensive character, and consist of surveys, rather than explorations, has been thoroughly disproved of late years. Not only Shackleton's and Sven Hedin's polar expeditions, but Stein's discoveries in Khotan have shown how imperfect is our knowledge of physical geography and grades of civilization. The Duke of Abruzzi is investigating unknown regions on the northern Indian frontier, while Mongolia, West Africa, New Guinea, and both poles are besieged by eager explorers who will certainly add vastly to our knowledge of the topography and demography of the globe. Within a fortnight announcements have been made of the finding of a hitherto unknown glacier on the Alaskan coast, as well as of the vestiges of an advanced civilization once seated in that region. It is always dangerous to think of any department of science as a closed book. Once let some definitive treatise be read as the funeral service over further advance in any branch of knowledge, and forthwith discovery or invention delights to run riot in that very field.

Medical ethics is a mighty deep for the layman to embark upon, we know, yet recent events make us wonder what are the exact laws compelling a physician to reticence. If it is a mere King or President who is ill, we expect to have a medical bulletin, conveying to the public more or less of the truth. But apparently this rule does not hold for a great financier, whose health is one of the elements in stock-gambling. About his condition, we are permitted to learn nothing. His physician "cannot speak." His chaplain speaks, so do his relatives and a visiting banker, but the faculty is dumb. Yet a foreign physician, who has treated the financier, talks freely to reporters, giving his view of the case. It is only the doctors now in charge who are bound over to professional secrecy. We do not question their delicacy or conscientiousness; but their course shows that the code of medical ethics will have to be rewritten.

Nowhere in the world, not even in Russia, has there been a Yiddish theatre of any such importance as that on the East Side of New York. Russian-Jewish customs, the realistic idealism of the Russian, given a local setting amid the conditions of the New World, have received, on the boards of the Bowery and Grand Street Yiddish theatres, a multiform and vigorous representation. Very little of it, of course, has been "pure art." Much of it has been farce and operatic mixtures, and melodrama crops up in almost every Yiddish play. But isolated scenes are often of searching and genuinely dramatic power, acted with passion and directness. It is therefore regrettable to hear that Jacob Adler, best known of Yiddish actors and managers, announces that, in consequence of the demands of the actors' unions, he is not able to run his theatre, and that he will lease it to a moving picture show. They demand, he says, exorbitant increases in salaries, and also the employment of more actors than he can use. It is said that the vitality of the Yiddish theatre has, of

recent years, somewhat fallen off. Jacob Gordin, the "Shakespeare of the Ghetto," is dead, and even before his death his prestige had waned, partly because of the growing extravagance and unreality of his manner and theme. Yet the Yiddish theatre has been a remarkably living and complete reproduction of the life of a people. Not only was the life of Hester Street, and of the old orthodox Jew, with his picturesque psychology and infinite tradition, artistically represented on the stage, but also the Russian "intellectual" life—the life of Muscovite art and modern social and political yearning.

When a Duke goes out into the market-place and asks piteously how he can economize without inflicting hardships upon others, it is certainly an act of charity to tell him. Sir Edward Grey lately undertook, in an open letter, this kindly office for the Duke of Northumberland. That nobleman had maintained that the new taxes would compel him to retrench, but that he could not cut down his expenses without lowering wages, dismissing servants, etc. But Sir Edward points out that if a man owns more than one house, in town or country, he can lease one, with an obligation on the occupier to keep it up. As the Duke has two castles, besides Syon House in Brentford, and a town residence in Grosvenor Place, the bearing of the advice is obvious. Besides, a landed proprietor often has shooting rights, which he can sell or let, thus increasing his own income without diminishing employment. Sir Edward puts in one important *caveat*. He warns the Duke that he is not speaking of retrenchments that will be pleasant, but only of those which are possible.

The accounts of the arrival of the Zeppelin III in Berlin make interesting reading for those who still think of the Germans only as a phlegmatic and stolid people. Not even Bismarck at the height of his popularity ever received a greater ovation than that accorded to the veteran inventor. That the sight of a great airship manœuvring over a city appeals powerfully to the imagination is, of course, true. But the German enthusiasm is not to be attributed solely to elation over an epoch-making spectacle. Industrially the most diligent and intelligent nation on earth, Germans have a profound respect for the man who takes the leadership in fresh fields, conquers nature anew, and applies science to the solution of a problem. The national rise to commercial greatness in so short a space of time is due to this readiness to turn to men of science for industrial advice. It is a commonplace that the Germans are years ahead of other nations in the practical application of the newer chemical learning. They have not been afraid to go to philosophers of the closet for aid and suggestion, and every professional discovery has enhanced the respect for the man of learning. Hence comes the profound admiration for Zeppelin among the thinking classes. That there is also much of the popular enthusiasm which everywhere attaches to a new record or to a spectacular discovery we would not deny. But the public looks to positive results of value from the leadership of Zeppelin.

The airship carnival at Rheims has marked a great step forward in aerial science. We refer, of course, not to the broken records, nor to the unparalleled number of contestants, nor to the unnumbered spectators. What it will really be remembered for, when even Blériot's name shall have been forgotten, is the imposition of the first fine for reckless flying inflicted on this earth. Later on, of course, we shall expect to see aerial courts held in captive balloons around which hover the speeder, the air-cycle policeman, and the witnesses, while the judge pronounces sentence; but until then the fine for offending above will be imposed below. The Rheims miscreant, M. Lefèbvre, paid $4 for turning corners too quickly and failing to slow down at air-current crossings, and was then congratulated for having become an historic offender. M. Lefèbvre to-day doubtless likens himself to Adam as the first of another long line of sinners. We trust he was duly warned that a second offence will be more severely punished, and that a third will land him in jail, even if his speedometer should show twenty-five miles an hour less than that of the policeman who arrests him.

The Argentine Republic's foreign trade statistics for the last year will probably be used to bolster up the subsidy campaign soon to be made in Congress for fast steamship lines to South America. The statistics in question show that the United States ranks third in foreign trade with the Argentine. Great Britain leads with $23,899,855, in exports; Germany stands second with $11,789,490; and the United States third with $8,987,317. Mr. John Barrett, the director of the Bureau of American Republics, comes forward with the usual remedy. Unless there are "fast and commodious steamers" to carry passengers, mail, and express traffic, he thinks that commerce between the American republics cannot be expected to grow. In the promotion of this commerce, the State Department in conjunction with the Department of Labor and Commerce will translate the commercial laws of South American States into English for the benefit of our merchants. It is hardly necessary to remark that our merchants would do far better to acquaint themselves and their agents with the language of these countries than to possess English translations of South American codes. One of the main reasons for Germany's expansion in foreign trade is the scientific way German merchants study foreign fields. Their factors speak the languages of the countries with which they trade. Their prospectuses appear in the same tongues. They study the methods of packing goods that are customary in these countries.

Another "crisis" in Greece is tided over, growing out of Cretan unrest, but the question of Crete remains full of explosive material. Greece strongly desires the formal annexation of Crete, and so do apparently the majority of the inhabitants of that island. In intervening to prevent immediate action towards union, the Powers say nothing about the ultimate solution of the problem. Their only explanation is that they cannot permit at present a rupture which would endanger the new régime in Turkey, or imperil the peace of Europe. In the end, there can be little doubt, the flag of Greece will be hoisted in Crete, and allowed to stay there. The old passion for liberation from the Turkish yoke still burns in Cretan bosoms. That it also continues to kindle in life-long sympathizers at a distance, is shown by the remarkable letter which the *Evening Post* recently published, written by Julia Ward Howe, in behalf of Cretan freedom.

ADMINISTRATIVE DISCIPLINE.

The resignation of Mr. McHarg, Assistant Secretary of Commerce and Labor, is to be accepted by the President. This follows hard upon Mr. McHarg's public attack upon the policy of forest and water-power conservation, with open sneers at colleagues in the government service. It is explained, to be sure, that the assistant secretary did not, in any case, intend to stay in the Department longer than October 1, so that his resignation may be merely hastened by recent events. But the public will be sure to take it as a pendant to the Pinchot-Ballinger controversy, and as a sign that Mr. Taft has determined to put an end to the bickerings among his subordinates. It certainly was time for official discipline to be vindicated and enforced.

It is well known that, under President Roosevelt, administrative methods were left at loose ends. With a Chief Executive who could let nothing alone, we had also a set of subordinates with no due sense of subordination. Assistants magnified themselves above their immediate superiors. Commissioners ignored Secretaries. It was common for Mr. Roosevelt to go over the heads of his Cabinet officers and set men under them to working directly on his orders. To him they also reported directly, instead of through their titular chiefs; and the sight was frequent of commissioners and special agents hovering about the President, or dragged out by him into the limelight that beat upon the White House. This made them happy and proud, no doubt, and fed the newspapers with sensations, but it was not good administration. A President who would do his work easily and well, must dispatch the vast business of his office in an orderly manner. Having chosen his heads of department, he must work through them, giving them great responsibility, but then holding them responsible. Their assistants must get orders from them, and must be content to report to them, instead of flying to the President. This is the natural method of large administration, which, it is evident, President Taft has sought to restore. The bevy of favored assistants is no longer seen daily at the White House. The President does his official work through official channels. This is as it should be. It may be hard on the young heroes who used to bask in the Roosevelt sunshine, but it will do them good to work again for the joy of working, fulfilling in hours of gloom, as the poet advises them, the tasks in hours of insight willed.

More is needed, however, than this due subordination. There must also be something like "team play." An official in one department should not be allowed openly to rail at one in another. Least of all, should public charges and recriminations be permitted to fly back and forth between different members of the executive departments. The unhappy significance of the dispute between Chief Forester Pinchot and Secretary Ballinger, as now of the railing accusations made by Mr. McHarg, has been primarily that the President's subordinates were not pulling together, and that discipline was breaking down. If these men have their sharp differences, the thing should be kept to themselves, or settled privately, not shouted from the housetops. If there is an issue of fact, let it be tried out in the office, before their respective chiefs. If it is a question of public policy, let them remember that it is not their function to shape it. Whatever information or advice they have to give their superiors will doubtless be welcome; but having given it, they should keep silence; or, if the President and his Cabinet go on making such grievous mistakes that the fourth assistant or the third deputy simply cannot stand it, resignations can always be offered and accepted.

Behind all these questions of administrative method and of the personnel of government, stands a larger issue. It is that of procedure in accordance with law. This lies at the root of the agitated differences between Mr. Pinchot and Secretary Ballinger. The latter, with the approval, of course, of President Taft, made up his mind, as a lawyer, that the action of the Roosevelt Administration, towards its end, in withdrawing great tracts of forest land, was without due warrant of law. That being so, there was nothing for it but to rescind that executive order, as it has been rescinded, care being taken that no site for water power should be covertly taken up. It is not contended that the policy which Mr. Pinchot advocates is not wise. The fullest recognition is made of his fine spirit and self-denying labors. But the new Administration sets out to comply strictly with the law governing this and all other matters. It is to be presumed, therefore, that President Taft will lay the whole case before Congress, and urge the enactment of statutes to make entirely legal what is confessed to be desirable. This is no reversal of the "Roosevelt policies," except as they were policies without regard to the law.

In taking this stand, President Taft must have been fully aware that the pack of little idolators of Roosevelt would open on him. They are, in fact, already in full cry. But it would, in any event, have been impossible to satisfy them. They were persuaded, from the first, that "Taft was sure to make a mess of it," by contrast with his predecessor, and it was only a question of time when they should proclaim the worst, with brandished muck-rakes. Those modern implements of torture the President can well afford to disregard, provided he succeeds in asserting administrative discipline and basing governmental action firmly upon the law of the land.

REFORM OF JUDICIAL PROCEDURE.

The American Bar Association does well to heed the growing dissatisfaction with the administration of justice through the courts. At the meeting in Detroit, the committee, appointed two years ago to consider the evil of the law's delays and the vexing uncertainties of litigation, has brought in a report which is at once an admission of abuses and an effort to correct them. This representative body of American lawyers rightly feels that the initiative in reform must come from them. It is a question of professional obligation as well as professional standing. If the law is too often brought into contempt, and courts made the object of bitter and well-founded reproach, it is time for the bar to bestir itself.

In the comprehensive and radical recommendations of the committee, we find first, decided approval given to the doctrine of "harmless error." That is to say, the committee urges a reform by which verdicts shall not be set aside for technical error that does not go to the merits of the case. The Supreme Court of Oklahoma has recently refused to reverse a lower court, though obvious but unimportant errors had crept into the trial. It is no derogation of justice to maintain that a litigant has

enjoyed all his legal rights even if some minor ruling against him by a judge was not strictly correct, so long as the decision against him, on the real issue joined, was manifestly just. This particular reform in judicial procedure has long been advocated by enlightened judges, like Mr. Justice Brewer. President Taft has also put himself on the side of those who would have the courts think more of substantial justice than of impeccable technique, and make the trial and adjudication of cases simpler, swifter, and less costly. In this sense, the committee of the Bar Association proposes several changes in procedure, to do away with the duplication of papers, multiplication of court officials, and the like.

When all is said and when every reform of method is made, much will depend upon the diligence and efficiency of judges. It is undoubtedly the fact that too many of them are deficient in industry, or in capacity to keep up with the business of their courts. The law's delays are too often the delays of a judge. A case in point comes from Indiana. One judge in that State has had before him for more than two years a demurrer in a suit wherein the plaintiff alleges that, for over six years, he has been kept out of the use of $10,000 rightfully belonging to him. Yet over a mere pleading in demurrer a lazy judge has dawdled for two years—and this in spite of the clear law of the State:

> Whenever any issue of law or fact is submitted to the court for trial, and the judge shall take the same under advisement, the judge shall not, except in the case of severe illness of himself or family, hold the same under advisement for more than sixty days.

If judges themselves will not obey the law, how can they expect to force others to regard it? Such abuses as this if unchecked will run into such scandals as used to make the delays in Chancery in England so notorious. Lord Eldon once held a case "under advisement" for more than twenty years, and even then could be spurred to a decision only by Brougham's bringing the matter to the attention of Parliament.

The second part of the committee's recommendations looks to a reorganization of the courts themselves. This is not to be acted upon immediately; the intention is to have the matter considered by the profession and brought up for decision next year. In general, the proposal is for the embodiment of the judicial power of each State in a court that shall be an organic whole, consisting of three branches—county courts (including municipal), a superior court of first instance, and a single ultimate court of appeal. This system should be so organized as to prevent both waste and conflict of judicial work, and should have a directing head who should be "responsible for failure to utilize the judicial power of the State effectively." Something like this system is submitted to the voters of New Jersey, in the constitutional amendment to be passed upon in a special election next month. Its acceptance by that State would obviously further its general adoption, as urged by the Bar Association.

It is needless to labor the high importance of these proposed judicial reforms. There is doubtless much unreasonable discontent with the processes of the courts, but there is also a great deal that is justified. To remove it as speedily and completely as possible, is the plain duty of bar and bench. That reverence for judges and courts which all sober-minded citizens feel it essential to keep unimpaired, will be heightened by the very sight of the leaders of the American bar undertaking to make justice more prompt and sure.

THE ZINC-ORE TARIFF OUTRAGE.

On March 20 last, according to the *Mining and Engineering Journal*, the price of sulphide zinc ore was $40.00 per ton; on August 14, the price was $52.50. This simple statement tells the story of as barefaced a tariff robbery as has yet come to light since the passage of the Payne-Aldrich law. A clearer illustration of government sanctioned graft, it would be difficult to find. Zinc-ore under the Dingley tariff was on the free list. Secretary Shaw once made an effort to lay duties on imports, but after prolonged litigation the government was compelled to refund the amounts he had collected. Thereafter, zinc was imported free until the "revision downward" of this summer, when, in the face of many protests, zinc-ore was taken from the free list and not merely a duty levied upon it, but a prohibitive duty. From free trade to total exclusion of foreign ores—that is what explains the more than thirty per cent. rise in the price per ton.

Now, a duty of one cent per pound of zinc contents in zinc-ore means a duty of $12 per ton. The new tariff places that duty of one cent per pound on all ore containing over 25 per cent. of zinc—the quotations we have given were for 60 per cent. zinc-ore. Hence the price of ore has already reached the high level made possible by the tariff. Thus the government has as plainly put $12.50 into the pockets of every zinc mine owner who produces a ton of ore as if Congress had ordered it paid in cash. Zinc mining is, of course, no manufacturing enterprise. There can be no talk here of protecting home skill and industry; nor does the wage difference really count, in view of the accessibility of domestic markets. It cannot, moreover, be alleged that this is an infant industry in need of protection. Besides, prohibition is not protection even according to the gospel of McKinley. What has happened is that Congress has deliberately created a monopoly and said to the rich Missouri zinc producers: "Here, mulct the American people as you see fit." For the price of spelter, which corresponds to pig iron, has, of course, risen with that of the ore, from $4.75 at New York on March 20 last, to $5.82½ per 100 lbs. on August 21.

To state the case in another way, Congress has licensed the ore producers to tax American consumers at the estimated rate of $2,500,000 a year, all of which goes straight into the pockets of the mine-owners. Yet zinc is really the "poor man's metal," being used in galvanizing, in making brass, and serves many other purposes when the consumer cannot afford copper or porcelain or bronze. It is characteristic of the hypocrisy of the Republican party in all tariff matters that, deeply concerned as it is about the welfare of the laboring man, it is quite ready to let him pay tribute to the zinc-mine owners for every zinc article he purchases. The pretence is, of course, the protection of the miner in the Joplin district of Missouri which produces 60 per cent. of the zinc of this country. There could not be a flimsier pretence. The real reason is that Speaker Cannon, when campaigning in that district last year, promised to put a duty on zinc ore if a Republican member were returned from the Joplin district. The Republican was chosen, the Speaker has kept his word, Congress has done his bidding. If he could not pay Littauer what he owed

him politically, he has settled in full with Joplin.

We do not ask any one to take our word for it that the duty on zinc-ore was unnecessary. We have experts' opinions for it. Jesse A. Zook, the leading statistician of the Joplin district, in an article in the Joplin, Mo., *Daily Globe* for January 26, 1908, thus summarized the results of the trying year of 1907: "The lesson of the 1907 panic has clearly demonstrated that the Joplin district can stand a severe panicky condition, and continue the output of ore necessary to keep the smelters supplied." It quoted with approval the opinion of another expert, Walter Renton Ingalls, in the *Mining and Engineering Journal*, who declared that in the light of 1907, "foreign ores are not serious competitors of the American, *duty or no duty*." To this, Mr. Zook added the significant statement that "no importations of ores were made [in 1907], except to supply a demand in excess of the domestic production." All of those facts were brought out during the debate in Congress in which Senators Burton of Ohio and Kean of New Jersey were conspicuous in their opposition to the duty. But the Speaker's word had been given and no more than a king's could it be broken. Mr. Kean was particularly useful in proving by an authentic letter that a chief lobbyist from Joplin was actually buying up Mexican ores for sale in Europe, in the confidence that they would be prohibited here. He also brought out the indisputable fact that the Joplin district is beyond foreign competition, and that any protective tariff on ores "is equivalent to a premium on the speedy exhaustion of certain natural resources, which, once used, can never be reproduced."

Never was a case more clearly proved, but there was no one at hand to settle the matter in favor of the ultimate consumer. Mr. Taft made his stand on other schedules and left the mine owners and controlling politicians to settle it to suit themselves. This sort of thing is the reason why to growing numbers of persons protection is synonymous with theft and corruption. The Joplin mine owners, not content with having control of a rich gift of nature, wanted a law to swell their profits. Of course, they had Democratic aid for their schemes: Senator Stone was quite aware of the necessity of placing a tariff for revenue only on zinc-ores and favored it with Democratic subtlety. But this merely illustrates afresh the truth that one cannot touch the tariff pitch without being defiled. It would have been much better, because far less corrupting and more equitable, if Congress had voted the $12.50 per ton out of the Treasury direct.

THE OUTPUT OF DOCTORATES.

There is always experienced a sense of relief when the final statistics of a periodic movement are announced. When we know the exact number of commercial failures for the year, or learn the precise extent of Fourth of July casualties, there emerges the feeling that now at least we have the worst. Something of this character must be our reflections upon the completed score of Ph.D.s conferred in the last academic year. To *Science* for August 20, we are indebted for this information, as well as for comparative figures for the past twelve years. Three hundred and seventy-eight doctorates were conferred by American universities in 1909, exactly the same number as were granted in 1908, but more than one hundred in excess of the average for the last ten years. As yet there are not issued statistical forecasts indicating the relative condition of the forthcoming crop of Ph.D.s, or estimating the number "in farmers' hands," or "afloat." But the figures given are portentous enough in all conscience.

Twelve years ago, only about two hundred of these higher degrees were annually conferred, so that it appears that the flow of erudition has almost doubled in a decade. In the totals, for the past twelve years, the University of Chicago leads with 448 to its account, as compared with 436, 418, and 394 for Columbia, Harvard, and Yale, respectively. The Johns Hopkins University, which at the outset was easily first, has fallen astern, though if its doctorates with those of Cornell and Pennsylvania are added to those of the Big Four for twelve years past, we have accounted for 2,579 as against 892 for thirty-five other universities. Among State institutions Wisconsin comes first with 110, while there are eighty-six to the credit of Michigan and forty-seven to that of California. In the distribution of theses over the field of knowledge, the sciences in 1909 claimed exactly one-half of the total number, whereas in the first ten years of the period but 45 per cent. fell within that class. Of the sciences, chemistry out-distances the rest with a proud record of 413 for the twelve years, as compared with 202 for physics, which, in turn, is followed by zoölogy, psychology, mathematics, and botany, in the order indicated.

The summary in *Science* gives the titles of all the theses in the natural and exact sciences. In this connection one word of suggestion may be ventured. Where the technical nature of the work is such that only the expert can divine its meaning, a sub-title, preferably in English, might well be added to indicate to the lay reader something of the approximate content. For example, one stands quite unenlightened after reading such a title as: "The Intracellular Encymes of Penicillium and Aspergillus with Especial Reference to those of Penicillium Camemberti." Unless we knew beforehand that it contained an investigation in the field of science, one might suspect that it was the study of an Etruscan bill of fare. Of couse, the necessity for a sub-title does not apply universally. We know from mere inspection, for example, that degrees conferred for knowledge evidenced by "American Varieties of Beans" or "The Effect of Cold Storage on Chicken Meat" are simply typical of "the ordinary Ph.D. of commerce."

Much more serious, however, is the question how this large number of young doctors is to be assimilated by the crowded staffs of university instruction, or the limited capacities of research laboratories. The danger of an intellectual proletariat would seem not to be confined to Germany. And yet the fact is, as every college president and departmental head knows, that good college teachers are scarce, surprisingly scarce. The truth is that the doctor's degree, or the master's degree, which originally was a *licentia docendi*, has long ceased to be a guarantee of capability or efficiency for teaching. There is some grain of truth in the feeling that it often positively unfits for the kind of teaching that undergraduates most require. Specialization in research, too often leads the newly fledged doctor to look with something like disdain on the inculcation of the more elementary facts that make up the staple of ordinary col-

lege work. Almost inevitably the candidate for a college instructorship wants to stipulate that he may offer an elective course in what he calls his specialty, or at least a number of graduate courses. Many a college president must pathetically appeal to his new instructors in Tennysonian language to come down "from yonder mountain height," and "to cease to move so near the Heavens." It was bad enough when the old paradox was launched that a university course unfitted a man for business. But what shall we say of the newer paradox that the higher research often seems to unfit a man for teaching?

Despite the fact that the name of doctorate in philosophy is now employed in a purely technical sense, and that most of the German and American universities no longer require the candidate to pass any examination in a specifically philosophical course, the question emerges whether some reversion to the old idea would not be serviceable. Of course, there is no reason why an investigator in most departments should be expected to have special knowledge of any particular philosophical discipline. He may even be excused any detailed knowledge of the history of philosophical thinking. But for the bearer of the Ph.D. degree to be wholly ignorant of the more general interrelations of his province to other parts of the field of knowledge, makes for narrowness. If philosophy be construed broadly as a knowledge of the general trend of scientific thought and method; if the *commune vinculum* of the sciences be regarded as a real thing so that the various fields of research are inevitably bound together by certain intellectual filaments; and if it may be fairly presumed on the Ph.D.'s part that he has envisaged the common domain of all investigators, we might have a guarantee, which now we lack, that the newly made doctor is not the unilateral specialist he so often proves to be.

MORAL UPLIFT IN GARDENING.

The great vogue which out-of-door activities enjoy in this generation naturally creates a corresponding philosophy of nature, satisfying its devotees, doubtless, even though a bit superficial. Two notable utterances have, of late, associated gardening with an inner impulse making for the moral betterment of the Man with the Hoe. Lord Rosebery, in his speech opening the local flower show at Cramond, created one of those graceful illusions in language which quite belies his sad personal disclaimer of any knowledge of flowers. And our own Professor Bailey, chairman of the Country Life Commission, crowns his report with a pastoral on the future of the rural church which makes up in earnestness what the report may lack in beauty of expression. It is true that these two declarations have many points of divergence. Lord Rosebery is felicitously saying the pleasing thing before friends and neighbors whose flower show is quite as much intended as an occasion for general gossip as for an exhibition of plants and fruits. Our Uplift Commission, however, is in grim earnest from beginning to end. Its language is that of the Horticultural Exhibition, not that of the modest flower show. But the conclusions of both the lonely plougher of the sands and of the practical head of the experiment station are almost identical as to the intrinsic moral invigoration which the garden evokes.

Lord Rosebery's praise of the gardener's life strikes one, however, as having been excogitated rather in the library than in the open air. Its deft allusions to the story of Eden, to Lord Bacon's essay on Gardens, and to the literature of the subject—from which he expressly bars nurserymen's catalogues—lead one to conclude that the noble lord's address smells of the lamp, rather than of the sod. This, however, is probably inevitable. The most ardent woodsman is rarely gifted with his pen. It is hard to extort from him in confidential converse how he feels about nature. A Maine guide or Indian trapper can no more describe the sensations which he experiences in the open than could a moose. It requires a "Gigadibs, the literary man," to create the illusion of "atmosphere" for the magazine reader, whose enjoyment of nature is often most keen when he can read about it by the open fire, after a good dinner at home, and in the certain expectation that there will be a roof over him when he goes to bed. But the genial banter which plays over Lord Rosebery's praise of the art and healthfulness of gardening, sobers into quiet earnestness when he sounds the moral note. To the ex-Premier, "the gardener, by the nature of his occupation, is, or should be, physically and intellectually and morally the best of our rural population, . . . daily and hourly face to face with the elevating mystery of nature."

It is right here that our Country Life Commission joins hands with the English scholar. Only—as was to be expected—Professor Bailey and his confrères, not content with simply bestowing moral approval on the agriculturalist—intend to organize the State and Church for his encouragement. Averse as we are to throwing cold water on the excellent suggestions of the commission, we fear that some of its conclusions savor of an indiscriminate blending of things which have no necessary or essential connection. The idea that "a course in a good agricultural college would wisely supplement training in a theological seminary," seems to have been anticipated by the schoolboy's essay exploited by Mark Twain, where the remark is dropped that "a good many donkeys are found in theological gardens." To what extremes the proposed fusion may go is illustrated by the enthusiastic editorial support accorded thereto by the *Independent*. Says that journal: "The minister of the rural church ought to know more of what Jesus knew, and what Burbank knows." The natural query would seem to be—why ring in the founder of Christianity at all? The rural pastor does his duty to his parishioners, according to the new gospel, when he spends "half of his time either in his own garden or in their gardens and fields, talking grapes and pears, instead of original sin and total depravity." Progressive orthodoxy, too, takes on a bucolic cast, for we are told that "Experiment Station Bulletins are one of the modern forms of inspiration; revelations of the Divine Will in Nature"!

There is some danger in this blending of things and ideas which are essentially distinct. There is a world of good inherent in the movement back to the land. There is a healthful reaction against the evils of urban congestion, and a wholesome revival of the tonic qualities of life in the country. But the truth is that occupations and avocations as well as residence in town or country are, of themselves, morally indifferent, and only by reflected light take on the character and nature of the human personalities which create a moral

atmosphere. Marcus Aurelius found that virtue could be practised *et in palatio*. And despite Lord Rosebery and Professor Bailey, it is not yet extinct in city life. Historically, there has perhaps never been in the towns a sordid moral degradation comparable to the serfdom of Europe since mediæval times. The old idea that "God made the country, and man made the town," was fairly well exploded by Holmes's retort that God made the cave and man made the house. In our enthusiasm as new converts to the cult of the open-door life, let us not imagine that we have discovered a universal moral renovator. A new, a real, and an innocent delight in gardening may add immensely to our store of pleasures, but there is no certainty that, under the shade of the gardener's hat, the human heart will invariably beat in tuneful unison with the Divine.

THE STATUS OF THE SUMMER SCHOOL.

Ten years ago, the university summer school, from whatever point of view one chose to regard it, was admittedly a problem. Hardly anywhere could be found a faculty the majority of whose members did not look upon it with a mixture of distrust and disdain, or hesitate long before allowing its courses to count towards a degree. With the exception of younger men frankly in need of money, professors were indisposed to undertake summer teaching, and yielded grudgingly to the official pressure sometimes put upon them. Even presidents and governing boards showed their lack of confidence, as indeed most of them do still, by insisting, as a rule, that the school should live upon its income from fees, with the result that financial support was limited and sometimes precarious. The fact that the students, who, for some reason, manifested a disposition to come in increasing numbers, were mainly secondary school teachers without collegiate training, seemed to stamp the work as necessarily of low grade, however exalted the language of the printed announcement. One heard freely the prediction that the summer school would either degenerate speedily into a teachers' "institute" devoted to the exploitation of "methods," or else, like many another well-meant device for the dissemination of culture, would have its day and presently cease to be.

If the disturbing problem of a decade ago has not yet been fully solved, some, at least, of its conditions have unquestionably become clearer. For one thing, the summer school has manifestly come to stay. While the number of such schools does not much increase, there seems to be not the slightest reason for expecting the discontinuance of any of those now well established. It is significant that enrolments have ceased to fluctuate materially, and that growth in numbers tends to conform in the main to that in other departments of the university. Further, professors of the higher grades are increasingly willing to teach during the summer, though preferably in places other than those in which they teach during the remainder of the year; and a surprisingly large number of the best known scholars in all departments now accept such appointments more or less regularly. As a direct consequence of this wider and more representative participation in the work of instruction, there has come about a more generous recognition of summer courses in fulfilment of the requirements for degrees, and this, too, not alone by the institution under whose immediate direction the work is done, but by other institutions as well.

These are substantial gains. On the other hand, acquaintance with a number of representative schools in different sections of the country leads me to the conclusion that the summer school, considered as an agency for the spread of higher education, has as yet passed but little beyond the rudimentary stage. Neither in organization, nor in programme of studies, nor in coördination of courses and departments, nor in effectiveness of work, does it yet compare favorably at all points with the regular academic department with which it is most closely affiliated. The faculty is a constantly changing body, rarely meeting for any save a social purpose, and hired to carry out a scheme of work over the formulation of which it has little or no control. In no summer school with which I am familiar is there anything fairly to be designated as a curriculum. Of the courses offered, the majority appear to be elementary courses in subjects most likely to appeal to the secondary school teacher, and with considerable variation in subject and content from year to year. Advanced courses, though offered almost everywhere, are few in number and seem to attract few students, though at this point the experience of different schools varies considerably. While the tendency seems to be to increase the number of departments in which work is offered, rather than the aggregate offerings in each department, it still not infrequently happens that important departments do not appear at all, or are represented by one or two elementary courses only.

The make-up of the summer student body is another disquieting feature. While the number of graduates often attains large proportions—332 of the 931 students at Harvard this summer held academic degrees—the attendance of undergraduates does not seem to indicate a very widespread desire to shorten the four-year course by doing summer work. Moreover, it must be confessed that a considerable proportion of summer undergraduates are the "lame ducks," who have failed in one or more subjects, often at another institution, during the year, and who bear the burden and heat of the day for the sole purpose of making up a deficiency.

On the other hand, the overwhelming preponderance of teachers in all our summer schools creates a problem of another sort. Of the hundreds of teachers whom it has been my privilege to meet in summer school classes during the past eight years, less than one-fourth have had any college training. They have usually been relatively mature persons, predominantly, of course, women, who have taught for a number of years, and whose minds have lost somewhat the habit of systematic study. That they are zealous far beyond the zeal of the average undergraduate, that they come with serious purpose and at no little sacrifice of strength and money, and that their accomplishment in a brief time is often extremely creditable, is cheerfully to be conceded; but it must also be admitted that they are inclined to look at the subjects which they are pursuing almost exclusively from the pedagogical standpoint, and give the class-room too much the air of a summer normal school. I cannot but think that the predominantly pedagogical character of the American summer school constitutes one of its greatest weaknesses as an educational institution. The most cursory inspection of a summer announcement of courses will suffice to show how pervadingly the teacher is catered to. Of a total of eighty-six courses, not counting the courses in physical training, offered this year at the Harvard summer school, forty-one were announced as designed, more or less directly, for teachers; and the proportion is not widely different at similar schools elsewhere.

Another perplexing problem is the "auditor." In the early years of the summer school the attendance of mere listeners was not encouraged, and in some cases was forbidden; but, of late, they have come even to be bid for. A number of Western schools sell an auditor's ticket, entitling the holder to attend any lectures he pleases; and the custom seems to be making headway in the East. Where a course consists of lectures only, the composition of the audience does not perhaps greatly matter; but where recitation or discussion is the order of the day, the presence of these peripatetic truth-seekers is frankly demoralizing to the regular members of the class, if not to the instructor. That the popular or informal lecture,

dissociated from any kind of required or systematic work on the part of the listener, has a much more important place in higher education than has yet been accorded to it, I, for one, firmly believe; but experience in five large summer schools compels me also to believe that the combination, in one exhibit, of the characteristic features of a college or university on the one hand, and of a sublimated Chautauqua assembly on the other, has thus far proved highly unsatisfactory.

Two consequences, which, ten years ago, were often instanced as pretty certain to follow the extension of the summer school habit, have not thus far come about. Summer teaching, though obviously an added portion of accustomed service to the teacher, does not seem to have been the baleful source of physical and mental exhaustion which was freely predicted, nor to have interfered disastrously with the professorial study and writing for which a long vacation has come to be thought essential. Save in regions where the summer climate is peculiarly unfavorable to exertion, I have yet to hear any considerable number of university men speak of their summer teaching in terms of strain; while, with many, the change of scene is not seldom in itself a rest. I do not speak particularly of the advantages of summer school work in facilitating university interchange, or increasing one's acquaintance with men and institutions, or broadening one's outlook upon the educational world, though in all of these directions the benefits seem to me to be conspicuous. On the other hand, the prediction that, once the summer school was firmly established, all the colleges and universities would presently be running twelve months in the year, has proved to be quite without foundation. Not even the example of the University of Chicago, whose four-quarter system caused a good deal of quaking among the educational dry bones, has encouraged other institutions to go and do likewise. Even granting that a three months' vacation, spent as many undergraduates and some professors spend it, is an unconscionable waste, the once heralded demand for the redemption of the summer by projecting into it the ordinary habit of the year, makes no headway, nor does it seem likely to do so as long as the work of the summer school continues to be so sharply differentiated, in scope and method, from the regular work of the institution.

What has been done, in substance, is to append to the university, mainly in the interest of those who cannot pursue systematic studies during the rest of the year, a sort of combined extension and normal department, in which elementary courses intended principally for teachers vie with courses for delinquents, a few advanced courses for graduates and undergraduates, and lecture courses for listeners. As a link between the quasi-academic public and the university, and as a means of strengthening the influence of the university in the community, it must be reckoned one of our most important educational agencies. Whether it can go further, and offer in the summer approximately the same kind of educational opportunities that are available at the university during the remainder of the year, is yet to be demonstrated.

Brown University.

NEWS FOR BIBLIOPHILES.

Although Walter Greg's theory as to the origin of the more common Shakespeare quartos, put forth originally in the *Library* of April, 1908, has been denied by some Shakespearean students, the subject still excites the interest of American collectors and bibliographers.

The theory, which was noted in the *Nation* of May 21, 1908, is, briefly, that the nine following quartos, "Merchant of Venice," 1600 (Roberts edition); "Midsummer Night's Dream," 1600 (Roberts edition); "Sir John Oldeastle," 1600 (T. P. edition); "King Lear," 1608 (N. Butter edition); "Henry V," 1608; "Merry Wives of Windsor," 1619; "Yorkshire Tragedy," 1619; the "Contention of York and Lancaster," 2 parts (n. d., but 1619), and "Pericles," 1619, were all printed by Thomas Pavier in the year 1619, bound together, and sold as a collected edition of Shakespeare's works. Of the first four of the above list, there are, it will be remembered, other editions of the same dates. Those editions are proven by the texts to be the earlier and are also very much rarer. It is surmised that Pavier, who already owned the copyrights of five out of the nine plays, surreptitiously reprinted the others, with the old dates in order to have ready a volume which might in a measure forestall the first folio, then under way, though not published until 1623.

George Watson Cole, editor of the "E. D. Church Catalogue," recently completed, has in the Boston *Transcript* of August 25 a two-column article giving a summary of what has been published on the subject. At the Bretton Woods meeting of the Bibliographical Society of America in June Mr. Cole presented statistics showing the relative abundance in collections here and abroad of these quartos. At that time he was able to locate 196 copies of the ten pieces (the "Whole Contention" being considered as two), the lowest number traced of any one book being seventeen copies of the "Merry Wives." Now, by including a few others recently traced in other collections or in the hands of booksellers, and those which have been disposed of at auction since his list in the Church Catalogue was made up, he has increased his total to 222 pieces, the smallest number of any one play being nineteen. He has not included Bishop Gott's set (he had all but "King Lear"), which would bring the total to 231, with a minimum of twenty. It is pretty certain also that Marsden J. Perry had a set, complete or nearly so, before he acquired the Gwyn copy (which alone is recorded by Mr. Cole), and that H. C. Folger also had a nearly complete set before he purchased the Lord Howe collection. We think, therefore, that it is not too much to say that not less than 250 copies of these ten quartos have survived to the present day, and in this number would be comprised not less than twenty-two complete sets. This, by all laws of chance, would almost prove that the books were, when issued, bound together, and so kept until comparatively recent times. Only one set intact, as issued, is now known. That, the Gwyn copy, belongs to Mr. Perry. Another, the Hussey copy, was broken up and the books offered separately at Sotheby's in June, 1906. A third, for about a hundred years in the Library of the University of Virginia, was destroyed by fire in 1895. The Capell copy in the Library of Trinity College is in two volumes, but as they are identical in size, they were probably once bound together. The same is true of the Garrick set, now bound separately, in the British Museum. All other sets apparently have been broken up and the plays widely scattered.

The Bibliophile, in company with Beverly Chew, had an opportunity recently of inspecting the ten plays in the library of W. A. White. With the volumes spread out side by side the similarity of typography was most striking. Similar series of the plays of other authors, as Ben Jonson and Chapman, displayed by Mr. White, show no such similarity. We came to the conclusion that Mr. Greg's theory is more than plausible.

The editors of the first folio probably refer to the efforts of Pavier when they speak of "the frauds and stealths of injurious impostors." That the practice of surreptitiously printing or reprinting books without authority was not uncommon fifty years later, the following extract from the "Orders, Rules and Ordinances of the Company of Stationers," printed in 1678 for the use of members, will show: That no Member or Members of the said Society, shall at any time from henceforth erect, or cause or procure or suffer to be erected any private Press or Presses, commonly called *a Press in a hole,* nor shall countenance or contribute towards the erecting or setting up of any such private Presse or Presses," under a penalty not exceeding fifty pounds. "And for the better discovery of all such private Printing-presses, commonly called *Presses in Holes,*" the discoverer was to receive five pounds.

Correspondence.

THE INSTRUCTOR.

TO THE EDITOR OF THE NATION:

SIR: Amid the chorus of Macedonian cries raised by our universities and major colleges in recent years, I have been struck by the rarity of a word on behalf of the instructor. As one who has himself passed safely through this period, but so recently as to be unable either to forget the pit from which he was digged, or as yet to develop interests antagonistic to those of the instructor, and hence, consciously or unconsciously, to make light of his hardships, I have ventured to give voice to some complaints of many of this class.

The situation now prevailing in our leading educational institutions is briefly this: The higher teaching and administrative positions are in the hands of older men, while the lesser administrative duties and the great bulk of the teaching rest upon the shoulders of young men just out of graduate schools. This system is unfortunate in several ways. In the first place, the mass of students in the major part of their college course come in contact only with callow, inexperienced, and (often through sheer excess of zeal) inefficient teachers. The leading professors are, in the main, accessible only to the few who have had perseverance to continue in the same line of work for several years; or if the younger students ever see the head professor at all, the distinguished man merely harangues or lectures and allows most of the work in personal contact to be done by inexperienced subordinates.

The absurdity of this whole system is manifest. On the one hand, ripened and mature professors, men of national and often international reputation, whose training and experience make them eminently fitted to instruct students, are doing a comparatively light amount of teaching, and then generally in small classes, or else merely lecturing to large ones, while young and immature instructors, with little or no experience, have heavy burdens of teaching, doing all the hard work themselves, and almost always with large classes, often too large for satisfactory instruction of any kind—in a word, the most efficient doing the least teaching work, the least efficient far more than they are capable of doing well.

Bad as all this is for the student, the effect is, perhaps, even worse upon the instructor. In the present cut-throat competition for the higher university positions every man is bound to distinguish himself within the first year or two as a teacher, investigator, or utility man, or as all three. But, instead of every opportunity being given to the tyro to show what is in him, he is immediately saddled with such a burden of teaching that the first year he can do scarcely anything but his class work, and often he glides into the second and third years without finding time for investigation. Even though his teaching hours be not excessive, his direct service to the institution is not bounded by the narrow walls of his class-room and his study—far from it! He is the general handy man about the place to manage the multitudinous administrative details of an academic or semi-academic (when not really anti-academic) nature in our up-to-date fantastically elaborate and complicated educational system. The result of all this is either that he steals time from his classes or devotes to research the precious moments of a few scanty holidays, or else, and this most frequently, he gets discouraged, and gives up the unequal struggle.

Besides this, he is forced to live upon a salary so preposterously inadequate for the service rendered or for anything more than the first brutal physical needs of life, that, if he be married, he is kept in a state of constant anxiety about his pecuniary well-being—a distraction of all conceivable kinds the worst. In our leading institutions the salaries of instructors for the first year vary from $800 to $1,200, and in the course of three to five years you may expect $1,200 to $1,500. Now the peculiar condition of life at universities has raised the standard of living in their proximity to a relatively high level. One thousand dollars will, indeed, furnish food and shelter of a certain kind, but it is, frankly speaking, foolish for an instructor with a family to attempt to live on such an income. The inevitable result is that instructors are forbearing in greater numbers every year to marry at all, or else they have few or no children. An early marriage or a fair-sized family for an instructor is openly regarded in university circles as a serious indiscretion.

And then the crying disparity in salaries! In all our leading institutions the salary of a full professor is at least three times that of an instructor on first appointment, and in many of them four or even five times. But even this ratio is unfair, as the older and more distinguished men have many opportunities for adding to their incomes from lectures, royalties, etc., which, in the very nature of the case, the young man cannot enjoy. Furthermore, this ratio is growing more uneven, and not less so. While the salaries of full professors have, without exception, risen in the past two decades, those of instructors have almost universally remained stationary, or actually been reduced! In one fairly representative institution within the last twelve years the salaries of first-year instructors have been lowered 16 2-3 per cent., while the salaries of full professors have been raised 36 4-11 per cent.

The effects of this financial embarrassment resulting from low salary and long-deferred advancement are simply that the married instructor must himself and his wife suffer hardships (and that there is real misery in university and college faculties any one realizes who knows the facts), or else he must eke out his salary by all manner of outside work, in the much-needed holidays as well as during term time, or by the preparation of cheap text-books that have positively no *raison d'être* whatsoever except to keep some enterprising publisher's press busy and some poor instructor's pot boiling.

Allow me now to suggest briefly some much needed remedies. Let the new instructor have short hours and few courses, and then demand of him that the teaching, for which he has every opportunity to prepare properly, be of high grade, while at the same time he has leisure for productive scholarship, which must also be used to good purpose; and then weed out instantly and without ruth those who fail to take advantage of their chance, and reward generously those who do. But it is repeated persistently: "It is so difficult to tell the capable from the incapable within a year or so." Granted—under the present conditions, which seem to have been cunningly devised by some malign intelligence solely to render confusion yet worse confounded; but—could any better argument be advanced for changing these same conditions?

Among many reasons for the present evils, two are paramount. First, in half-frantic megalomania, the larger institutions of the land have struggled so successfully to increase their enrolment that they have universally far more students to care for than their teaching staff of properly trained men can handle, and, as students always precede endowment, more than they can hire such teachers for at the time. The so-called problem of the undergraduate has already assumed alarming proportions in more than one institution. It is no exaggeration to say that the adequate teaching staff is always ten to twenty years behind the development in enrolment. And what is the object of this? Why, to raise more endowment to attract more students, to raise more endowment to attract more students—*ad infinitum*. To secure an endowment, equipment, and teaching staff in every way adequate to meet the very highest needs of a student patronage already within our gates is little thought of, and even if mentioned is practically unheeded by the wealthy magnates or the legislators who finance our institutions of learning.

For the university authorities are not always to blame. It is a fact sad but true that few wealthy men or local "statesmen" can be persuaded to do anything by way of ameliorating university conditions until the overcrowding of students is patent even to the high-gravel blind. Even should suitable provision be made at one time, before another year the same equipment has become inadequate for the growing classes. Yet for any university firmly to set a limit to further increase in numbers until those it already had were properly cared for, and to refuse to bid or bargain or advertise for more, while content to serve with the highest efficiency a limited number, would be almost enough to make the average American educator doubt the sanity of its administration.

The second reason is the large number of courses offered at one and the same time in our curricula. Most flourishing departments doing graduate work have from ten to twenty (and in rare cases twenty-five or more) courses running simultaneously, which keep perforce a large staff of men all working at the top of their bent. This is sheer wastefulness and nothing less. A mere glance at the list of courses offered in a real university (for example, one in Germany) would be an excellent curative. A comparatively small number of subjects is offered, and these are changed from semester to semester, only a few fundamental courses being regularly repeated. But the whole repertoire of what each man is capable is not displayed in the shop windows all the time; while with us, if all the courses were included in reckoning that are "not given in 1908-9," or perhaps have not been given for years, if ever, and will never be given again if they have ever been given at all, the figures would be almost fabulous. As in a cheap shop, nothing can be taken for granted, so most university and college catalogues, while professing to be both historical and prophetic, are generally either misleading or silly, and usually both. There is simply no need that a student should be able to select subjects at any instant from the whole range of human knowledge. Let him study the first year what the professors are prepared to give, and, if he needs more, let him remain another year, or even longer than that. There is not a particle of reason why our courses of study might not be arranged uniformly in recurring series, giving thus the widest possible range, but making no attempt to cover the whole field at once. Our present irrational scheme seems based on the assumption that the

strength of a department consists in the number of courses offered simultaneously and not in the utmost efficiency of presentation. W. A. O.

August 23.

A PRESIDENTIAL ROAD TO LEARNING.

To the Editor of The Nation:

Sir: There is no subject, not even excepting the tariff, in regard to which the popular mind is so confounded as in regard to "liberal education." This entity is generally admitted to be a good, but if we inquire further what it is thought to be, or how it may be gained, the answer is Babel. This chaos of opinion should now become a cosmos. For now comes the highest educational authority in the country and tells us through multifarious advertisement how we may gain this unknown good almost gratis and almost painlessly. All that we need to do is to purchase the Eliot Library, and devote to its conscientious perusal fifteen minutes per day. If we consume these sixty bottles (and no others) in small daily doses, the most famous doctor in the land guarantees over his signature that according to the best of his belief we shall reach the state of mental health, which is liberal education. The remedy is absolutely democratic; there are no specifications as to age, sex, or previous condition of mental servitude.

So much for the authoritative method by which a liberal education may be obtained. No definition of the term is given explicitly, but a definition is clearly implied in the method, and can easily be deduced from it. In the first place, a liberal education is a sort of by-product. Hereafter no one need concern himself with spending years in its attainment. It is rather a matter of spare minutes; something that can be picked up out of hours, like stenography or Esperanto. A plumber, for instance, can gain it by taking a volume of the Eliot Library—let us say the "Meditations" of Marcus Aurelius—and reading it every day as he rides on the electric car from his shop to the houses where he is to work.

It is interesting, by the way, to note that this view of liberal culture as a by-product has just been expressed by another writer on education. In an essay in the August *Atlantic*, Dr. Homer Edmiston takes the position that culture is an incidental result of vocational training. He says:

> A mind trained along the line of its true development grows and expands as naturally as does a tree planted in the right conditions of soil, air, and sunlight. . . . The craftsman trained to the practice of even a minor art has had a better preparation than the academic student for the appreciation of poetry, because he, as well as the poet, has been touched with the spirit of that "art which shares with great creating nature."

If we accept this view, it follows that even the reading of the Eliot Library is not necessary for a liberal education. But this seems extreme.

To return to the deduction of our definition. Secondly, since liberal education is to consist solely in the reading of books, it must be purely a matter of intellectual acquirement; that is, of learning. We are to read, assimilate, and memorize; since no provision is made for the exercise of the judgment, of the imagination, or of the constructive power of the mind, it evidently follows that these matters have no place in a liberal education. Physical training, the development of the body, and social training, manners, and all that relates to them, are clearly excluded. (We have Arnold's word for it that Milton's Prose Works are not an ideal school of manners.) It is hard to see how any ethical training is to result from the Method, or even any clear ethical precepts. What, for instance, will be the resulting moral ideas of our imaginary plumber, who, after reading the "Imitation of Christ" and Epictetus, proceeds to Middleton's "Changeling," Beaumont and Fletcher's "Maid's Tragedy," and Dryden's "All for Love"?

It almost seems as if Cardinal Newman must have had a prophetic view of Dr. Eliot's scheme, when he said fifty-seven years ago:

> What the steam engine does with matter, the printing press is to do with mind; it is to act mechanically, and the population is to be passively, almost unconsciously, enlightened by the mere multiplication and dissemination of volumes.

It is true that Newman hastens to characterize this as the "most preposterous and pernicious of delusions"; though he admits that "such innocent recreations as science and literature are able to furnish will be a very fit occupation of the thoughts and leisure of young persons, and may be made the means of keeping them from bad employments and bad companions." But, he says, in effect, you must not call this sort of thing education. "Education is a high word; . . . we require intellectual eyes to know with, as bodily eyes for sight." Evidently we have advanced a long way from Newman's position. To make clear how far, let me quote further one of his definitions of liberal education:

> It is the education which gives a man a clear conscious view of his own opinions and judgments, a truth in developing them, an eloquence in expressing them, and a force in urging them. It teaches him to see things as they are, to go right to the point, to disentangle a skein of thought, to detect what is sophistical, and discard what is irrelevant. It prepares him to fill any post with credit, and to master any subject with facility. It shows him how to accommodate himself to others, how to throw himself into their state of mind, how to bring before them his own, how to influence them, how to come to an understanding with them, how to bear with them. He is at home in any society, he has common ground with every class. . . . He is a pleasant companion, and a comrade you can depend upon, . . . he knows when to be serious, and when to trifle. . . . He has the repose of a mind which lives in itself while it lives in the world, and which has resources for its happiness at home when it cannot go abroad.

Comparison of this definition with the one deduced from Dr. Eliot's scheme will give us a convenient measure of the educational progress of the last half-century.

Homer E. Woodbridge.

Colorado Springs, August 20.

PHYSICS AND METAPHYSICS.

To the Editor of The Nation:

Sir: The editorial on "Scientific Speculations" in the *Nation* of August 19 contains the following passage:

> A second danger inherent in the prevalent method is the assumption that the internal, intrinsic, essential nature of matter's ultimate make-up is knowable at all. So far as physics has progressed, it has been by reducing observed phenomena to regular co-existences and sequences. All analogy would seem, therefore, to favor this process rather than to attempt to penetrate into the geometrical shapes of ions, or to discern whether they are spheres or disks, as certain savants in Germany are now trying to do.

Elsewhere the same article, after quoting with approval Newton's statement that he would make no hypotheses concerning the cause of universal gravitation, continues thus:

> But in the matter of light he conjectured that minute corpuscles were flung off from luminous matter—to the retardation of the development of optics for a century.

These passages and one or two others which I will not here quote prompt me to ask a number of questions.

(1.) Did Young and Fresnel in their development of optics a century or more after Newton follow, in their wave theory, a *method* essentially different from that of Newton when he was dealing with light?

(2.) Are light waves to be put into the category of "hypothetical creations" and condemned accordingly?

(3.) If it is true that the inventor of hypotheses is in danger of ignoring "the essential differences between hypothesis and fact, between metaphysics and physics," is it not also true that *a priori* condemnation of speculations concerning the "shapes of ions"—speculations the results of which are speedily put to the test of experiment—is an abuse of metaphysics, this condemnation being based on the general proposition, to which I for one make no objection, that the ultimate, essential, nature of matter is beyond human knowledge? Edwin H. Hall.

South West Harbor, Me., August 22.

[We do not pretend to decide in these high mysteries of science. Our editorial was based on an article in the *Hibbert Journal*, by Prof. Louis T. More of the University of Cincinnati. From him we report the following answers:

(1.) The hypothesis of a wave theory of light is an hypothesis in a most elementary form, a mere expression of one way of transmitting energy. Some such simple hypothesis is probably necessary to interpret observed facts. The special and detailed hypotheses of Young and Fresnel about the character of these waves and the medium carrying them have never withstood any common-sense tests, and are in fact abandoned. Their laws stand to-day and are extraordinarily useful, their hypotheses are failures. It does not appear that their theories of the nature of the ether and the mechanism of etherial waves have led to any discovery which could not have been predicted by other hypotheses, and in my opinion the progress of the science has been retarded by them.

(2.) The expression "light waves," as being a name for the fact that heat energy of the sun reaches us, certainly need not be condemned. But if we identify these waves with any kind of material waves of which we have a sense perception, we get into such difficulties and absurdities that, to say the least, most people, including scientists,

are more misled than benefited. Few things in human thought have been more misleading and more futile than the discussions of the properties of the ether and ethereal waves.

(3.) There is as much necessity and care for embodied angels in the spiritual world as for ions in the material, and speculation as to their shapes is equally profitable for both. One thing physics has taught: that we can never put the "shapes of ions" to the test of direct experimentation.

Ed. The Nation.]

THE JAPANESE SUGAR SCANDAL.

To the Editor of The Nation:

Sir: As a resident in Japan for nearly forty years, and a warm friend of the Japanese people, I wish to thank you for the editorial on the Japanese sugar scandal, which appeared in the *Nation* of August 12. Your appreciation of the swift and apparently even-handed justice meted out by the Japanese courts was a pleasure to read, after the unintelligent and too often carping criticism of Japan, in which many, even of our better papers, frequently indulge.

There was, however, one point regarding which you were perhaps misled by your informant. You state that among the delinquents was the president of the American Board of Missions College, in Kyoto. Strictly speaking, that institution never belonged to the American Board. That board has from the beginning, it is true, given it large aid, both by pecuniary subsidies and by supplying teachers; but the control has been from the first in the hands of a special board of directors. During the first twenty years, or thereabouts, all the voting members of that body were Japanese; but since 1899, three Americans, nominated by the American Board, have been included in the voting membership which has varied from fifteen to twenty.

Mr. J. T. Yokoi, the person to whom you refer, was for a few years prior to 1899 president of the college. The constitution of the college was, however, changed at that time, and he resigned the presidency. Some years later he was chosen a director, and continued to act until his arrest, but he has held no other office. He was greatly beloved by a wide circle of friends, and in spite of the fact that he has not for many years claimed for himself the name of Christian, he has been looked up to as a man of unsurpassed probity.

The pathos of the case is greatly heightened by the fact that Mr. Yokoi's father was one of the most respected of the leaders of the restoration movement of 1868. He died by the hand of assassins before the new government had won its place in the hearts of the people.

D. Crosby Greene.

Scituate, Mass., August 15.

Notes.

Scribners announce that Maurice Hewlett's new novel, "Open Country," will be ready for publication September 7.

Card players who wish to perfect themselves in the newest fad may be glad to hear of a little book by Capt. Browning on "Auction Bridge" (E. P. Dutton & Co.).

On the first of October T. N. Foulis of London will issue five new volumes of The Nietzsche, which is coming out under the editorship of Dr. Oscar Levy. These volumes will contain "Thus Spake Zarathustra," "The Genealogy of Morals," "Human, All-Too-Human," "The Future of Our Educational Institutions," and "The Will to Power."

The autumn and winter list of D. Appleton & Co. contains the following titles: "The Danger Mark," by R. W. Chambers; "Keziah Coffin," by J. C. Lincoln; "Through the Wall," by Cleveland Moffett; "Seymour Charlton," by W. B. Maxwell; "The Star of Love," by F. M. Kingsley; "The End of the Road," by S. P. Hyatt; "The Deeper Stain," by F. Hird; "The Price of Lis Doris," by Maarten Maartens; "An Admiral's Log," by Rear-Admiral R. D. Evans; "Army Letters from an Officer's Wife," by F. M. A. Roe; "The Confidantes of a King—The Mistresses of Louis XV," by E. de Goncourt; "Louis XVI and Marie Antoinette," by Lieut.-Col. A. C. P. Haggard; "Louise Renée de Kéroualle: Duchess of Portsmouth," by Mrs. C. Grant; "The Confessions of a Beachcomber," by E. J. Banfield; "A History of the People of the United States" (Vol. VII), by J. B. McMaster; "Francis Joseph and His Times," by the Right Hon. Sir H. Rumbold; "A History of Jamaica; from Its Discovery by Christopher Columbus to the Year 1872," by W. J. Gardner; "The Secret History of the Court of Spain, 1802-1906," by R. Challice; "The Buried City of Kenfig," by Thomas Gray; "Native Life in East Africa—The Results of an Ethnological Research Expedition," by Dr. Karl Weule; "Around Afghanistan," by Major de Bouillane de Lacoste; "Life and Adventure Beyond Jordan," by the Rev. G. R. Lees; "Rambles in Bible Lands," edited by G. L. Neil; "In the Land of the Blue Gown," by Mrs. A. Little; "A Text-Book for Nursing," by M. F. Donahoe; "Girl and Woman," by Caroline Latimer; "The Junior Republic: Its History and Ideals," by W. R. George; "Double Play," by R. H. Barbour; "The Free Rangers," by J. A. Altsheler; "The New Sophomore," by J. S. Hamilton; "Jesus, David, Joseph, and Moses," stories for children; "The Story of Sugar," by G. T. Surface; "American Business Law with Legal Forms," by J. J. Sullivan; "Elements of Transportation," by E. R. Johnson; "The Southern South," by A. B. Hart; "The History of French Literature," by A. L. Konta; "The Story of Gold," by E. S. Meade; "The Last of the Chiefs," by J. A. Altsheler; "On the Trail of Washington," by F. T. Hill; "In Line of Duty," by R. P. Hobson; "The Red Caps of Lyons," by H. Hayens; "The Man Who Made Good," by Walter Camp; "Louisa May Alcott," by Belle Moses; "Florence Nightingale," by L. E. Richards; "The Adventures of Little Knight Brave," by Mrs. F. B. Rees; "Tales of the Red Children," by A. F. Brown.

Wilhelm Busch, the creator of "Max und Moritz," who died last year, has received from the hands of Dr. Paul Carus a pious little memorial, consisting of a translation of passages from "Eduards Traum," with an appreciatory introduction (The Open Court Publishing Company). Admirers of Busch's light-hearted genius should be warned to avoid Dr. Carus's depressing analysis of humor with unconvincing examples. His attempt to demonstrate that Busch was a great humorist is so totally disinterested that it is prefaced by the candid admission that "his wit is not of the style in which I would indulge if I were a humorist."

Mr. Eugene L. Didier, veteran among students of Poe, has collected twenty-three of his articles dealing with the poet, and has published them, along with a new memoir, in a volume entitled "The Poe Cult and other Poe Papers" (Broadway Publishing Co.). As the author is aware, such a mode of publication involves either considerable editing or, what we find here, not a little repetition. As he is also doubtless aware, the view of Poe presented in the memoir and throughout the volume will not win general assent. Even readers favorably disposed to Poe will wonder how Mr. Didier manages deftly to avoid all mention of certain topics, and will cavil at his superlatives. Nevertheless, there are two reasons for recommending the book. It represents the loving labors of a pioneer student of Poe whose services have not always received due acknowledgment, and it contains anecdotes, poetical tributes, and other material useful to the student and not easily accessible elsewhere. Collectors of Poeana will want it for their shelves and, if they read it carefully, they will discover in it a quality rare in these piping days of peaceful and innocuous criticism. Mr. Didier has strong emotions and is not afraid to express them. What he has to say about a famous Southern university's conduct in inviting an unsympathetic Northern man of letters to deliver an address on Poe may seem to some unduly sectional, may even in its personalities suggest the lurid past of journalism, but will surely give a shock of grateful surprise to all who fancied that refreshing frankness could no longer be encountered in an American book.

Feminine sentiment can do no more for the pickaninny than it has done in Lucy Pratt's "Ezekiel" (Doubleday, Page & Co.). The portrait of Ezekiel is evidently drawn from knowledge, with deep and sincere feeling. He is a little darky who goes to school to a Northern girl-teacher at Hampton; and the education is mutual. The experience and attitude of "Miss North" must be taken to be the author's own. It is a distinctly Northern attitude, self-conscious and sympathetic at times almost to the point of hysteria. Ezekiel is frankly adored and yearned over because he is black, not because he is a child. He stands in the eyes of his creator as type of a down-trodden and misunderstood race. There are moments, to speak the bald truth, when she seems fairly to wallow in the pathos of him. She sees his humor, too, and there is much material for laughter in the record of his exploits and his fanciful narratives. But her chief object is to bring home "the full meaning of a bitter truth—of a childlike, willing, erring race transplanted from the gentle drift of an Oriental country to the stern, exacting West—surrounded there by another people, uncomprehending and impatient." She has, happily, no remedy to suggest save the gradual education of the two races toward a better mutual understanding.

Sir William R. Anson's new (fourth) edi-

tion of "The Law and Custom of the Constitution" (Clarendon Press) has now reached "Parliament." Appearing after the other volumes, it is yet numbered vol. I. The author has embodied the latest practice and precedents, involving pretty large recasting. The marks of this are not always obliterated, as when the index inadvertently retains the form of opening Parliament from the Journals of 1880, while in the text the actual year used is 1906. The author discusses recent changes in democratizing the House of Commons and making it more the instrument of party, in a detached and impartial way, though his own dislike, if not dread, of existing tendencies is scarcely concealed. Himself, as is well known, a leading Conservative member of Parliament, he yet frankly sets down the Constitutional doctrine of the inability of the Lords to meddle with the Budget, in a way that makes against current pretensions of his own party. He writes: "The Commons now regard as breach of privilege not merely the imposition by the Lords of any charge by way of rates or taxes, but any dealing with the regulation or administration of such a charge; and this in measures not primarily financial, but *mainly concerned with social changes*." We have italicized the words which reject the asserted right of the Lords to cut out the tax on the increment of land. Of course, this does not deny their right to throw out the Budget altogether, if they have the stomach to do it and to face the consequences. In Sir William's new preface he expresses indebtedness to only two foreign writers on his subject; one of these is Dr. Redlich, the other President Lowell.

In order to reach a larger number of readers than could afford to buy the first edition of his "Industrial Efficiency," Arthur Shadwell has brought out a second edition in a single volume (Longmans, Green, & Co). The text of the first edition stands apparently unaltered, and the necessary additions and corrections are made in a supplementary chapter of some thirty pages. This deals chiefly, however, with British industrial conditions and legislation from 1906 to 1908. Despite the author's manifest inclination toward protectionism, the work is of the highest value, both for British and foreign readers. In the supplementary chapter Mr. Shadwell observes that Great Britain is rapidly "awakening" under the "stimulus of necessity," and expresses the belief that the progress of Socialism gives no cause for alarm.

Prof. William Denison Lyman of Whitman College, Walla Walla, Wash., in an attractive book of 400 pages, describes the "Columbia River, Its History, Its Myths, Its Scenery, Its Commerce" (G. P. Putnam's Sons), in such a way as to put the world in his debt. The son of pioneers who followed the lead of Marcus Whitman into the far West, he has grown up among the localities with which he deals, and sets forth with the glow of one to the manor born, who at the same time appreciates the finer things, the romance, the natural beauty, and the economic possibilities of the great river. His style is easy and picturesque, if sometimes a bit careless. Occasionally, as in detailing the Lewis and Clark story, we detect some minor inaccuracies in his breezy résumé of the records. But, for the most part, we find him trustworthy, and hold his book to be not only fascinating, but thoroughly studied and packed with valuable knowledge. The abounding illustrations are of a high order of merit, and well supplement the excellence of the text.

The committee in charge of the National Edition of the writings of Giuseppe Mazzini has in press two additional volumes, for which Professor Merighi has written introductions. It is expected that this edition, when completed, will include over sixty volumes. Four have already been issued. The committee has collected over eight thousand published and unpublished letters. Comparatively few belong to the years between 1828 and 1832, since political conditions rendered their possession compromising. It is believed that Mazzini's correspondence with the Ruffini brothers and with Elia Bensa, as well as many other letters which he wrote from Marseilles and Switzerland to friends in Italy, was destroyed. Enough remains, however, to make the new volume five, which embraces this period, of much greater importance than the corresponding volume of the best previous edition, the Florentine. Volume six forms a part of the political series. This edition is issued by the Tipografia Editrice Galeati of Imola.

One of the encouraging results of the exchange of professors between American and foreign universities has been the publication of several works more or less reminiscential in character, or reflecting the observation of the scientific visitor, in one field or another, while abroad. Thus far the Germans, perhaps, have been the most fruitful in putting their impressions on paper, and the latest contribution to the study of American conditions is from Prof. Carl Clemen, who last winter filled the professorship of Dr. E. D. Burton at the University of Chicago. In one of his series of monographs on "Practical Theology" (Giessen: A. Töpelmann), Professor Clemen deals with "Der Religions- und Moralunterricht in den Vereinigten Staaten von Nord Amerika," expressing his belief at the outset that the standard of moral conduct in the United States is higher than that even in his Fatherland, and that, as a result, Germany may learn much of America. Notwithstanding this higher standard of morality prevailing here and generally governing Americans, Professor Clemen did not find as much formal instruction in good morals as he would wish to see; for the American teacher tries to accomplish the results desired by indirect means, and there is a peculiar and unreasonable opposition to specific instruction of a religious character not experienced by authorities in Europe.

The *Dahcim* of Leipzig, No. 40, contains, from the pen of Prof. Dr. Otto Hötzsch of the Royal Academy of Posen, a suggestive article entitled "Studenten Austausch." The author, who speaks with authority—having been once an exchange professor in America and three times one of the docents in the vacation courses for foreign students maintained by the University of Edinburgh—proposes to extend the scheme of exchanging professors by an exchange of students, also, especially between Germany, England, France, and the United States. Dr. Hötzsch recognizes the fact that such an exchange of students would be easier between Germany and France than between Germany and France on the one hand and England and America on the other. The universities and technological institutes of the first two countries are so much alike in their inner arrangements that the advancement of a student in his regular course would not suffer by such an exchange; not so, however, with England and America, where academic ideals and methods are quite different. He, accordingly, suggests, as far as Germany is concerned, that this exchange be for post-graduate work, and that the German government maintain for this purpose an institute in London, just as for scientific research it maintains institutes in Rome and in Athens. He does not wish this exchange to be confined to students of modern languages, but to be extended to all departments of the university.

One of the most instructive and interesting publications in connection with the semi-millennium celebration of the University of Leipzig is the "Leipziger Anthologie," by Gustav Werner Peters, with the subtitle "Gedichte ehemaliger Leipziger Studenten seit 1870." Naturally, it is published as a *Festgabe*. This is apparently the only Leipzig jubilee publication in the department of pure literature, the others being historical in character. In all forty-eight poets are here represented, some of them of recognized standing. Three of these forty-eight are still students in Leipzig.

The tenth volume of the publications of the Irish Texts Society contains an edition and translation by R. A. Stewart Macalister of "Eachtra an Mhadra Mhaoil" (The Story of the Crop-Eared Dog), and "Eachtra Mhacaoimh-an-Iolair" (The Story of Eagle-Boy). Both the texts are modern Irish and are found in manuscripts of the eighteenth century. The tales themselves are of uncertain date. The editor terms them "two Irish Arthurian romances," but they are such hardly more than in name. King Arthur plays, as Mr. Macalister points out, a secondary part in both of them, and the same is true in general of his knights. Even Sir Balbhualdh (identified as Galahad by the editor, though Gawain is probably meant, as Mr. O'Rathaille argues in the August number of the *Irisleabhar na Gaedhilge*) who shares with the Crop-Eared Dog the rôle of hero in the first tale, preserves few individualizing traits, and might as well be almost any other worthy knight of the Round Table, or even a member of the Fenian Troop of Finn and Ossian. Except for the names of a few persons, it is not clear that the stories owe anything to the Arthurian cycle of romances; but it will not be possible to deal satisfactorily with the question of their sources, or to trace the stages by which the Arthurian knights came to play even so shadowy a part in Irish tradition, until more of the early Irish redactions of French and English romances have been made accessible in print. In substance, the tales are typical wonder-journeys, of the sort that Irish literature of all periods abounds in; and, as such, they contain many features of interest to the student of folk-lore and popular tales. The general plots fall at once into familiar categories. The Crop-Eared Dog in the first is an Indian prince who has been transformed by a jealous step-mother, and who undergoes many trials in obtaining restoration to human shape; and Eagle-Boy, in the second, is another prince, the victim of a wicked

uncle by whom his father has been killed and his mother banished, and from whom, of course, he ultimately succeeds in winning back his kingdom.

NOTES ON TEXT BOOKS.

ENGLISH AND EDUCATION.

Houghton Mifflin Co. has started a series of useful reprints under the general title of Riverside Educational Monographs. Six of these now lie before us, slender, clearly printed volumes which sell for only thirty-five cents each: they are "Education, and Other Selections," by R. W. Emerson; "Self-Cultivation in English," by G. H. Palmer; "The Meaning of Infancy," by John Fiske; "Teaching Children to Study," by Lida B. Earhart; "Moral Principles in Education," by John Dewey, and "Education for Efficiency" and "The New Definition of the Cultivated Man," by C. W. Eliot. The plan and form of these publications we can heartily commend. We must, however, register a protest against the awkward English in the introductions of the general editor, Prof. Henry Suzzallo.

J. L. Hughes's little book, "Teaching to Read" (A. S. Barnes & Co.), is rather remarkable among utterances on this subject for its advocacy of rapidity as the proper test of proficiency in reading. "The man who reads only two pages in the time in which he should be able to read three pages is handicapped for life." In accordance with this view Mr. Hughes, who is inspector of schools for Toronto, points out that reading consists, not merely in repeating printed words aloud, but in gaining information from them. Hence, learning to read aloud in the ordinary fashion may not in reality be learning to read at all—much less to read effectively. In connection with this idea Mr. Hughes properly calls attention to the fact which has been too frequently overlooked, that in learning to speak and to read there are involved two distinct sets of processes, which should be distinguished accordingly.

Prof. G. K. Pattee's "Practical Argumentation" (Century Co.) aims in a general way to rescue argument from the kind of intellectual gymnastics to which it has been reduced by the modern methods of teaching debate and to restore it to its proper rank as a form of English composition. The mischief of the recent craze for debating consists in the circumstance that it has inclined more and more to make of argumentation a rigid and artificial methodology without much consideration for its more practical and usual functions as an occasional auxiliary of expression. It is this sort of convention which Professor Pattee endeavors to break through. His volume contains about all that is essential to his subject, and includes a number of suggestions for debate itself, without the depressing formalism which has come to characterize most treatments of the theme.

Under the title of "An Introduction to Poetry for Students of English Literature" (Henry Holt & Co.), Prof. R. M. Alden has just brought out a kind of pendant to his capital handbook of "English Verse" published a few years ago. The names indicate pretty well the different aims of the volumes. Whereas the earlier was historical and, as we like to say nowadays, "scientific," the latter is rather æsthetic and critical. It is for this reason, in part, no doubt, that the "Introduction to Poetry" appears, for all its merits, less satisfactory on the whole than the "English Verse." Not only is the subject more difficult in itself, but the treatment inevitable to a text-book is also bound to make a discussion of poetry as such seem rather jejune and commonplace. At the same time Professor Alden has produced the best manual of its kind in print. He has prudently avoided anything like an attempt at a pseudo-scientific terminology; he has covered the ground pretty thoroughly and with copious references to the most significant critical utterances on his subject; and he has taken space for some discussion of such topics as are likely to be suggestive or troublesome to the student.

"The Hudson Shakespeare" (Ginn & Co.), of which "As You Like It," "Henry V," "Macbeth," "The Merchant of Venice," and "Julius Cæsar" are already in print, has the advantage of an admirably arranged reading page, with the notes at the foot and the important variants immediately under the text, above the notes. The general plan of the work, which has made it so popular a family and school edition in the past, remains essentially unchanged, although the details have been thoroughly modernized. In particular the text itself has been treated more conservatively in accordance with present ideas and brought into closer conformity with that of the First Folio. On the whole, this new edition, to which Prof. E. C. Black and Mr. A. J. George stand sponsors, represents very fairly for the purpose the progress of Shakespearean scholarship.

MODERN LANGUAGES.

"Syntax of the French Verb," by Prof. Edward C. Armstrong, with exercises by Prof. De la Warr B. Easter (Henry Holt), is clear in statement and systematic in plan. Especially commendable are the sections on the participle, gerund, and verbal adjective, on the tenses, and on that shibboleth the subjunctive mood. The exercises, the vocabulary, and the numerous idiomatic and well-translated examples in the text fit the book for use in advanced classes in composition, while the thorough index renders it useful as a work of reference.

"Easy French Prose Composition," by H. A. Guerber (American Book Co.), consists of twenty-five stories in English, to be translated with reference to the author's "Contes et légendes," which presumably contains the same stories in French. In their English form, these are, perhaps inevitably, jerky and incoherent; their morals are somewhat flippant and commercial; and their arrangement exhibits no particular sequence with a view to the development of principles of grammar or composition.

"First Lessons in French," by P. Banderet and Ph. Reinhard, adapted by Grace Sandwith (Thomas Y. Crowell & Co.), is a graded series of vocabularies and exercises, combining the "direct" with the "indirect" or "formal" method. From the beginning, the lessons consist of complete sentences, which are soon combined into more or less interesting paragraphs. The arrangement is such as to cover, in the order of their difficulty, the elementary inflexions and syntax. The rules and paradigms involved in the several lessons are given in appendices.

"Elementary Reader of French History," edited by Freeman M. Josselyn and L. Raymond Talbot (Ginn & Co.), is a text for sight reading. Dry and summary, it nevertheless admits legendary matter like the tale of Roncesvaux and the reply of Cambronne at Waterloo. *Quaere:* Whether the first year students for whom the book is primarily intended will not prefer to read narratives that are possessed of imagination and style.

From Yale comes a reissue of Prof. F. M. Warren's editions of the "Andromaque," the "Britannicus," and the "Athalie" of Racine (Henry Holt). These have in common the same introduction, which gives a brief account of Racine's life, the principles of his dramatic art, and his versification and style. This is followed in each volume by remarks upon the particular tragedy in hand. The notes are also brief, taking much for granted on the student's part. What the student needs most is that his initial prejudices against the *genre* should be overcome. An explicit statement of its differences from the Shakespearean drama with which he is familiar, together with a simple historical account of its rhetorical and material sources in Senecan tragedy and of its critical basis in Renaissance commentaries upon Aristotle, could scarcely fail to help him towards the appreciation of Corneille and Racine.

Heath's Modern Language Series offers three new volumes. "Les Mésaventures de Jean-Paul Choppart," by Louis Desnoyers, edited by C. Fontaine, is a rather dreary picaresque "juvenile," the humor of which fluctuates between the level of Mr. Vincent Crummles and the level of Peck's Bad Boy. This trifle is entirely surrounded by an introduction, notes, a vocabulary, questions, and paraphrases for retranslation. De Tocqueville's "Voyage en Amérique," edited, with introduction, vocabulary, and notes, by R. Clyde Ford, includes the author's "Quinze Jours au désert" and extracts from his letters, together constituting the record of his travels in the American wilderness in 1831. The book should prove interesting to American boys and girls, and may even stimulate them to read the more famous "La Démocratie en Amérique." It is well that they should have an early opportunity to see their country through the eyes of foreigners—especially of sympathetic foreigners, who, like De Tocqueville, nevertheless tell the wholesome truth. "La Princesse Lointaine," with introduction and notes by J. L. Borgerhoff, is an appreciative edition of Rostand's romantic play—the latest treatment of the tale of Jaufre Rudel and the Lady of Tripoli. The introduction sets forth the material, historical and legendary, at the author's command; remarks upon some stylistic qualities of the play, and concludes with a biographical sketch of Rostand. The notes, too, are satisfactory. This edition is none the less welcome for dealing with its text as literature.

"Spanish Anecdotes," arranged by W. F. Giese and C. D. Cool (D. C. Heath), and "Spanish Tales for Beginners," edited by Elijah Clarence Hills (Henry Holt), are selections of easy and interesting material for reading and study. The second book, in particular, is better than its promise; for, besides prose narrative—by Echegaray, Eserich, Valdés, Pardo Bazán, Alarcón, and

others—it offers short poems, with simple notes on Spanish verse. This volume may well fulfil the editor's wish that it "may awaken the student's interest in the civilization of Spain, and . . . serve as an introduction to the study of Spanish literature."

"Deutsche Gedichte zum Auswendiglernen" (Crowell & Co.), by W. P. Chalmers, is a creditable selection of German verse for memorizing. The poems are carefully graded and represent a sufficiently wide range. Considerable pains has been taken with the English notes; and altogether this book should prove a useful supplement to other texts. Goethe, Heine, Uhland, and Schiller are plentifully represented, though, of course, no two persons will agree upon selections for an anthology. For instance, we miss some of the humorous pieces of writers like Heine and Kopisch, which make excellent material for memorizing, and invariably remain longer in the mind than the austere verses to which Mr. Chalmers seems to incline.

"Goethe in Italy" (Holt & Co.) consists of a selection of extracts from the "Italienische Reise" for the classroom. Goethe's prose is by no means easy reading, even outside the classroom. The Germans in prose, as in Greek, are sadly to seek; but Prof. A. B. Nichols has wisely chosen for the present volume the more vivid and human bits of the Italian journey, omitting the geology, botany, and archæology. It is a pleasant arrangement enough for the general reader. What the classroom will say to the 113 pages of text, with only a sparse ten and a half pages of notes we are not very sure. It is Spartan fare, but carefully prepared.

LATIN AND GREEK.

Prof. E. P. Morris has edited the "Satires" of Horace on a commendable plan (Morris & Morgan's Latin Series, American Book Co.). He has restricted comment on grammar and antiquities and devoted himself chiefly to the interpretation of Horace's thought. The summaries of the different satires are fuller than usual, and the general introduction is in the main an analysis of Horace's personality and of the contemporary life that furnished him a world for satire.

The latest addition to Macmillan's Latin Classics is the "Agricola" of Tacitus, edited by Prof. D. R. Stuart. It is well adapted for use in college courses. Professor Stuart is versed in the necessary studies and editions of the "Agricola," and he is the first to utilize for the text the all-important manuscript recently discovered at Jesi. The notes, while touching sufficiently on incidental problems, are not fraught with learning useless to the sophomore. The translations are now and then a shade too colloquial, as the rendering of *mixti copiis et lætitia* by "pooling rations and merrymakings."

One rubs his eyes at seeing an edition of the "Famulus" of Terence (J. Sargeaunt and A. G. S. Raynor, Clarendon Press), and wonders if the Egyptian sands have yielded a new play of the "dimidiatus Menander" as well. Unfortunately, it is merely an expurgated "Eunuchus." The real play was performed at Westminster, throughout the eighteenth century and until 1854, when it was discreetly abandoned. Cardinal Newman prepared a revision with the title of "Pincerna," on which is based the present text by Dr. Gow. It was performed at Westminister in 1907, but we hope it will have no vogue in America. Expurgating Terence is like the task of which one of his slaves tells, washing a brick.

The Clarendon Press has issued Book iv of Thucydides, acceptably edited by T. R. Mills, with a brief introduction, which makes no mention of Cornford or Bury, by H. Stuart Jones. The text is taken from the plates of Mr. Jones's edition of the entire work of Thucydides in the Oxford Classical Series. The reason why the pages of these beautiful and serviceable texts are not numbered should by this time be apparent to excited German reviewers. The price of the book is 3s. 6d.; the notes may be procured separately for 2s.

The translation of the "Rhetoric" of Aristotle found among the papers of Sir Richard Jebb, and now edited with an introduction, supplementary notes, and index by Dr. John Edwin Sandys (Cambridge University Press; Putnams), provides the English reader with a version of that fundamental treatise upon which he may implicitly rely. We have here an interesting illustration of the firm foundations on which the elegant superstructure of Jebb's scholarship was erected. How many young teachers having occasion to lecture on the "Rhetoric" would think it necessary to write out a careful translation of the whole? The work was done in the years preceding the publication of the "Attic Orators," in 1876; and the results appear in the firm grasp of the subject exhibited there and in the masterly article on rhetoric in the "Encyclopædia Britannica." Dr. Sandys, who, thirty years ago was selected, on the recommendation of Jebb, to edit Cope's posthumously published commentary on the "Rhetoric," contributes an introduction based largely on the references to the subject in the "Attic Orators," and explains all literary allusions and variations of text in foot notes marked by his usual sound and copious learning.

HISTORY.

A second volume of "Readings in Modern European History," by Profs. James H. Robinson and Charles A. Beard (Ginn & Co.), covers the period from the Congress of Vienna to the present time, already dealt with in volume two of the "Development of Modern Europe," by the same authors. Naturally, political events are most emphasized, but we note a goodly number of selections illustrative of social and industrial life, and a final chapter on such current problems as the responsibilities of modern government, the warfare against poverty, and the progress and achievements of science.

Prof. James Q. Dealey's "Development of the State" (Silver, Burdett & Co.) should prove, in the hands of a discreet teacher, a serviceable outline for students who are well-grounded in history, and who can supply for themselves the historical illustrations which the extreme compression of the narrative necessarily omits. While Professor Dealey emphasizes the idea that the development of the state conforms to definite laws and principles, which are themselves largely determined by intellectual and economic conditions, he avoids the abstractions which commonly fill so large a place in works of political theory, and on controverted points contents himself, for the most part, with an impartial presentation of the opposing views. Of special interest is his discussion of the electorate as constituting, in a sense, a fourth department of government. Many of the foot-notes and chapter references are cast in an unfamiliar form, and some of them are slovenly.

Profs. James A. James of Northwestern University and Albert H. Sanford of the Stevens Point (Wis.) State Normal School have brought out jointly an "American History" for schools (Charles Scribner's Sons). The distinguishing features of the narrative are a fuller treatment of the later colonial period than has commonly been the case in recent manuals, a careful presentation of the causes of the Revolution, and emphasis upon the growth of the West and upon social and industrial development; while the influence of European happenings on the course of events in America is also pointed out. It is matter of surprise, however, that in a work which seeks to introduce the student to the more usable literature of the subject, the scheme of references appended to the several chapters, should not have been more consistently carried out. We take a single illustration: Why should the bibliography at the end of chapter x, on the causes of the Revolution, refer to the texts of the writ of assistance and the Stamp Act, and not to the texts of the Declaratory Act, the Townshend Acts, or the Massachusetts Circular Letter, all of which are discussed in the chapter and are equally within the grasp of the student? Again, why cite now one and now another collection of documents or source material, without intimation that the sources referred to are all contained in one of the works mentioned? With the present limited development of the school library, the citation of a number of source collections, without indication of the extent to which they duplicate each other, is a discouragement rather than an aid to the teacher. We cannot altogether praise, either, the mechanical make-up of the volume—a matter of consequence in a text-book. The page has a pretty solid appearance, due in part to the absence of paragraph headings; and the lack of distinguishing type in the reference lists is likely to be confusing to young readers. The illustrations are commonplace, and some of the maps too small to read easily without a glass. We note a few errors in the text: "habitans" for habitants (p. 115); "1661," instead of 1761, as the date of the application for writs of assistance in Boston (p. 143); "three" acts, instead of four, as comprising the Alien and Sedition legislation of 1798 (p. 235); and "$500," instead of $300, as the price of exemption under the Draft Act of 1863. On pages 67 and 83 MacDonald's "Select Charters" is cited as though it were a work of more than one volume, which it is not.

SCIENCE.

Messrs. Stone and Millis, having dedicated their excellent "Secondary Arithmetic" (Sanborn & Co.) to the exclusive uses of commerce and industry in terms of emphasis almost shrill, proceed at once to make amends by opening with a chapter devoted to a critico-historical account of notational systems and a philosophical comparison of the decimal base with other bases.

The latest volume of "The Appleton

Arithmetics" (D. Appleton & Co.), by Professors Young and Jackson, is designed for the fifth, sixth, seventh, and eighth grades. It is quite up to date in the character and arrangement of its subject-matter. Its usableness in the classroom is in a measure qualified by a prolixity due to extensive employment of the inductive method, a liberal use of pictorial illustration, and an attempt to preserve the cultural value of the study while fully recognizing the modern conception of secondary arithmetic as a practical art.

Professor Lester's "The Integrals of Mechanics" (Ginn & Co.), is an attempt to mediate between a first course in the integral calculus and a first course in mechanics. If the student could be provided with sufficient time and incentive to read this book prior to entering upon mechanics—and there is the rub—the teacher of mechanics would be thereby relieved from the present annoying necessity of pausing to drill his classes in processes with which, strictly speaking, the subject presupposes familiarity.

The "Trigonometry" (Holt & Co.), by Professor Hall and Mr. Frink, aims to meet the increasing demand of mathematicians and engineers for a treatment of the science better suited to the needs of technological students. The aim is pursued by the introduction of numerous exercises, including many applications to problems of physics and engineering, and by thoroughly treating the arithmetic solution of triangles before entering upon the science proper, namely, the theory of the general trigonometric functions.

"Light and Sound," by W. S. Franklin and Barry MacNutt (Macmillan), is the third volume of the authors' college texts on physics. The statement is made in the preface that America is comparatively lacking in productive scholarship, and the authors believe that, in writing this series of elementary texts, "they are doing as much for the ultimate development of science in America as any of our research specialists." This may be so, but we are reluctant to grant it. A critical comparison of these texts with the best, say of England, shows them to be at least as inferior as is our productive scholarship. The style is inelegant and the construction weak, nor does the treatment of the subject show any peculiar excellence. Mathematics has been almost eliminated, and the difficulties of the science so emasculated that an English student would feel that he was being fed on pap. We certainly hope, for the sake of American scholarship, that this series of texts will not be widely introduced into our colleges.

A rather useful set of definitions, formulæ, and problems for the electrician will be found in T. O'Conor Sloane's "Elementary Electrical Calculations" (Van Nostrand & Co.). The writer attempts to cover too much ground, as he not only gives the ordinary calculations, but also the principles of the subject. He should limit himself either to the needs of the beginner or else supply a dictionary of reference for the more advanced student. The book would be benefited by careful revision, and especially by rewriting the parts on potential, thermo-electricity, and electro-chemistry. In make-up it is not satisfactory, as the binding cracks ominously, whereas a book full of problems should be strongly bound and should open flat.

It is interesting to observe that Prof. Charles Baskerville of the College of the City of New York makes no attempt, in his "General Organic Chemistry" (D. C. Heath & Co.), to preserve a formal logical development of the subject, either inductive or deductive. He simply takes up the topics in the order that seems to him most convenient, and there is no affectation of keeping the student in ignorance of anything he needs because the time has not yet come for him to have it. Molecules, atoms, electrons, symbols, and combining weights come into play in the course of the first two chapters without any flourish of trumpets. Nitrogen and ammonia are taken up after the alkali metals, and the nitrogen oxides do not appear until after most of the other metals and their salts are disposed of. This is an unconventional arrangement, but otherwise no serious objection can be brought against it, for any order is arbitrary, and has its embarrassments. This chemistry is much less bulky than most college text-books, still, if the student gets it all, he will know more than most of them. There are no cuts of any kind. It is true that many of the illustrations in the chemistries now on the market are superfluous or poorly drawn, but that is no reason for leaving them out altogether, for they are occasionally needed. Lantern-slides, briefly seen, cannot take their place. Most teachers, too, will want more exercises than are here given. On the whole, however, this is a useful book, practical, modern, and reliable.

We could not wish a more wisely balanced, better adapted introduction than Edwin A. Kirkpatrick's "Genetic Psychology" (Macmillan). Mr. Kirkpatrick begins with the lowest forms of organic life. He describes the parallel development of physiological build and mental capacity through each of the levels from amoeba to man. The classification and interpretation of instincts are doubtless somewhat more scholastic in their sharp distinctions than the facts allow; as, for instance, when Mr. Kirkpatrick defines the racial (parental) instinct as "a mode of behavior of no advantage to the individual." But in all such instances a contrast of great pedagogical value is secured without doing serious violence to truth. It is strange that Mr. Kirkpatrick, dwelling on the specialized instincts, should give less than a page to the æsthetic group; he is fully alive to its uniqueness as a curious, often dangerous, hypertrophy, but points out not a single illustration of its nature. The second half of the volume, dealing with the functions of human consciousness, takes toward these an attitude of complete philosophical indifference, which few who dip into biology have the self-control to assume. Thanks to this abstinence, Mr. Kirkpatrick's work is free from thin speculation; and perhaps it is for this same reason that he is always direct, matter-of-fact, and singularly prodigal with apt illustrations. A list of references for collateral reading follows each chapter.

The growth of psychology in recent years is reflected in Prof. E. B. Titchener's "A Text-Book of Psychology," the first volume of which the Macmillan Company has just published. This work is a rewriting, and in no sense a mere revision, of the author's thirteen-year-old "Outline of Psychology." From the latter little more has been taken over than the Wundtian point of view, straightforward exposition, and refreshing sanity on open questions. Every topic has been dealt with anew, and many paragraphs interpolated on aspects lately brought into the foreground. Part I, the first of two volumes, covers, besides a defence of the experimental method, only three subjects: sensation, affection, and attention. If any criticism is to be lodged against the increased size, it is that Professor Titchener has served affection and attention with short measure. Not only does he devote an unusual length to sensation, he says four times as much about it as about either of these other mental activities. The fifty-seven paragraphs on various sensation qualities are all the more extensive because, unlike corresponding passages in most other similar works, they eschew nervous physiology altogether. Particularly full is the treatment of the minor sensations; surely not too full in the case of the cutaneous and the kinæsthetic, but debatably so in that of the abdominal, alimentary, circulatory, respiratory, and genital. On the other hand, synæsthesia is rather curtly dismissed, and with it the question of imagery, which raises many fundamental issues clearly and attractively. One may agree with the writer as to the necessity of beginning over again with attention, and starting at the problem of sensory clearness; no less, too, may one assent to his prefatory remark that a discussion of the physiological theories of attention with beginners is wasted time: nevertheless, the tremendous importance of this whole subject on all the rest of psychology (not to mention Pragmatism, Humanism, and Bergsonism) would justify the marshalling of more facts than Professor Titchener has ventured. But if proportions are not altogether to taste, the substance of the book is. The author has sifted out from his book the merely amusing or weird aspects of mental life on which the psychological hack-writer feeds. He successfully presents psychology as a serious science full of hard work and rich in promise of useful achievements.

FLETCHER'S INTRODUCTORY HISTORY OF ENGLAND.

An Introductory History of England: From the earliest times till the year 1815. By C. R. L. Fletcher, M. A., formerly Fellow of All Souls and Magdalen Colleges, Oxford. In four volumes. New York: E. P. Dutton & Co. $1.50 net, per volume.

Mr. Fletcher's work, avowedly compiled for boys and young men, is now completed. For its purpose, the book has extraordinary merits, which are marred by but one fault: Mr. Fletcher is an historian rather than a critic. In common with Macaulay, he lacks something of the judicial faculty; complex natures perplex him. He lives so completely in the times of which he writes, he connects them—in this, too, resembling the school of Macaulay—so closely with the feeling of the century in which he, in fact, lives, that he cannot attain to the ideal impartiality prac-

tised almost without effort by such a writer as Gardiner. We note this defect for two reasons: We wish to deal quite fairly with a writer who has high claims to the admiration of all readers, and a special right to the gratitude of the young, for whom he has provided animated and excellent instruction. We know further that Mr. Fletcher's one fault will attract exaggerated attention among readers who turn immediately to his chapter on the Loss of America. Much that he says is true, but it is no more the whole truth about the conflict between England and her Colonies than are the statements of writers, of whom many are to be found on both sides the Atlantic, who imagine that the whole blame for a contest caused to a great extent by the nature of things may be attributed to the stupidity of George III and the weakness of Lord North. Happily, there is no need for dwelling on the details of a civil war which every man of English descent must now regret. The day has come when in London, as at Washington, the English people can be regarded as a whole. Writers, however, of merit must be judged, not by any quality which they may happen to lack, but by the gifts to which they owe their eminence. Our author's history of England proves his possession of more than one quality which fits him to be the chosen educator of youth.

The essential characteristic of his book is that it is alive—a very different thing, by the way, from being lively. Some of the statements it contains may excite discussion, but there is hardly a line which does not arouse interest. In no part of Mr. Fletcher's work is this quality of interestingness more visible than in his chapter on India. We have all of us admired rightly the boldness of Clive in fighting a huge Indian army of well-nigh twenty times the number of the small force, including only 700 British soldiers, at his disposal. We have many of us felt the victory of Plassey, as commonly described, to be little short of miraculous. Mr. Fletcher, however, gives us Orme's startling account of the military art as understood by Indian princes:

> Orme (he writes) had seen it in working, or rather in failure to work; "the Infantry a multitude of people assembled together without regard to rank and file, some with swords and targets, some with matchlocks of most uncertain fire, some with lances too long or too weak to be of any service." The cavalry is better, but "as each man provides his own horse, it is the interest of the rider to fight as little as possible, for if the horse is killed the owner is ruined. When a chief is killed his followers usually run away at once." As for the guns, we learn elsewhere that if they were fired once in half an hour it was reckoned a feat.

He thus reduces an incomprehensible miracle to the limits of historical fact. But he thereby takes nothing from the interest or glory of Clive's achievement; he rather proves that courage was with Clive, as with other great commanders, grounded on prudence. The English leader triumphed, like a great general before him, *ausus vana contemnere.*

Take, again, Mr. Fletcher's accounts of the Battle of Waterloo. They give us, in the first place, in plain and simple language, the main and essential facts of a conflict which distinctly brought to a close the era of Napoleonic ambition, and, as we now know, has already established well-nigh a hundred years of uninterrupted peace between France and England. But our author here forces the details of a most important transaction upon the attention of youthful readers by falling back with great advantage upon that kind of historical but imaginative narrative of which he has made such admirable use in describing some of the earlier phases of English history. He reintroduces us, we fear for the last time, to the inhabitants of Tubney Manor House, and gives us a picture of the fight at Waterloo as it presented itself to an English officer, and to a private by whom he was followed. The letters, which do not profess to be historical, are yet, we may be sure, grounded on a minute knowledge of facts. They certainly convey an intensely vivid impression, not only of actual events, but of the sentiment of the time in which the imaginary letters are dated.

Mr. Fletcher, in the next place, possesses an historical eye. He seizes at once the striking characteristics of eras and of men. Nothing can be more effective than his account of the true results of the Restoration. They may all be summed up in two statements: The Restoration brought back not only the monarchy, but the Parliament; the Restoration opens the annals of modern England. But these statements, though true, would convey little to a schoolboy. Our author develops and illustrates them so that an intelligent reader may for the first time understand, and will assuredly never forget, the true relation of the age of Charles II to the eighteenth century. One is, indeed, tempted to say that the eighteenth century in spirit began in 1660, and did not, in England at least, end till 1830. This hundred and seventy years is to a great extent governed by one and the same idea. With the fall of the Commonwealth, England passed away from the rule of theology to the reign of common sense.

Mr. Fletcher's personal preferences prevent him from being an absolutely safe guide on questions of character. Still, he hits off the noteworthy traits of great men with singular felicity. We have all, for instance, heard of Marlborough's transcendent military genius. Many readers are acquainted with his acts of treachery and treason, which show that he had yielded, like many other leading Englishmen, to the temptations of a revolutionary period, and, as has been well said, "apparently regarded a treasonable action as not less admissible than a stratagem in war." But few students have probably realized the love for their commander felt by Marlborough's soldiers, or the Duke's care for his troops which begot this loyal affection. This is an aspect of Marlborough's army and of his character to which Mr. Fletcher gives deserved prominence. Consider further our author's summing up of Nelson's character:

> Nelson was the very embodiment and vital force of the Sea Power of Great Britain. His private character was clouded by one insane infatuation for a worthless woman, but it was characteristic of him that he invested that woman with the halo of a saint. In everything but this no life more devoted to the performance of duty was ever lived.

Surely, to any one who accepts, as in the long run we are convinced impartial judges will do, Mahan's exculpation of his hero from the one charge of bad faith, Mr. Fletcher's words must seem an admirable characterization of "the greatest seaman since the world began." It puts the most lovable as well as the most original of England's captains in exactly the light in which one would wish him to be regarded by the generous and the young. His infatuation need not be concealed, but the heroic side of his nature and career should never be kept out of sight.

The "Introductory History of England" is written, as we have said, for boys. The more the book is studied the more clearly a judicious critic will perceive how admirably suited it is for the young. Its author loves the contemplation of striking events and striking characters. He can, indeed, make, and often does make, weighty reflections; in a most interesting chapter, for instance, entitled "Men, Machines, Morals, and Manners," he not only directs attention to illustrations of the so-called industrial revolution of the eighteenth century, but also suggests, what is often forgotten, that in the absence of minute information, and, above all, of trustworthy statistics, many of the bold assertions made about a social change, of which every one can perceive the general character, rest on imperfect knowledge, and are themselves therefore of dubious truth. But his true interest lies in actions and in persons. He is more at home in personalization—if the word may be allowed—than in generalization; and this is exactly as it should be with a writer who addresses himself to Mr. Fletcher's audience. Nor let any one suppose that to arouse the enthusiasm or the interest of youth is nothing more than the providing of a superior kind of amusement. As a matter of

fact, it is biographical history rather than scientific history which has influenced the opinions, the thoughts, the feelings, and therefore, in the long run, the conduct of the young. It would be idle to attribute to Plutarch anything like the insight into the laws of human nature and their effect on the progress of mankind, which any thoughtful reader may without difficulty discover in the pages of Thucydides. But Plutarch's Lives, just because they do not deal with the laws either of human nature or of history, but narrate the actions of celebrated men, have once and again exerted over the imagination and the conduct of the young an influence denied to the earliest and to the latest, whoever he may be, of scientific historians.

CURRENT FICTION.

Anne of Avonlea. By L. M. Montgomery. Boston: L. C. Page & Co.

Readers of "Anne of Green Gables" do not need to be told that the story of the next few years of Anne's life is a story of crystal clearness, of tenderness, humor, and fancy. If the fancy is sometimes exaggerated, it is not in the least morbid, but walks always in lock-step between fun and common sense. To an Anne who has reached the age of discretion and become a teacher in her old school at Avonlea, it is naturally not permitted to be so consistently impossible and so hilarously freakish as in her tender years; nor may she dream quite so recklessly. Accordingly the author, with happy respect to her own forte, provides an orphan boy who is all pranks and a half-orphan boy who is all aerial dreams, and the two supply what was earlier found in Anne.

Anne herself, meanwhile, has by no means wholly graduated from either her imaginings or her talent for predicament. When she is found telling the irrepressible Davy that it is "wrong for little boys to use slang," it seems that Anne must have been changed at rebirth. But again, there are reassuring scenes of catastrophe in respect to mistaken potions which link her joyously with the past. Interest in sentimental adventure naturally waxes, but it does not even yet carry the drama beyond the bounds of youth. As before, the atmosphere of Prince Edward Island prettily surrounds the story.

Drómina. By John Ayscough. New York: G. P. Putnam's Sons.

Mr. Ayscough appears to have yielded to an impulse to sit down and tell sad stories of the lives of kings. First, there is The McMorogh, who was, or thought he was, a King of Ireland, tracing his ancestry back through Irish kings to Charlemagne and Holy Roman emperors, with cardinals and popes for collaterals. Then there is the son of Louis XVI, who, it seems, was hidden from view among gypsies and presently reappeared in Ireland in a camp close to The McMorogh's Castle, Dromina. There is an Irish lady, widow of a French vicomte, who, having made a religion of Louis XVI and Marie Antoinette, now attaches herself to the service of the Dauphin. There is a Spanish gypsy king whose daughter is in contemplation as a wife for the Dauphin, the match diverting itself for good and pretty reasons, while the son of Marie Antoinette marries The McMorogh's daughter. There is a fine lady, lugged into the pages, but quite out of the story, who, it is darkly hinted, has been on intimate terms with Georgian royalty. Following the adventures of this uncrowned group comes the life history of one of the succeeding generation, a grandson of The McMorogh, who takes it into his head to proclaim himself Emperor of Hispaniola, where he has a short and tragic career.

The air of solemn consecration attaching to all these blighted majesties seems almost incompatible with a sense of humor. But there are conversations disclosing a charming Celtic grace and vivacity which make one think how pleasant and witty a book this might become by editing out the royalties. The author has the gift of drawing very winning characters, and allows it such free play that, while one begins by inquiring just why the book was written, one ends by asking why it should ever stop. Generations yet unborn, French, Spanish, Irish, gypsy, might well have gone on laying claim to thrones, Eastern and Western, and dying in martyrdom.

The grateful dedication of the volume to George Meredith, "by his generous permission," is not hard to explain on the common ground of Celtic bias. Merely as a piece of construction, the book might well have been dedicated to Mrs. Nickleby. But it is in essence a fine and high-minded work.

Homespun. By Lottie Blair Parker. New York: Henry Holt & Co.

The author of those popular plays, "'Way Down East" and "Under Southern Skies," has not unnaturally undertaken a study of New England *genre* in the form of fiction. As a successful playwright she could hardly be expected to interpret her subject in the light of the latest observation. The most one could look for would be a respectable rehandling of the familiar types and situations. But the current novel has in some respects moved ahead of the current play. After Miss Wilkins, Miss Jewett, and Miss Brown, it behooves the delineator of New England life to go softly upon his way. "Homespun" makes a rather coarse and sketchy use of the well-worn materials. Its merits and defects are those of Mrs. Stowe's "Oldtown Folks," which was, after all, no more than an early experiment. Here are the village post office and grocery; the sewing society, the surprise party, and the tavern dance; the endless gossip, and the everlasting dialect. Here also are divers useful if familiar elements of melodrama: the innocent village maiden, the virtuous and ambitious village youth, the college-bred sot and villain, the hapless daughter of the publican—you see at once in what species of entanglements these persons are presently to be involved, and (roughly) by what means they are to be extricated. A family quarrel over a strip of land is important to the staging and general action of the piece. We may fancy a canvas and pasteboard "Lilac Lane" as the chief scene of the play which will no doubt be wrought out of the story. Its present dress is that of the utmost literary ingenuousness. Enough to say that of all the inhabitants of "Columbia Corners," few but the hero and the heroine (who appear to have had no special advantages) are permitted the use of respectable English. The speech of the rest is represented by an ingenious system of elision and misspellings: "The' ain't nothin' helps a doctor along like bein' in s'ciety." Even that local magnate and son of Belial, Judge Witherspoon ("Jedge Withersp'n"), speaks uniformly after the manner of Hosea Biglow, or thereabouts. In himself the judge is an interesting person, dialect or no; altogether the most real figure in a story which, with all its crudeness, has its engaging features.

The Cuckoo's Nest. By Martha Gilbert Dickinson Bianchi. New York: Duffield & Co.

A novel the action of which takes place chiefly at Monte Carlo offers well in this hour of cosmopolitan fiction. England, America, France, Poland, and Germany share the honors in providing the principal persons of the tale. Unfortunately, none of these persons are intrinsically important; such interest as they have belongs to them as types. The American abroad, the gambler of noble birth, the courtesan, the brilliant and amorous amateur of the violin, the rude but sportsmanlike Englishwoman with a title, the all-conquering dragoon—these are the not unfamiliar human materials out of which the Countess Bianchi has constructed her plot. Nor is it surprising that we should find the sex-relation, whether in or out of marriage, the dominant theme. The noble French gambler has married an American for love, and we find them, after some years of marriage, still passionately devoted to each other. The wife has become virtually a Frenchwoman, and the feeling between her and her husband-lover is rather that of *l'amour*

than of connubial love as it is understood among English-speaking peoples. Paul breaks the bank at Monte Carlo, as must have been expected, and is subsequently driven to suicide by Vera's jealousy of his former mistress, Hélène. Several admirers stand ready to console her, but we leave her in a somewhat theatrical attitude of erotic grief, vowing eternal fidelity to the spiritual presence (which she images in terms of the flesh) of her dead husband. There are passages of somewhat too detailed description for the taste of Anglo-Saxondom; but the moral of the story is wholesome: that "the way to perfection lies through a series of disgusts." The variety of Continental society here portrayed is eminently qualified to hasten the seeker on his way.

THE KANTIAN PHILOSOPHY.

Kant's Theory of Knowledge. By H. A. Prichard, Fellow of Trinity College, Oxford. New York: Henry Frowde. $2.15.

Fifteen years ago, the great majority of our academic philosophers, in England and America, were wont, with whatever diversities of interpretation, to profess and call themselves idealists. The pendulum of dialectic now, as so often before, is moving to its other limit of oscillation; most of our rising young metaphysicians, as well as some eminent older ones, are making haste to number themselves among the realists; and idealism with them ranks as a passed mode—though by no means as an outworn theme. The "new realism" is second only to Pragmatism in providing the philosophical periodicals with matter. Unfortunately, the protagonists of this doctrine have been more prolific in controversial contributions to technical journals than in substantial books; so that the general public has hardly been informed of this tendency of speculative opinion. Mr. Prichard's volume is, therefore, more of a rarity as a vigorous manifesto in favor of this new realism than as an addition to that multitude, which no librarian can number, of books about Kant's philosophy. The desire to refute the idealism of the author of the "Refutation of Idealism" was plainly the ruling preoccupation of the writer's mind; it has led him to limit his analysis and criticism—as the title does not intimate—to the first two parts of the "Kritik der reinen Vernunft"—the "Transcendental Æsthetic" and the "Analytic." Even such important matters as the examination of rational theology and the antinomies are omitted, except for a superficial and too dogmatic note upon the first antinomy.

Yet, though Mr. Prichard is evidently more interested in realism than in Kant, his book, within the limits chosen, has some singular merits, even as a commentary on the "Kritik"; and in certain ways it should be more serviceable to students of that obscure classic than any existing English writing. It is impossible to conceive of a German's writing such a book on the subject. Mr. Prichard does not so much as mention Kant's personality and historic relations; he omits, without loss, a surprisingly large portion of the Kantian technical terminology; he attempts no general appreciation of the system; but he disarticulates it with an inexorable scalpel, and drags the dark, involved, hypertrophied mass into the light—often the withering light—of a sort of Humian lucidity. The "Kritik" is simply examined to see if it is what it purports to be, a piece of coherent and cogent connected reasoning. Mr. Prichard goes patiently over each point, seeking to determine by a careful scrutiny of the text what, in plain language, Kant may really be understood to mean, and then testing unsparingly the logic of that meaning; crying *distinguo* upon this argument, and *non patet* upon that, with the greatest possible persistency, patience, and cold blood.

Such a frankly non-historical and purely analytic method has its obvious inadequacies; but it has important advantages. For—in spite of the mass of Kant philology—a searching analytic treatment of Kant's argumentation, in a logically competent manner, has been too little in evidence in the Kant books, especially those available in English; the easy-going way in which Kant's actual arguments are ignored, in the interest of a "constructive" exposition, in some well-known writings on that philosopher, is astonishing. In dealing with Kant at close quarters, yet without involution or needless technicality, and in holding that chartered libertine among reasoners fast to the canons of ordinary logic, Mr. Prichard has done good service to Kant study and to philosophy; and his book is, into the bargain, worth reading merely as an example of tenacity and vigor in sequential reasoning.

This may be said without implying that the author's own arguments for realism are entirely unimpeachable. That, however, is a long story, and much ink is certain to be spilt from philosophic fountain-pens before it is all told. It is fair to observe, however, that the "new realism" is in part, though only in part, actually new; it is something more than a mere harking back to an old position. Though reflection, in its secular movement, often seems to swing back and forth from one end of its arc to the other, it does not, after all, do so without modification and enrichment from each of its oscillations.

The Rockies of Canada. By Walter Dwight Wilcox. New York: G. P. Putnam's Sons. $5 net.

It is not the least tribute to the charm of the Canadian Rockies, from the point of view of the hunter, the mountain-climber, the naturalist, or the mere lover of wild scenery, that Mr. Wilcox has found such a wealth of new material to crowd into each succeeding edition of his book as to make it virtually a new work. This is particularly noticeable if we compare one of the earlier editions, say that of 1897, published under the title "Camping in the Canadian Rockies," with the present book. In 1897 the exploration of the splendid peaks and beautiful valleys of this part of the Rocky Mountains was still in its infancy, and was confined to a comparatively small area within easy reach of the railway. Since then under the leadership of such famous mountain-climbers as Whymper, Outram, Collie, Stutfield, Woolley, Eggers, and Wilcox, each year has seen the exploration of new fields, north and south of the railway, until to-day a region more extensive than the Alps is opened to those less ambitious travellers who are content to follow in the footsteps of the pioneers. With all this, however, the explored area is trifling compared to what still remains to be discovered; and for many years to come those who have the necessary time and energy to spare may enjoy the unique charm of scaling peaks never before trod, and in many cases never even seen, by other mortals.

Apart from their interest to the mountain-climber, the Canadian Rockies offer handsome inducements to the hunter and fisherman. The former will find sport worthy of his skill in hunting the big-horn or the Rocky Mountain goat, among almost inaccessible peaks; and the latter may count on a mess of trout from almost any of the little lakes that lie like jewels in the heart of every valley. In some of these lakes the trout reach an extraordinary size. Mr. Wilcox mentions one caught in Lake Minnewanka in 1896, that tipped the scales at thirty-three pounds, but all previous records were eclipsed in 1899, when Dr. Seward Webb captured a fish weighing forty-seven pounds! To the naturalist, the exploration of these mountains and valleys offers an ample reward. From the bottom of the valleys to the snow-line spruce, pine, and larch may be studied in their own peculiar environment; and even the highest valleys harbor some little rodents, such as the pica or tailless hare, which Mr. Wilcox calls the "seven-thousand-foot rat," because it invariably appears at this altitude.

All this, and much more, one finds in Mr. Wilcox's text, but in the end one turns to the illustrations as in many respects the best part of the book. There are forty of these, and one does not need

to read of the endless patience and skill exercised upon each to know that it is almost perfect of its kind. For some of these pictures Mr. Wilcox waited days and weeks, sometimes even years, for the fleeting moment of perfect atmospheric conditions. In them one gets the clearest impression of the great and varied charm of this mountain paradise, from the awe-inspiring grandeur of Mount Assiniboine and the vast ruin of Pinnacle Mountain, to the gentle beauty of Lake Louise and the wonderful landscape of Paradise Valley.

Minnesota, the North Star State. By William Watts Folwell. (American Commonwealths.) Boston: Houghton Mifflin Co. $1.25 net.

Though the American Commonwealth Series has not yet completed its survey of the States on the eastern seaboard, it is already reaching out toward the younger States of the West whose membership in the Union is of comparatively recent date. Minnesota was admitted as a State in 1858, and its history covers a period of but sixty years. Originally under French dominion and occupied at varying times by French explorers and traders, it received during the two hundred years before 1762 no impress of institution, monument, or tradition that has left any trace affecting the life of the commonwealth. Bisected by the line which the Treaty of Paris drew in 1763, it had no territorial integrity until in 1803 it came entirely under English control. Even then the region attracted attention only because it contained the sources of the Mississippi, and not until 1819 did it arouse the concern of the United States government sufficiently to become the seat of a military post, a station not actually occupied until 1822. Twenty-seven years later the Territory of Minnesota was organized, but the events of those years are too slightly related to the subsequent history to be deserving of much recognition in the story of the State's development. For nearly nine years Minnesota remained a Territory, and it was only during this period that the land took on any regional unity.

Even after Minnesota became a State, its history is singularly wanting in events which have played any significant part in the larger history of the nation. Indian wars, so far as they led to conquest and the occupation of territory, are important, and the extension of railway lines and the promotion of educational institutions are essential factors in the opening of the Northwest, but the political struggles and incidents which occupy much space in this book are not constitutionally instructive except as they illustrate the political organization of the frontier. Minnesota has contributed but few men of national repute: Professor Winchell, Ignatius Donnelly, Secretary Windom, Senator Davis, and Govs. Pillsbury and Johnson very nearly complete the list. The share which the State had in the civil war is a noteworthy and creditable witness to the loyalty and bravery of its citizens, and the chapter devoted to this subject is the most readable in the book. The remainder of Professor Folwell's narrative is filled in with tales of grasshoppers, banks, flour mills, missionary work, corporation intrigues, and political jobbery. It is at best but a disconnected chronicle, made somewhat less interesting than might have been the case by the author's failure to discover any organic unity in the State's progress and by his inability to clothe his facts in attractive and graceful style.

Oxford Lectures on Poetry. By A. C. Bradley. New York: The Macmillan Co. $3.

Dr. Bradley so modestly deprecates comparison with his predecessors in the chair of poetry, he is so deferential in taking exception, so apologetic whenever he is obscure or dogmatic, that one lays the book down at the end with a feeling that its author has already sufficiently performed the function of criticism. In the brief retrospect at the close of the volume he touches upon and justifies his special quality as a lecturer upon poetry—a certain bent toward philosophizing, a friendliness toward abstract ideas. This quality gives him as an expositor of Shelley's theory of poetry or Wordsworth's mysticism and paradoxes a distinct advantage over Matthew Arnold, for instance, to whom he is compensatingly inferior in pure poetical tact, in phrase-making, and in the judicial distinction of poetical values. As compared with Mr. Courthope, on the other hand, he appears quite indifferent to that modern type of literary scholarship which concerns itself almost exclusively with origins and influences. He occupies himself immediately with the poetic experience, with the study of the poet's mind through his work, and with the theory of poetry.

In his initial lecture, "Poetry for Poetry's Sake," he comes as near as possible to disposing forever of the interminable quarrel between the Philistine and the artist, the one holding that the subject is everything, the other, that the form is everything. The opposite of the form, Dr. Bradley contends, is not the subject, but the substance, of a poem, and in poetical experience form and substance are one and indivisible. In his little dissertation on "The Sublime" he is less suggestive and less conclusive. Taking issue with Burke, he maintains that terror is not an ingredient in *all* our perceptions of the sublime, instancing a rainbow, a valiant sparrow described by Turgénieff, etc. Here in the misty subjective cloudland of æsthetics one may maintain about what one pleases. We do not feel, perhaps, the sublimity of the sparrow or of the rainbow; we do feel, perhaps, the element of a certain æsthetic terror mingled, in every case, in the rapture of the sublime; and, if we do, we have at least Burke and De Quincey on our side. But all such discussion is at its best rather interesting than conclusive, and one thinks with relief of Pater's advice to the æsthetic critic not to attempt to define beauty, but to live ever in its visible presence. Of the general essays, that on "Hegel's Theory of Tragedy" is the most penetrating, the most perspicuous, and the most instructive. And yet even here, in the presence of the "ethical substance" absolute and its "particular powers," we feel irritated and a little baffled by outworn modes of thought. We could wish that the discussion had been translated into terms of the scientific age for the sake of readers to whom the ideal world is somewhat lacking in solidity.

In dealing with the letters of Keats, with Shelley's view of poetry, with Wordsworth, and with Shakespeare Dr. Bradley is on less disputable ground. He writes as a student and catholic lover of poetry for poetry's sake. Though one may differ from him in matters of detail, one is grateful to him for much stimulating interpretation, and one is kindled by the eloquent yet chastened ardor of his appreciation. His Shakespearian criticism is particularly robust and wholesome; no one has written with more breadth and illumination of Falstaff or with more wisdom and splendor of Antony and Cleopatra. He has no new gospel for the young generation of poets—he believes they must find that for themselves But he is old-fashioned enough to put some faith in the poetic madness, in the validity of the poetic vision, and in reading poetry to receive some indefinable intimations of a world unknown to sense perceptions. Such professors of poetry are becoming rare

---

Benjamin Constant: Der Roman eines Lebens. By Josef Ettlinger. Berlin: Egon Fleischel & Co.

That no complete and trustworthy biography of Benjamin Constant has been hitherto attempted is in a great measure due to the inaccessibility of documents jealously guarded by the heirs of those with whom Constant was closely associated, and who were responsible for the suppression of parts of the *Journal intime*, and for the destruction of many letters. Contemporaries who might have had the courage to undertake a biography distinctly deviating from the biased portrait which Sainte-Beuve had drawn, were hampered by the lack of authentic knowledge. As with other men whose portrait has come to posterity distorted by personal or par-

tisan prejudice, a certain period had to elapse before the character of Constant could be seen in the right perspective. Now, the first biography written from the point of view of a later and juster generation is the work of a German scholar whose translation of "Adolphe" some years ago gave evidence of sympathy with his subject. Dr. Ettlinger's work was in press when Prof. Georges Rudler's work, "La Jeunesse de Benjamin Constant," appeared, covering the life of Constant up to the year 1794, when he made the acquaintance of Mme. de Staël. While both authors base the history of his early development upon hitherto unpublished documents, the book of the German biographer traces it through the critical and important period of his relations with Mme. de Staël to his death in the eventful year 1830.

Dr. Ettlinger emphasizes the German influences that entered into the complex individuality of the man who was called the first cosmopolite in French letters, but he hardly overrates them. Constant's *Fliegeljahre* at the university of Erlangen, his career at the court of Brunswick, his marriage to Wilhelmine von Cramm, his tour of Germany with Mme. de Staël, his marriage with his second wife, Charlotte von Mahrenholtz du Tertre, and the years spent in Göttingen after his rupture with Mme. de Staël, must have left a deep impression. They also brought him into close association with German contemporaries, whose testimony did him more justice than that of his compatriots of the same period, who, by their political creed, were either his fervent adherents or violent opponents. Family documents in the possession of Charlotte's grandson, Baron von Mahrenholtz, and the unpublished letters of Constant to Ludwig Ferdinand Huber, and his wife Thérèse, the daughter of the philologist Heyne and divorced wife of Georg Forster (now the property of Dr. Ludwig Geiger of Berlin), are among the sources that may have strengthened the author's sympathetic attitude towards his subject.

The unfortunate circumstances of Constant's youth were largely responsible for the extraordinary precocity and vanity of the boy. The mother had died at his birth and the father was temperamentally unequal to the task of bringing up the high-strung child. The lack of a home in the true sense of the word made the youth appreciative of the womanly—if not motherly—solicitude of Mme. de Charrière, at whose house in Colombier he was nursed through an illness of several months before he went to Brunswick. Dr. Ettlinger offers no specious apology for Constant and the extraordinary woman whose unselfish devotion to him was not disturbed by his marriage. He does not seem to think that either Constant's family or Sainte-Beuve had reason to be scandalized by the friendship which terminated only when Mme. de Staël appeared upon the scene, and at once became the power of his more mature life as Mme. de Charrière had been of his youth. From that time, the sphere of Constant's activities widened perceptibly. He was drawn into the whirlpool of political life, and the treatise written with her coöperation, "Sur la Force du gouvernement actuel de la France et de la necessité de s'y rallier," roused the antagonism of both Royalists and Jacobins. His direct political work began with his election to the Tribunate in December, 1799, and with few interruptions continued to his death. Apparently inconsistent, it was throughout determined by his adherence to the principles of representative and constitutional government. It was easy to brand Constant a renegade his return from Elba, Bonaparte persuaded his former opponent to become his counsellor. But as the choice was prompted by expediency, so the acceptance was a wise move in the interest of France, which needed at that time men capable of undertaking the task of constitutional reorganization, instead of spending their energies in unfruitful opposition. In a period of rapidly alternating governments and policies Constant showed, according to Dr. Ettlinger, soundness of judgment and firmness of attitude.

His literary work, too, gives evidence of steadfastness of purpose. It was an act of immaturity, no doubt, to conceive at the age of eighteen the plan of a history of the evolution of religion. But Constant returned to the project at various periods of his life, and read the proofs of the fifth and last volume on the morning of his death. Another significant trait of his character is emphasized in the chapter devoted to the autobiographical novel "Adolphe," in the heroine of which the biographer recognizes a Mme. Lindsay, though many incidents of the story are borrowed from his experiences with Mme. de Charrière, Julie Talma, Mme. Trevor, and the main plot is founded upon his relations with Mme. de Staël. Dr. Ettlinger points to the difference between this frank and unflattered self-portrayal and Strindberg's venomous and vindictive "Beichte eines Toren," or the *médisance* of "Elle et lui."

The book justly bears the sub-title "Roman eines Lebens." For although based upon thorough documentary research, it avoids the dry-as-dust manner of the conventional biographer and is as much a piece of psychological interpretation as a record of a most unusual life. The bibliography seems complete and among the illustrations are some that have not before been published.

Social Life at Rome in the Age of Cicero. By W. Warde Fowler. New York: The Macmillan Co. $2.25 net.

Dr. Fowler has attempted a difficult and somewhat novel task, and has admirably succeeded. Following in a way the plan of Dill's "Roman Society from Nero to Marcus Aurelius," he sketches in its various aspects the life that Cicero knew. It is impossible to restrict the treatment absolutely to the times of Cicero; the wealth of material for the following periods—for instance, on the order of the Roman day—tempts Mr. Fowler now and then out of his restricted field, but mainly for the purpose of contrast, and never in such wise as to distort his picture as a whole. Beginning with a brief tour of the city and following therein the order in which Virgil makes Æneas inspect the landmarks of primitive Rome, he treats in successive chapters of the lower population, the men of business, marriage, education, slaves, the house of the rich man, the daily life of the well-to-do, holidays and amusements, religion. Even this outline suggests that the book is not a manual of antiquities of the ordinary sort. The reader who would know the ingredients of the Roman wedding-cake will be disappointed. He will find instead a well-written and suggestive essay on matrimonial conditions in the times of Cicero; it includes a translation, the first in English, of the "Laudatio Turiæ," a record of marital devotion that one might imagine impossible in a Pagan age. This chapter is typical of the book.

The reader will doubtless find most novel the chapter on the Roman business man. Ancient Rome seems modern enough when we learn that Cicero was a corporation-lawyer (acting in behalf of the *socii scripturæ* in Bithynia), drew checks (*perscriptiones*), and took out letters of credit (*permutationes*). High finance, too, was not unknown, taking the form of enormous borrowings on one side, and speculation on the other, as to the value of that blessed security, the future appointment of the debtor as governor of a province; the age of Augustus was in these and other matters one of reform. Mr. Fowler finds the clue to many differences between modern and ancient business conditions in the problem of transportation; thus difficulty of transportation well-nigh necessitated municipal purchase of corn at Rome and other cities.

Interesting also is the treatment of the gradual infiltration of Greek philosophy into the Roman mind, and the compromise formed between the new doctrines and the old beliefs. The contrast between the skepticism of the Ciceronian period and the revival of faith under Augustus is well shown. It is acutely remarked, however, that, despite Virgil's great contribution to the religious

reform of his day, Jupiter never recovered from the treatment he received in the "Æneid," where he appears as a power beneath the *fatum Romanum*. It might be added that if he partly recovered, Ovid finished him in the comedy of his "Metamorphoses."

In one respect Dr. Fowler differs markedly from his predecessor, Dill. While the latter's books include rather elaborate treatments of personalities, in fact read now and then like histories of Roman literature, Mr. Fowler makes his characters parts of his larger plot. Not that he fails to do justice to the important personages of the period. We find brief but vivid sketches of such men as Cælius, Sulpicius Rufus, Varro, and the inevitable Posidonius. Cicero calls for characterization under more than one aspect; in opposition to the harsh school of Mommsen, Mr. Fowler rightly finds the secret of his importance in his ideal of *humanitas*. His estimate of Lucretius is admirable; part of it may be quoted as a specimen of the book:

So far Lucretius may be called a religious poet, in that with profound conviction and passionate utterance he denounced the wickedness of his age, and, like the Hebrew prophets, called on mankind to put away their false gods and degrading superstitions, and learn the true secret of guidance in this life. It is only when we come to ask what that secret was that we feel that this extraordinary man knew far too little of ordinary human nature to be either a religious reformer or an effective prophet. . . . His secret . . . was only a philosophical creed, which he had learnt from Epicurus and Democritus. His profound belief in it is one of the most singular facts in literary history; no man ever put such poetic passion into a dogma, and no such imperious dogma was ever built upon a scientific theory of the universe. He seems to have combined two Italian types of character, which never have been united before or since, that of the ecclesiastic, earnest and dogmatic, seeing human nature from a doctrinal platform, not working and thinking with it; and secondly the poetic type, of which Dante is the noblest example, perfectly clear and definite in inward and outward vision, and illuminating all that it touches with an indescribable glow of pure poetic imagination.

Dr. Fowler in his preface pays tribute to the inspiration of Boissier's "Cicéron et ses amis," and his own work deserves a place on the same shelf. It is a popular book in the best sense of that term.

Valuation: Its Nature and Laws. By Wilbur Marshall Urban. New York: The Macmillan Co. (In the Library of Philosophy, edited by J. H. Muirhead.)

Professor Urban's "introduction to the general theory of value" shows us how a genetic psychology approaches the question which has halted economist, moralist, and art critic. These three, seeking the foundation of all worth in their respective fields, have lost trace of it in the obscure impulses and feelings of the human mind. Professor Urban believes they must call upon the official guide of this labyrinth for assistance. Values, he tells us, can be understood only after we know out of what experiences they have grown and in what others they are felt. This proposition, from which nobody would dissent, leads Professor Urban squarely into introspective analysis. His book describes, with excessive refinement, those elusive shades of feeling and subtle movings of judgment that flit across the mind as it is engaged in setting a value upon something. Clumsy technical language obscures the descriptions (the term "axiology" had to be invented for them!), and they are diffuse beyond mercy. Nevertheless, they reach some decisive results.

Particularly useful to students of psychology are the discussions of Lipps's "sympathetic participation" (Einfühlung) and the "presuppositions of judgment" (Annahmen), which the Austrian school has written books and books about. These vexed topics, though met here only on the oblique, receive fuller attention than at the hands of any other American writer who has come to our notice. They seem, however, to cast but faint light on the theory of value. In the end, Professor Urban returns, after all his wearying microscopical work, to Lotze's familiar doctrine that value is identical with reality and prior to both truth and existence. "Worth experience . . . corresponds to a larger world of reality than the limited regions of existence and truth." These latter predicates "have meaning only when they add to the intrinsic value or reality of an impression or idea." In short, although we must always assume that every value is ultimately intelligible, it is not so for our minds; for the very tools with which we appraise, the logical connections and the sufficient reasons, are themselves valuations. So we fall into a psychological circle which only a "Beatific Vision" can break, "a higher experience in which both contemplation and thought are transcended." That vision must always be the goal of metaphysics. Be Professor Urban's demonstrations what he will—and here we shall not undertake to inspect them—we fear the economist, moralist, and art critic will not feel enriched. For instead of illuminating the criteria by which men estimate market prices, sunset glow, or cowardice, the genetic psychologist simply reads off the symptoms of that state of mind in which such estimates are made, and then springs to their metaphysical implications. If his procedure is worth all its pain, at least its profits do not accrue thus far to others than psychologists.

Science.

Our Insect Friends and Enemies. By John B. Smith. Philadelphia: J. B. Lippincott Co. $1.50.

Dr. Smith is so well known in the world of scientific and practical entomology that his last book is sure to meet a cordial welcome. It is not only his last work, but one may confidently say that it is his best work. It retains the features of thoroughness and accuracy that mark his former publications, and give them such technical scientific and economical value. But the plan upon which the contents have been conceived and are arranged is such as to commend the work to the general reading public, as well as to those particularly interested in the natural life-history of insects, and their economical relations to mankind. The scheme of the book may be outlined briefly as follows: The relations of insects (1) to the animal kingdom; (2) to plants as benefactors; (3) to plants as destroyers; (4) to one another; (5) to the animals that feed on them; (6) to weather and diseases that affect them; (7) to other animals; (8) to man, as benefactors; (9) to man, as carriers of disease; (10) to the household; (11) to the farmer and fruit grower; with, finally, (12) a chapter on the "War on Insects." The last theme is of high practical interest and value to those whose unhappy experience compels them to defend their orchards, vineyards, gardens, and grounds from the hordes of insect enemies. A considerable part of Dr. Smith's facts have been personally observed in the course of his long career as an entomologist, and all are based upon the observations or records of scientific investigators. Almost necessarily there is some overlapping of the various sections. But this point has been well guarded, and one is not conscious of repetitions or mere padding.

One often comes across statements that cause hesitation, and start one to thinking, and even to questioning. For instance, what a field of reflection opens before this remark:

Some species of insects do such incredibly stupid things occasionally, that it would be a libel on instinct to charge it with such actions. And often *specimens of the same species* will do things so differently that individuality and ratiocination must be accepted as accounting for the difference. To be sure, it is not a very high grade of intelligence that is manifested, using our own attainments as a standard; but it is such a grade as brings out the difference between individuals and species, and enables one to do well what the other fails in, habitually.

That there is a wide difference between insect orders, genera, and even species in the seeming intelligence with

which the various conditions of their life are met, will not be questioned by entomologists. But that like differences obtain between the *individuals of the same species*, as thus asserted by Dr. Smith, as in the case of man and higher animals, is something that gives one pause. Again, it doubtless goes against the widely popular opinion of the relations of birds to insects to read (p. 135) that, as against the common insect pests of the farm, the field, the orchard, and the garden, neither birds nor other vertebrate animals are of the least practical benefit, and that the farmer and fruit grower would be no worse off if every insectivorous bird and other animal were killed. Yet our author, nevertheless, is careful to encourage the belief that these vertebrates do constitute a useful and important check to many injurious insects that otherwise would be more abundant than they are. That theory, at least, breaks the arm of our dependence upon natural protectors against insect pests, and throws us more completely upon artificial defences, which is doubtless the safer way.

The injuries inflicted by insects upon man are fully exhibited in Dr. Smith's book, and everywhere he has an eye to the remedies therefor, as one would expect from his position as an economical entomologist. But he does the little creatures justice in showing their immense benefits to our race in fertilizing flowers, fruits, shrubs, and trees, many of which without such agency would not reproduce their kind; in disposing of waste and decaying matter, as universal scavengers; and in shifting the soil of the earth, and adding to its richness by reducing dead wood to powder and giving it back to the soil in available shape for use. It perhaps strikes the ordinary reader as unreasonable to believe that such little creatures should produce such great results. But if one considers that the number of known species of insects is over 200,000, and that there are probably as many more yet undescribed; and that most of these species continually produce countless hordes of individuals, their power for good or for evil will seem far from insignificant.

The publisher's work merits commendation. There are 121 cuts, most of which have several figures, making several hundred in all. A good many of these will be recognized by those who are familiar with Dr. Smith's "Economic Entomology," and with the publications of the Agricultural Department. But they are all good and appropriate.

"Sahara Soudanais" is the title of the second volume of the "Missions au Sahara," just published by Librairie Armand Colin. It treats of the region between the Niger and Lake Tchad, the life of the people and its relation to their physical conditions, the climate, plants, and animals and their dispersion, and the Saharaian commerce and its future. The observations show that, contrary to the general belief that the desert is extending into the Sudan, the great development of the vegetation on the fossil dunes is bringing into fertility regions recently absolutely desert.

D. Appleton & Co. announce for publication in the near future, "Aerial Navigation," by A. F. Zahm; "Periodic Law," by A. E. Garrett; "A History of Birds," by H. O. Forbes; "The Modern Science of Language," by H. C. Wyld; "Psychology and the Teachers," by Hugo Münsterberg; "Bird Hunting Through Wild Europe," by R. B. Lodge.

Germany has a new Academy of Sciences, the first one not founded by a government, but by private munificence. It has its headquarters in Heidelberg, and its establishment was made possible by a bequest of one million marks from Heinrich Lanz, the late manufacturer of Mannheim. The academy will consist of two classes, one devoted to research in the department of mathematics and natural sciences, and the other to philosophy and history.

A unique and very imperfectly explored corner of our country is described by Mr. W. C. Mendenhall, of the Geological Survey, in the *National Geographic Magazine* for August. It is the Colorado Desert in Southern California, and his graphic account, together with the remarkable photographic illustrations, give one a vivid impression of what was originally one of the most desolate spots on the globe, a veritable furnace in midsummer, but now destined through the agency of man to become an agricultural region in which products incapable of production elsewhere in the United States can be successfully grown. Among its peculiar features are mud volcanoes and gorges 200 feet deep and yet scarcely wide enough at the bottom for a man to pass. Mr. H. M. Smith, deputy commissioner of fisheries, contributes an instructive article on the sea herring—the world's most valuable fish—in which he gives the methods of fishing and the amount of the annual catch in the various countries, the industries it supports, and the part it has played in history. "Its spawning and feeding grounds have determined the location of cities," and it was a prime factor in the overthrow of Charles I, while the famous "Battle of the Herrings," fought at Orleans, immediately preceded the raising of the siege, her first chosen task, by Joan of Arc. The annual product is about two and a half billion pounds, valued at $60,000,000.

"Life's Day, Guide-Posts and Danger-Signals in Health" (Frederick A. Stokes Co.) is the outcome of a course of lectures delivered by Dr. W. S. Bainbridge at Chautauqua. He seeks to give general advice on the conduct of life according to periods designated as "Dawn," "Morning," "Midday," and "Twilight," some of which are rather vague in their limits. "Dawn" is perhaps the best chapter in the book, and treats of infancy rather than the strictly auroral or prenatal period of existence, which is partially and rather superficially provided for in an introductory section on heredity and environment. The advice is generally good and the book ought to help many of the class for which it was written.

From Vienna the death is announced, in his fifty-second year, of Alfons Edler von Rosthorn, professor of gynæcology in the university of that place. He wrote many treatises and articles on his specialty.

From Copenhagen comes the report of the death of Emile Christian Hansen, the botanist, in his sixty-seventh year. He had worked particularly in the field of fermentations, and one of his publications was on the "Morphology of Alcoholic Ferments."

Drama and Music.

To Mr. John S. Farmer, the general editor, and to T. C. & E. C. Jack, the publishers, we are indebted to two new issues of the superb Tudor Facsimile Texts, bringing the total number of volumes now in the hands of subscribers up to forty-nine. Of the new issues one, of four volumes, completes the Enterludes of John Heywood, giving us "A Play of Love" from the impression of 1533-4; "John John the Husband, Tyb his Wife, and Sir John the Priest," from the 1533 edition; "The Play of the Weather," 1533; and "The Pardoner and the Frere, the curate and neybour Pratte," 1533. All these are photographed from the originals in the Pepysian Library at Magdalene College, Cambridge, and in the first of them is reproduced the portrait of Pepys pasted in the book no doubt by the genial owner himself. The other issue is of three volumes diverse in character. One gives "The Story of King Darius," from a copy of Colwell's edition of 1565, at Magdalene College. Another edition of this play, Hugh Jackson's of 1577, has already been reproduced in this series. The second volume contains "The World and the Child, otherwise Mundus & Infans," from a copy at Trinity College, Dublin, of Wynkyn de Worde's edition of 1522, the play itself probably dating from 1500-6. This is the first time it has been reproduced in facsimile, and indeed properly reproduced at all, for neither Hazlitt's nor the present editor's earlier reprint was accurate. The third volume contains "A Contract of Marriage between Wit and Wisdom," from the manuscript copy dating about 1579. The original is in the British Museum, and has never before been printed. As usual, all these reproductions have been collated with the originals, and assurance is given that in very few minute points is anything lost in the process, whereas in many points the photograph is actually the clearer of the two. As we have remarked before, the value of this series is enormously increased by its continuance. A single volume would be merely a curiosity; but as a considerable part of these early plays is brought out, opportunity is given to scholars all over the world to study the beginnings of the drama with the same certainty, so far as the series carries them, and with more convenience than in the great libraries of England.

Briefwechsel zwischen Franz Liszt und Carl Alexander Grossherzog von Sachsen. Herausgegeben von La Mara. Leipzig: Breitkopf & Härtel.

In 1841, Liszt appeared for the first

time at Weimar; he was thirty years old and aroused unbounded enthusiasm by his playing, both in public and at court. The following year, he was invited to participate in some aristocratic marriage festivities in the same town, and, on this occasion, tho leaves were turned for him by no less exalted a personage than the Grandduchess Maria Paulowna, sister of the Czar Nicholas I, and mother of Augusta, who subsequently became the Empress of Germany. It was nothing new for the petted pianist to be thus adored and honored, but this time the homage assumed the form of a request, the consequences of which affected the history of music seriously. Liszt was asked to accept the title of Grandducal Kappellmeister and to devote three months of his time every year to musical activity at Weimar; and he consented. Thus it came about that this city became for the musical world what it had been for the literary world in the days of Goethe, thanks partly to Liszt, partly to Carl Alexander, who became Grand Duke in 1853, and whose great ambition was to make Weimar once more the centre of German intellectual life. His ideals were liberal and progressive, and he loved to gather about him men like Häckel, Kuno Fischer, Georg Ebers, Hermann Grimm, Bodenstedt, Gustav Freytag, with foreigners of the same rank, beside all the great musicians of the time, who were attracted by Liszt.

Carl Alexander soon discovered that the greatness of Liszt as a musician was owing largely to his magnetic personality and to an intellect which had keen insight into many other things than his chosen art. He begged Liszt to correspond with him when away from Weimar: "Compensate by your letters for the privation your absence inflicts on me"; and when Liszt complies, he writes: "I cannot tell you how delighted I am to find you in your letters the same man I have learned to know and to love in conversation." Thus began a correspondence which lasted from 1845 to 1886, resulting in 203 letters, most of which are given to the world for the first time in this volume. They are printed as written, in French, but the footnotes and the introduction, by the indefatigable La Mara (Marie Lipsius), are in German.

In the earliest of these letters, we catch glimpses of Liszt on his triumphal tours. In the first of them, dated at Cadiz, he dwells on the difficulties encountered in a country which, up to that time, no pianist of high rank had ventured to visit. Already, however, he is beginning to think of other spheres of activity than the keyboard. In 1846, he refers to the rumors that he was to succeed Donizetti as conductor of the Imperial Opera in Vienna, and protests against the version that he had applied for that position: "All Vienna knows perfectly well that I do not apply for anything that could look like a position, but that quite naturally and simply Liszt must be a candidate spoken of in Austria provided that he has shown for such a post more ability and talent than others." In the same letter, he declares that thenceforth touring as a pianist is to be a subordinate part of his career: "Above all other things, my aim at present is to *conquer the theatre for my ideals*, just as I have during these last six years conquered with my personality as an artist." Weimar soon offered opportunities for this conquest of the theatre; under his direction, the opera in that city became a sort of preliminary Bayreuth; and more than Bayreuth from one point of view, for the operas of other struggling composers besides Wagner were there presented for the first time. Indeed, in 1859, he declared that as Wagner's operas had now taken their place in the regular repertory of the theatres they no longer needed his aid.

He had enemies who spoke sneeringly of the new works he was constantly staging as "experiments." The public did not always come to his rescue, notably in the case of Cornelius's "Barber of Bagdad," which was a complete failure. This fiasco, combined with the insufficiency of the means placed at his disposal in some cases, and the impediments to his marriage with the Princess Wittgenstein, induced him to give up his position at Weimar, without, however, causing a break in his friendship with Carl Alexander. Nine years later, when Liszt again lived at Weimar, the Grand Duke sent him one day a note beginning:

> To the devil with women, especially those that are beautiful in your eyes and amiable. They take you away from me.

In several of these letters Liszt talks freely about the heart wounds caused by the delay in the divorce proceedings of the Princess Wittgenstein, and the various difficulties placed in the way of his marriage to her after her husband's death. He finally accepted the inevitable and went to Rome in order to reform church music. But the Romans preferred their music as it was, and Liszt continued, as he had done all his life, to compose chiefly for his own satisfaction. Regarding his critics he writes to the Grand Duke:

> The unfavorable comments on my compositions would give me encouragement in case I needed any, for one does not, even in case of partisanship, attack unimportant works with such acrimonious violence.

Unfortunately, he does not often accede to his correspondent's request "parlez moi de vos traveaux." A quarter of a century after the Grand Duke had made this request he had to write: "I resign myself to seeing you always occupied more with others than with yourself, your character being made that way." Liszt has a good deal to say about Wagner and about his projects for the "Fondation-Goethe à Weimar," which was to assist unknown artists, as also about Saint-Saëns, and other composers. Of Rubinstein he gives this vivid sketch (1869):

> He needs at least two years of concert tours to amass a capital of two or three hundred thousand francs, which he deems requisite for his artistic independence. His successes as pianist no longer have any importance for him except in so far as they increase his receipts; apart from that he would snap his fingers at them, for his master passion is elsewhere. It is the ambition, ardent, obstinate, proud, almost exclusive, of attaining the rank of a great composer. He has the gifts for it, the *allure*, the means, the temperament, but perhaps also a little too much conscious purpose and haste. His fiery temperament urges him on to excessive productivity; he suffers from the incontinence of his musical genius, which would fain encompass Meyerbeer and Mendelssohn, even adding Beethoven, plus Rubinstein himself.

"Music, Its Laws and Evolution," by Jules Combarieu, is listed for publication by D. Appleton & Co.

"Old Irish Folk-Music and Songs" is the title of a collection of 842 Irish airs and songs not printed heretofore. They are edited, with annotations, for the Royal Society of Antiquaries of Ireland by W. P. Joyce, and published by Longmans, Green & Co.

Dr. Hugo Riemann, the leading musical historian and theorist of our time—in fact, of all time—celebrated his sixtieth birthday on July 18. To musicians in general he is best known as the author of the admirable "Musik-Lexicon," of which seven editions have already appeared, and which is unique among encyclopædias, inasmuch as every article in its 1,500 pages bears the stamp of his individual judgment, style, and original research. Dr. Riemann is the reverse of a compiler; he accepts nothing on faith, but labors indefatigably to trace facts to their sources; and these sources, especially in the history of mediæval music, are often very obscure, requiring rare detective ingenuity to discover them. With the industrious habits of a German professor he unites the lucid, incisive style of a brilliant man of letters. He has thrown new light on every branch of musical theory (of which he has also written a history); has composed a considerable amount of chamber music, songs, and piano pieces; has written unsurpassed treatises on harmony, fugue, and counterpoint; has devised a system of phrasing which has aided thousands in their efforts to interpret music eloquently as well as correctly; has coined as a correlative of "dynamic," the useful new word, "agogic," relating to those slight modifications of pace which are usually stupidly called tempo rubato; in short, there is hardly an aspect of music which has not been touched and illuminated by his authority. On the younger generation of musicians he has exerted an incalculable, salutary influence, partly through his gift of elucidating obscure problems, partly

by his liberal, unbiassed views, as set forth particularly in his history of music since Beethoven, in which the composers are viewed in a new perspective, and for the first time deserved prominence is given to Schubert, Chopin, Wagner, and Liszt.

The death is reported, in his sixty-third year, of Sigismund Noskowski, director of the Music School of Warsaw. He was the inventor of a system of notation for the blind.

Art.

Greek Buildings Represented by Fragments in the British Museum. By W. R. Lethaby. London: B. T. Batsford; New York: Charles Scribner's Sons. $4.20 net.

From this title the reader is led to expect either a full account of the Greek buildings of which the British Museum owns fragments, with a clear exposition of our present knowledge, or a series of articles setting forth original theories and fresh information regarding these monuments. A book of the first kind might have been an invaluable companion to the classical student in London; one of the latter would have deserved the attention of all archæologists as a discussion of questions, the importance of which makes every new contribution of value. Mr. Lethaby's book satisfies neither of these expectations. In fact, it is difficult to see why the book was written, or rather published, at least in this form. There is no full treatment of any one of the buildings discussed. The information is presented more or less at random without any definite plan of selection. In some cases the author starts systematically, giving the date, plan, and construction of the building; in others he neglects to give any introductory notice whatever, beginning immedlately on the discussion of some special point. Well-known facts are advanced, as if for the first time; references to other publications are not frequent, and there is a general preference for out-of-date books. Together with this old material, some new theories are set forth, but these are not properly digested and little attempt is made to prove them in a scientific manner. The whole volume makes the impression of being in the form of rough notes on points that happen to have interested the writer, intended to be worked out properly later. If Mr. Lethaby had separated his original suggestions—such as his theories about Cecrops in the Western pediment of the Parthenon, the column of the chryselephantine Athena of Pheidias, the temple of Rhamnus, the plan of the Mausoleum—from the rest of his material, had worked them out carefully and published them in the form of an article in an archæological or architectural journal, his contribution to archæology might have been of more value.

As is natural in a book of this sort, misstatements are frequent, and the serious student must be warned against them. The following are only a few. On page 155 Mr. Lethaby says: "This kind of doorway [with a sunk band for a bronze-covered frame] may be taken as a general rule to show that a building is earlier than the Erechtheum," forgetting, apparently for the moment, that the Erechtheum itself had one of these very doors on the east side! On p. 164 the statement occurs that "we know from the building inscription that the east door [of the Erechtheum] had consoles." As a matter of fact, the building inscription gives us no such information. It merely says that a half-worked console, destined for the east wall, was on the ground near by. Now, since the windows on the east side had four applied consoles, the console mentioned may well have been one of these (see G. P. Stevens's article in the *American Journal of Archæology*, 1906). Special attention must be drawn to a curious slip on p. 202. Figure 210 on that page shows the well-known porphyry shaft, probably a portion of a lamp decorated with a leaf pattern which was found by Dr. Arthur Evans at Knossos, and is now in the Candia Museum, Crete. The British Museum owns a cast of this shaft; it used there to be placed, with other Cretan reproductions, in the Early Vase Room in a case containing Mycenæan finds from Enkomi, Cyprus. Mr. Lethaby, evidently little familiar with the Cretan material, has taken it for granted that this shaft also came from Cyprus, and publishes it as such here. These reproductions have now been placed with other Cretan material, so that such mistakes will be impossible in the future. Characteristic of Mr. Lethaby's method of disposing of archæological problems is his remark a little further down (p. 203) on the fresco of a shrine from Knossos, where he summarily refers to the famous "sacred horns" found in such numbers in Crete as "altars."

"Notes on the Science of Picture Making," by C. J. Holmes, and "Fresco Painting, Its Art and Technique, with Reference to the Buono and Spirit Fresco Methods," by James Ward, are among the publications to be issued by D. Appleton & Co.

The Liverpool committee for research in Wales and the Marches (founded 1907) have issued their first annual report. Though eager to put the spade in the ground, they are persuaded that discretion is the better part of valor, and their work for 1908 has been limited to the conduct of a preliminary survey of a few districts, which have not yet been explored by any local society, and to tentative excavations on sites which seem likely to deserve more thorough examination in the future. Professor Haverfield and Professor Bosanquet have devoted such time as they could spare to investigating the smaller Roman forts, of which twenty or more are known in Wales and the Marches. Mr. George Clinch has examined the region round Cader Idris bounded by the rivers Maroddach and Dovey, and Mr. Hugh S. Kingsford has done some good surface work along the coast of Carnarvonshire and in Anglesey. The two last have furnished illustrated descriptions of their work. Such excavation as has been carried on has been mainly confined to the graveyard at Caerleon, Monmouth, and has been supervised by Mr. Evelyn G. White and the Monmouthshire and Caerleon Antiquarian Association.

In that eternal struggle between the inner vision and the external fact which is the life of the artist there are many failures, who interest nobody. There are, also, three classes of men who succeed, partially or wholly. They are the men of little or no imagination, men of eye and hand, of whom the consummate type is Frans Hals; men of that type to which Laurence Housman has recently confessed that he belongs—artists who are put out by nature and can body forth their vision only by neglect of everything else—of whom Blake is the highest example; and the great masters, whose imagination is true enough and strong enough to be helped rather than hurt by the contact with nature, and who are able definitely to realize their ideal. It is the artist of the second class that is apt to be the favorite of the literary critic, and is labelled specifically "an imaginative artist" because he is so evidently nothing else. One of the weaker brothers of this sort was Simeon Solomon, a Burne-Jones without the pictorial ability, to whom Mrs. Julia Ellsworth Ford devotes a monograph published by Frederic Fairchild Sherman. The illustrations are, for the most part, reproductions of crayon drawings of heads, single or in groups, and there is nothing of that earlier work which we are assured was the artist's best. What we get is mildly interesting but feeble, possessing a certain intensity of expression, but nothing more.

Finance.

A FALL IN STOCK EXCHANGE PRICES.

A sudden break on the Stock Exchange, running so far, in the more active stocks, as 6½ points in shares of the Reading Railway, 7 in New York Central, 9 in Southern Pacific, and 13 in Union Pacific—all this within little more than a week—sets the wits of the financial community at work. It is characteristic of the Wall Street wing of that community that it should ignore the obvious explanation. Not to mention other speculative stocks, Reading had previously advanced 48 points from last spring's price, New York Central 27, Southern Pacific 24, and Union Pacific 46. This was a reasonably rapid enhancement of values, even with an improving industrial situation to "discount." When, furthermore, conservative observers had been warning the public that prices had risen unreason-

ably high, that they were kept up by borrowed money which must largely be surrendered in the autumn, that numerous predictions on which the rise was based had not been fulfilled, and that even a most brilliant future had been "overdiscounted," a fall in prices such as has been described was scarcely illogical. Perhaps, after all, the factor of "Harriman's health," which Wall Street prefers to assign as the single cause, did not play the part that Wall Street imagines.

The market's action suggests some other considerations. It may be safely said that very rarely has a sudden fall in values created so much uneasiness in Wall Street, and so little anywhere else. There are occasions when merchants and manufacturers shake their heads apprehensively when they see the row of large figures with the minus signs in the stock table of their evening paper; but no one encountered that sort of doubt and mistrust on this occasion. Nor, on the other hand, were the 10 and 12-point declines in active speculative stocks greeted by the wail of distress, from Wall Street's "outside public," which followed the similar declines of May, 1901, and December, 1904. Demands for summary vengeance on the evil men who had lured the virtuous outsider into speculations which went wrong, and grave moralizing on the abuses of Wall Street itself, made up much of the conversation, and much of the newspaper editorials, of the week or so following those episodes. No one heard them during the recent break in prices.

The natural inference would be, that the "outside public" was not caught on this occasion, and the inference happens to square with certain indications visible during the progress of the speculation itself. There can be no great doubt that the authors and managers of the extravagant "boom" in prices, this past summer, reckoned with confidence on a runaway market under the outside public's auspices, when the tariff bill should become a law. It is an old story now, to what extent all predictions of the future, earlier in the year, were based on and timed to that event. Shall we be prosperous? We certainly shall—as soon as the tariff bill is passed. Will stocks go up? There will be a memorable advance—when Congress is through with the debate. It is not in the least improbable that the authors of these curious prophecies, beginning with an effort to convince the general public, ended by convincing themselves. And it must be said that even logic and psychology went to confirm the inference that a financial public which went crazy over the election of last November ought to have been inspired to equal madness by the fulfilling of the condition precedent set by Wall Street authorities on the present occasion.

But the public is a curious being. Its action last November took High Finance completely by surprise. High Finance thereupon revised its expectations for the next occasion of the sort; but the fickle public contributed another surprise by doing exactly the opposite of what it did last autumn. This behavior, which was freely commented on when the tariff debate had ended, perhaps explains why, four or five weeks after the tariff bill's enactment, outsiders have been watching the heavy break in stocks as calmly as they might watch a melodrama, while the signs of discomfort and uneasiness appear in the Wall Street quarters which by the programme were to have been by this time in so very different a position.

BOOKS OF THE WEEK.

The Best Book On 6% Bonds

We have written a book on Irrigation Bonds, based on long experience and intimate knowledge. Every investor, small or large, owes to himself its perusal. We want to send you a copy.

In the past 15 years, we have sold 70 separate issues of Drainage and Irrigation Bonds, without a dollar of loss to any investor. We are the largest dealers in these Reclamation Bonds, and they have become, in late years, our most popular bonds.

Irrigation Bonds are secured by liens on the most fertile farm lands in America. The value of the land is often more than four times the loan.

Some are municipal obligations, forming tax liens on the real property located in populous districts.

They are serial bonds, running from two to twelve years. Each year, as the loan is reduced, the security back of the rest is increased.

The denominations are $100, $500 and $1,000, so one may invest either little or much.

The interest rate is six per cent. No other large class of bonds, equally well secured, now pays an equal rate.

These bonds are bound to become more and more popular as they become better known. They are the utmost in six per cent. bonds. Please send us this coupon to-day for our free book, so you may know the facts.

Forty Years of American Finance
A Short Financial History of the Government and People of the United States since the Civil War, 1865-1907.
By ALEXANDER DANA NOYES
Financial Editor of the N. Y. Eve. Post.
Being the Second and Extended Edition of "Thirty Years of American Finance."
Cr. 8vo. $1.50 net.
The new book carries the story of the American financial markets down to 1908, describing and examining such episodes as the industrial revival after 1898, the great boom of 1901, the history of the Steel Trust, the promoters' mania, the "rich men's panic" of 1903, the "millionaire speculation" of 1905 and 1906, and the panic of 1907. This is the first complete and thorough history that has been published of this extraordinary, dramatic, and interesting chapter in finance.

School Library Necessities

Lippincott's New Gazetteer

EDITED BY ANGELO HEILPRIN AND LOUIS HEILPRIN

A geographical dictionary of the world, giving an accurate picture of every corner of the globe in its minutest details, as it exists in the twentieth century. Statistics of population, production, mining, manufactures, physical history, exploration, general history, etc., have been gathered from the latest official censuses, domestic and foreign. Each one of its 100,000 notices, varying in length from a single line to thousands of words, speaks for itself.

"It is one of the few volumes that can at once claim a place in every library by right of supreme excellence."—*Record Herald, Chicago.*

"Libraries having few reference-books will find in this volume a mine of geographical information, which will practically supply their needs in its field."—*Public Libraries,* Chicago.

Over 2,000 pages. Quarto. Sheep, $10.00 net; half Russia, $12.50 net.

Patent thumb index, 50 cents extra.

Chambers's Cyclopedia of English Literature

NEW REVISED EDITION

A clear and comprehensive survey of English literature from the beginning to the twentieth century.

Contains an authentic biography of every American and English writer of note, whether poet, dramatist, novelist, or historian, including a portrait wherever it has been possible to secure a satisfactory likeness.

This Cyclopedia represents the work of over sixty years by some of the foremost literary men.

It is the cheapest authoritative reference work of similar scope now in print.

It contains the essence of hundreds of the most valuable books in English literature, and is a library in itself.

Illustrated with approved portraits and drawings. Contains over 2,500 pages. A detailed table of contents in each volume. Complete in three imperial octavo volumes, stoutly bound in cloth, with gilt tops, $12.00 net per set.

Lippincott's Dictionary of Biography and Mythology

By JOSEPH THOMAS, M.D., LL.D.

This magnificent work, which for years has been in its department without a rival in the estimation of scholars, has lately undergone an extensive revision, which was rendered necessary by the great strides that have taken place in every field of human activity in the last few years; it is now offered in a greatly improved form, embracing, besides the revision of the articles included in previous issues, numerous new biographical sketches of persons who have lately become of sufficient prominence to merit mention.

Illustrated. Octavo. Sheep, $8.00 net; half morocco, $10.00 net.

Also a Subscription Edition in two volumes.

New Books

The Development of the State $1 50

By JAMES QUAYLE DEALEY, *Ph.D., Professor of Social and Political Economy, Brown University.*

A vigorous exposition of the evolution and organization of the State. Free from conventional, abstract disquisitions on political science, it is practical, optimistic, and vivid with human interest. It is preëminently adapted to the needs of the college student, yet its live, literary quality commends it to the general reader, and its scientific accuracy makes it valuable for library reference.

Sociology (*Ready in September.*)

By JAMES QUAYLE DEALEY, *Ph.D.*

Treats present-day social problems with unusual vigor and common sense. It offers a constructive theory for social betterment based on the application of sociological principles to existing social conditions.

NEW YORK, THURSDAY, SEPTEMBER 9, 1909.

The Week.

We are glad to know that the personal-baggage law is now so rigidly enforced that decent American citizens of both sexes are being treated on our docks as if they were pickpockets, thieves, and smugglers. This is what the law calls for and Collector Loeb is to be thanked, not abused, for so enforcing it. Every American is a suspect in the eyes of his government on his return from abroad, without regard to color, creed, or previous condition of servitude. Privacy no one need ask; respect for modesty or decency is particularly forbidden by the law. Inspectors have the right to open one's pocketbook, feel the contents of a hip pocket, and kick the lining of a woman's skirt. There is no disrobing performance which they cannot order, if they see fit; it is only kindness on their part that they permit ladies to be examined in seclusion. This is America in 1909; some few years after civilization was supposed to have been established in this country. We hope sincerely that Collector Loeb's authorized ruffians will invent still other means of annoying travellers. The latter had their chance during the "revision downward," but the personal-baggage abomination remained unchanged. Nothing will satisfy us, except such rigorous humiliation of every American criminal enough to spend money abroad as to make him swear vengeance on the political party responsible for so great an outrage.

With a postal deficit of $20,000,000 for the last fiscal year, it is not strange that Postmaster-General Hitchcock is canvassing the possibilities of economy in his department. For the previous year, the deficit was $16,000,000, but that was explained as partly the result of the panic of 1907. Postal revenues fell off with all other. But that excuse no longer avails. Indeed, it was pretty flimsy all the time, since the real reason why our postal service comes so far from being self-supporting is perfectly well-known. It is the extension of the rural free-delivery service. Every year Congress votes for the establishment of new routes, scarcely one of which comes near paying for itself, and the total effect of which is a steady drain of millions upon the Treasury. Yet let the Postmaster-General say a word against this, or attempt to check the rural free-delivery expansion, and he will see what will happen to him! It is one of those political luxuries which cannot be cut off even in hard times. The country has set its expenditure on a lavish scale, and finds retrenchment hateful.

A Washington correspondent has discovered another conspiracy by "the money-power." He declares that Treasury officials are carefully inquiring whether "certain moneyed interests" are not in a plot to make the government pay higher interest on future issues of bonds. After having boasted of our ability to float a 2 per cent. bond at par, and duly pointing out that this made American credit "absolutely the best in the world," etc., it is, indeed, something of a come-down to find that our government-guaranteed 4 per cent. Philippine bonds are selling at only 102, while the Secretary of the Treasury has had to be empowered to pay as much as 3 per cent. on loans on certificates or on the new Panama bonds, if any are offered. But this excited correspondent has simply discovered, not a crime, but a fact, and a fact long known to everybody but those who live in a world of imagination. The 2 per cent. rate was purely artificial. It was wholly a matter of forcing, or inducing, banks to take bonds at that figure, as a basis for circulation, or as a security on the strength of which to obtain government deposits. But the Treasury is now withdrawing funds from banks, rather than depositing them. There is a glut of government bonds, and their price inevitably falls. With the indirect premiums that went with the 2 per cent. bonds no longer possible, we are waking up to the actual measure of our public credit. It is not a conspiracy which the Washington correspondent has discovered: merely a mare's nest.

The strike at McKee's Rocks, which only the other day seemed lost to the employees, in spite of the rallying of an active public sentiment to their side, appears now to be more than half won, largely through the operation of the same force of public sympathy. Enough has been made known concerning conditions in the Pressed Steel Car Company's plant to preclude any real defence by the officers of the company against the charge that, leaving aside the nominal wage scale, they have been guilty of gross unfairness towards their men. The company is reputed to have placed its case in the hands of a committee of citizens for mediation. It concedes every demand of the strikers except an increase in wages, which it submits its books to show it cannot grant at the present time. Since the abolition of the pooling system, which the company now concedes, was one of the principal causes of the strike, it should not be difficult for a settlement to be arranged on the basis of a future increase in wages if industrial conditions should warrant it. The case of the strikers has been helped by their success in winning over the men imported to take their places. In all disputes between employers and their men nowadays the right of the outside workman to take employment where he can find it becomes immediately involved. But the strike-breaker's right to work is seriously modified when his labor, as has been shown to be the case at McKee's Rocks, has been obtained by misrepresentation and not infrequently retained by force.

The latest Gompers resolution to be ignored by the International Trades Unions Congress at Paris reads like excellent nonsense. The man who was unable to deliver the labor vote last November proposed that labor organizations the world over should exert themselves to prevent the emigration of workingmen to countries suffering from industrial depression. The resolution squares beautifully with the exodus from this country which set in after the October panic of two years ago. Workingmen are so notoriously attracted by the prevalence of unemployment and the prospect of starvation that only an international movement can keep this country from being swamped by unmi-

Boston Public Library

grants just when our factories are shutting down. What Mr. Gompers meant was that his foreign comrades in the international labor movement should pledge themselves to keep away from the United States until American workingmen had attained a degree of comfort and contentment where they were willing to let the alien have a look-in. Thus Mr. Gompers shares visibly in the beautiful spirit of unselfishness that animates our tariff-hoisters. When we have had all that we think we need and can stand, you may come in and see what you can pick up for yourself. This sentiment, to the protection high-priests, is quite compatible with the fact that America spells equal opportunity. This sentiment, to the labor unions, seems quite compatible with workingman internationalism and the brotherhood of man.

Is the American farmer over-educated for his calling? The new zeal for technical instruction goes too far when it raises a sneering voice against the "little red school-house" which teaches the American country lad how to become President, but not how to cultivate his father's acres as they should be. Only, those people who would reorganize our elementary school system so as to substitute soil-chemistry and dairying for geography and spelling, have still to show that the average farmer lad suffers from over-proficiency in the latter branches. If our schools were wholly engaged in training American Presidents, the change might seem to be called for. But it used to be supposed that the training of American citizens is a legitimate function of our public schools, and those acquainted with the ordinary standard of the rural elementary school will hesitate to believe that they teach more than the responsibilities of American citizenship call for. The average of culture is not so high in our country districts that we can afford voluntarily to reduce it—this aside from the common truth that a general education pays for itself by increased practical efficiency in any occupation. American agriculture, it is quite true, is in need of being placed on a higher scientific basis. But such higher knowledge must radiate from our agricultural colleges, our experiment stations, and our various government enterprises. Transforming the little red school-house into a farmers' institute for boys, would be to make the agriculturist's last condition worse than his first.

It is significant of our national tendency towards what is "practical" and "business," that an editor and publisher of an aeroplane magazine complains that America has been distanced by France and Germany and even England in the commercial use made of the recent flying machine inventions. "France has seen," he says, "that flying in the air will be quickly taken up as a sport. She has gone ahead (as she did with the automobile), to draw the attention of the world to the country as the centre of the sport of flying in the air and as a maker of flying machines." Eight or ten French firms, it is sadly pointed out, have already established factories for turning out these craft. They "are making more than twenty times as many as we are." And, alas, Germany is producing dirigibles with great speed, and even poor old England is trying to get going. The poor man fears that Americans will be compelled to buy their air machines in Europe, just as they did, at first, their automobiles. While the French are hailing the machine with joy as a new and inspiring addition to civilization, we have an American complaining that we may not reap sufficient material advantages therefrom. But, cheer up, it is not really so bad. There are already several factories in America manufacturing aeroplanes, with others in preparation here and in Canada. If French enthusiasm for general civilization has, as one of the results, a commercial advantage, that is something for our more "practical" genius to consider.

The recent aerial tournament at Rheims emphasized something more than the solution of certain problems in acronautics. It brought out sharply the change that has come into the very process of the inventor's art. We are pretty far now from the classic picture of the unappreciated genius toiling for a life-time over his machine until he broke his heart, or, successful, flung his invention into the face of an astonished world. There is very little secrecy now in the business of scientific discovery, because there is so much more co-operation. The modern genius for publicity directs ten thousand hearts and minds all over the world to the working out of a single problem. Coöperation, to some extent, of course, even the earlier inventors knew. Fulton's title is not an undisputed one. Neither is Morse's, nor Bell's. The history of invention and discovery is replete with men who have hit upon the same idea or borrowed from each other and gone their own way. But there is a vast difference between such accidental connection and the systematic way in which the modern army of discovery is organized. Let the basic idea be brought forward, the problem put, and, if there be anything in the idea to seize the popular imagination, the attack begins. Compared with the painful struggles of the early inventors, it is like the march of the Japanese army upon Mukden, compared with an Indian raid. Learned societies and individual students develop the theory of the problem. Rich men finance experiments and offer prizes for this or that partial success. Governments grow benevolent, and in the last extreme, nations go mad with enthusiasm and make the task their own, as Germany has done with Zeppelin.

The sale, for two million dollars and a half, of a portion of the Maurice Kann collection of paintings, which has formed one of the most valuable private galleries in Paris, to the art dealers Duveen Brothers, who have a branch house in New York, probably means that some, perhaps all, of these important works of art will come to America. The collection includes four Rembrandts, three portraits by Franz Hals, two works by Van Ruysdael, one by Cuyp, one by Sir Joshua Reynolds, and eight panels painted for Mme. Pompadour, by Boucher. It is thought that rich Americans are interested in this sale, as in the sale two years ago for five million dollars of the Rodolphe Kann collection; and that, perhaps, the reason why the sale did not take place earlier is connected with the removal of our tariff from old works of art. Now, these beautiful paintings may come to this country without duties. If it is true that they are to come here, it is a piece of rare good fortune, for the day when fine old pictures, especially collections of fine old pictures, can be obtained at any price, is well-nigh past. Italy, that great source of old art treasures, has put an end, by govern-

mental act, to the prodigality with which it formerly allowed its priceless works of art to be distributed, sometimes for a song, all over Europe. And throughout civilization these objects, the educational value of which has never been so widely and keenly realized, have now largely been collected in galleries and museums. Old Europe ought not to envy young America its opportunity to secure one of the most important means by which the best of Europe's culture may be sympathetically understood in the New World.

After a shock like the capture of the British golf championship by a Frenchman, or the defeat of Leander by a Belgian crew, English opinion is likely to recover complacency by the thought that such events are, after all, isolated performances which count very little in the comparison of the general athletic average among the nations. When all is said, the fact stands that the average Englishman is a devotee of sport, while the average Frenchman or German is not. Athletics on the Continent is the fad of the rich. The important thing that is apt to be overlooked by the open-air Englishman in pitting himself against the puny or flabby foreigner, is that the foreigner, in his two or three years of compulsory military training, really passes through a course of physical culture which shows up very favorably against the beneficent effects of English sport.

The Riff coast continues to absorb new levies of Spanish troops. According to a dispatch, Madrid has just ordered the embarkation of a picked division of 11,000 men for Africa. Spain has her hand in the hornet's nest and cannot let go. If her troops meet with reverses, reinforcements are imperative to save the army and the national honor. If her troops make an advance, reinforcements are needed to hold the new positions and guard the increased line of communications. Such is the nature of North African fighting, as France found out a short time ago under conditions more favorable than those that now confront the Spanish government. The Spanish taxpayer will soon feel the heavy cost of colonial adventure. An extraordinary appropriation by the Cortes is being considered and is perhaps inevitable. The Cabinet will have its doubts before it takes the risk of a new popular upheaval by calling for new taxes or a loan in the face of profound popular disapproval of the war. But though the Conservatives may have to make way for a Liberal Cabinet, the country is too deeply engaged in Africa for any party to bring the war to a halt. The Spanish nation will pay the penalty of foolish government in blood and treasure, but the government, in turn, will pay the penalty in an intensified public discontent and a sharp increase in the Republican and anti-clerical propaganda which will bode the monarchy no good.

A crisis has developed in Franco-German relations, and this country is in imminent danger of becoming an interested party. A Berlin professor asserts that grave mistakes have been made in the mounting of the Diplodocus Carnegii recently installed in the Museum of Natural History in Paris. German scholars love to shoot holes in the professional reputations of their colleagues across the Rhine. It was a German professor who brought out the truth about the tiara of Saitaphernes a few years ago. Now comes the charge that the Paris Diplodocus, in having his legs adjusted almost perpendicularly to his vertebral column, like those of an elephant, has been placed in a class intermediate between the mammals and the reptiles, whereas it is among the reptiles he belongs. Did Diplodocus use his legs to stand on? French experts reply with warmth that the attitude in which Diplodocus has been mounted was not necessarily his habitual one. "Does not the distinguished professor at Berlin sometimes fall into odd and unaccustomed attitudes?" Thus the war goes on. Inasmuch as Diplodocus was donated to the French by an American philanthropist, and mounted by an American palæontologist, it is hard to see how we can avoid taking sides with France.

At Seattle, last week, marked honors were paid to a delegation of Japanese business men, members of Parliament, educators, and journalists, whose mission is to promote friendly relations between this country and Japan. The confirmed believer in Dreadnoughts is inclined to sneer at such methods of fostering international peace. What are the visits of a handful of doddering college professors and clergymen as against the tempests of national sentiment that blow up whenever *he* gets busy? He will point out that a public demonstration such as yesterday's at Seattle may be preceded and followed by a sharp display of nasty racial temper. That, in a way, is a form of inconsistency with which the Pacific Coast has made us familiar. Yet the fact remains that missions of friendship and mutual instruction keep coming and going across the Pacific while jingo outbreaks pass away like a bad dream. When the temporary fury has cleared, the Pacific Coast perceives how utterly incompatible with its vast dreams of Asiatic development is the maintenance of a cat-and-dog policy towards Japan. Seattle, now in the midst of her exposition and of great expectations, recognizes this fact, and so does California whenever the demagogue and the wild-eyed journalist will let her alone.

A final adjustment between China and Japan with regard to Manchuria comes after protracted negotiation. The thing that stands out most clearly in the ten clauses of give and take is that none of the matters under dispute was of such a complicated nature that it could not have been disposed of in a few months, if the parties concerned so willed. For instance, four years after the treaty of Portsmouth ceded the Fushun mines to Japan, China consents that Japan shall work those mines—and if we are not mistaken, Japan has been working them—upon payment of just compensation to the owners. Such a conclusion might have been easily predicted. Equally obvious are the compromises dealing with railway construction in Manchuria, and Chinese authority in the disputed Chien-tao district. Evidently, neither party was in haste to conclude negotiations; China, by force of habit, we presume, and in the belief that delay always works in her behalf; Japan, because it is to the interest of an ambitious power in Manchuria always to have an unsettled quarrel or two under way with China. It holds open the door, and supplies the excuse, for an incursion into any little game of general international politics that may be going on at Peking. Even now for instance, Japan refuses to discuss the question of administration within her railway zones.

DISCOVERY OF THE NORTH POLE.

In an age of miracles, there have come within a week, with fairly stunning coincidence and unexpectedness, reports of the discovery of the North Pole, from Dr. Frederick A. Cook and Commander Peary. They have furnished an unparalleled scientific sensation which may continue for years to come. Few people were aware that Dr. Cook was in the Polar region, still fewer that he contemplated a dash toward the Pole. He now states that he reached the furthest North nearly three months before Peary set sail in 1908, or on April 21 of that year, while Peary arrived there on April 6, 1909. Thus, at last, the will-o'-the-wisp has been caught, which for centuries has lured men to destruction. An age which has beheld the successful employment of aeroplane, dirigible balloon, submarine, wireless telegraphy, and all the other marvels of the present epoch, now witnesses the final conquest of a fraction of the world which has challenged the imagination of men ever since it was finally established that this planet is round.

Dr. Cook tells us in his cablegram to the New York *Herald* that, with the aid of an Eskimo tribe of 250 people, he largely improvised his polar expedition, when only 700 miles from the North Pole. Pemmican and other supplies were furnished by the generosity of John R. Bradley from the yacht bearing his name. Dr. Cook set out, it appears, with eleven men, from Smith's Sound at sunrise of 1908; and crossing it marched over Ellesmere Land to Nansen Sound, following the latter until he reached the Polar Ocean at Land's Look, discovered in 1902. He was then well to the westward of Peary's usual tracks, and in good position to take advantage of the eastward drift of the ice. This portion of his journey consumed just a month, and thirty-four days later, after extraordinary hardships, with only two of the eleven companions with whom he set out, he arrived at the point of his desire, at the extraordinary average speed of nearly fifteen miles a day. The Duke of Abruzzi's wonderfully equipped party made, in 1900, 600 miles in ninety-five days. During the first stage, they covered only about five miles a day; on the return they accomplished ten. After two days' rest at the North Pole, Cook was able to turn back, he says, with enough food on his sledges to reach Nansen Sound, if he could average fifteen miles daily. He failed to do this, but, finding an underground cave on Cape Sparbo, he was able, with bow and arrow, lance, and knife, to kill musk-oxen, bears, and wolves enough, after his ammunition gave out, to survive the long winter of 1908-1909. He returned to his base this summer. No other explorer, we believe, has had similar good fortune in subsisting himself in the Arctic for so long a time. While his achievement, as thus far related, is not impossible, the scientific world maintains a proper attitude of skepticism until, by his observations, he shall be able to furnish satisfactory proof. Of this, Dr. Cook cannot complain; there is behind him no such record of service to science as supports Peary. But Peary should be able to help him make good his claim, if it is true.

The value of an established character was never more clearly shown than by the reception given to Commander Peary's cablegram announcing his having reached the Pole. A man of the highest professional standing in the navy, a dauntless searcher after knowledge of the unknown now no longer unknown, he has never failed to demonstrate to the satisfaction of the learned world that he went about his great task with scientific accuracy and truthfulness. No one has ever questioned a single statement of his in twenty-three years of persistent Arctic exploration. To him has been accorded every honor due one who is pioneer along arduous paths untried by man. He will everywhere be acclaimed without a suspicion of jealousy. Foreigners as well as Americans will, we are sure, rejoice unreservedly that such long and trying years of unrequited labor have at last been crowned with success. And we shall hear not at all of that "jealousy of savants" of which there has been so much idle talk in Cook's case.

This universal applause of Peary will not be dimmed even if it should appear that another reached the North Pole before him. The lustre of his achievement is not thereby tarnished. The man who went ahead could leave no trails behind to guide his successors any more than could Peary. The veteran had to overcome obstacles precisely as if he were the first to venture into the trackless wastes, and he conquered them because of years of careful study of Polar conditions, of patient effort, of iron-muscled endurance. Now that success has crowned his efforts, he will find as cordial a welcome from his countrymen as anybody could possibly expect. It will, we believe, be intensified by regret that the cablegrams announcing his discovery could not have reached the outer world a week earlier.

Henceforth, the Arctic explorer will give way to the scientist, who will be less desirous of making a record or a discovery than of adding to the world's scanty store of knowledge of things Polar. For while the scientist's spirit has always actuated Peary, of latter years everything has had to give way to the one great and honorable object of his life—the dash for the furthest North. We should now see more expeditions like Shackleton's, with its array of trained observers, experts in biology, geology, zoölogy, and meteorology, making their investigations in permanent stations, regularly relieved and covering an ever-increasing territory, until the whole of the Arctic shall have been mapped. Several governments united in such an undertaking at the time of the Greely and Ray expeditions from this country, and they might well do so again. But the future of Polar exploration will take care of itself; for the moment it is the present that concerns the world. That the honors belong to the United States is a cause for unfeigned national rejoicing. From the days of Kane onward, it has seemed, somehow, as if Yankee pluck and energy were entitled to this distinction. A nation of pioneers, home-makers for two centuries in the wilds of a continent, Americans were fitted by training and experience to continue these conquests of civilization. And Peary has typified in himself the best American tradition; simple, modest, unassuming, a gentleman and a scholar, he will wear his laurels with becoming grace, and will without hesitation share them freely and ungrudgingly as soon as Dr. Cook can produce his proofs.

CANADA AND OUR TARIFF.

Current dispatches from Montreal show that the Canadian press and Government are anxiously considering the effect of the new American tariff upon trade relations with the Dominion. The

question of what policy the Canadian authorities ought to pursue need not be decided immediately, since the retaliatory provisions of the Payne-Aldrich bill, if they are to be enforced against Canada at all, cannot come into play before March, 1910. Even so, the time is short. Canadians admit, too, that the issue has taken them somewhat by surprise. They did not follow our tariff debates with very great interest or close attention. The strong feeling of national self-sufficiency which the past decade has brought to the Dominion, along with the expansion of commerce and manufacture, had made our northern neighbors rather indifferent about American fiscal legislation. Canada, like Cavour's Italy, was to do it all by herself. The old desire for a reciprocity treaty with the United States had largely passed away. The Americans could do as they pleased. But now the question is suddenly thrust upon the Canadians whether they are to have with us, not trade arrangements, but a tariff war.

The *casus belli*, if there be one, has to do, of course, chiefly with the duties on paper, wood-pulp, and lumber. Subsidiary is the matter of Canada's preferential treatment of British imports, and her pending commercial treaty with France. These questions apart, Canada can find little to complain of in our new tariff. Indeed, on several of her leading exports to the United States, the Payne-Aldrich bill lowers the customs rates, so that Canadian exporters are, to that extent, favored. The cutting of the duty on coal from 67 to 45 cents a ton should tend to increase Canadian shipments to New England. Last year, the value of Canadian coal exported to this country was about $4,000,000. So, too, the placing of hides on the free list may stimulate their export from Canada, the value of that product sent to us in 1908 being some $1,300,000. It is thought, also, that the reduction of the tax on iron ore to 15 cents a ton may have the effect of developing iron-mining properties in Canada.

These mercies, however, cannot but seem minor to the Canadians, in view of the possibility that their wood-pulp and paper-manufacturing industries may be hard hit by the retaliatory clauses of the new American tariff, and that a sharp difference over these items may lead to the application to Canadian goods of the maximum duties all along the line. The difficulty will arise under Section 2 of our tariff, which defines the maximum and minimum tariff. The President is empowered to ascertain whether any foreign country lays a "prohibition upon the exportation of any article to the United States"; and this extends not simply to any government, dependency, or colony, but to any "political division thereof having authority to . . . impose restrictions or regulations upon the exportation of articles which are, or may be, imported into the United States." This strikes directly at the provinces of Ontario and Quebec, which prohibit the exportation of wood-pulp. In addition to the higher, or retaliatory, duties specifically laid down in the paper and wood-pulp clause of our new tariff, this prohibition, if unrepealed, might draw upon the offending provinces the levying of the maximum tariff upon all their exports to the United States. On the other hand, Nova Scotia and New Brunswick, which do not forbid the exportation of wood-pulp, might be in a position to enter into highly favorable trade relations with this country. One sees how intricate is the problem thus forced upon both the provincial and the Federal authorities of the Dominion. As the Toronto correspondent of the London *Times* puts it, Canada is rudely awakened to "the craft, skill, and foresight," with which the American tariff has been drafted against her wood-pulp and paper industries.

The latest advices agree that the various provincial premiers are in active consultation with the authorities at Ottawa. A great difficulty in the way of any adjustment is the feeling of many Canadians that they have American paper-manufacturers at their mercy. By cutting off Canadian supplies of wood-pulp, it is only a question of time, they argue, when the transfer of the paper-making industry to Canada will be inevitable, in view of the rapidly vanishing spruce-forests this side of the border. Yet there is a sharp division of opinion between the two interests concerned. The wood-pulp men desire the continuance of the policy of prohibiting exports, to bring Americans the sooner to their knees. Canadian paper-manufacturers, on the other hand, would like a chance at the American market, under the lower paper duties of the Payne-Aldrich bill. They know that they will be the first to be hurt, if a tariff war breaks out and their product is heavily penalized in our custom-houses. Altogether, the resulting situation confronting the Dominion authorities is exceedingly difficult.

Canadians have been counting upon the reasonable and friendly attitude of President Taft. They have quoted with satisfaction the words which he uttered at the Champlain celebration, wherein he dwelt upon the fact that an increase of trade between the two countries would be profitable to both. And it is to be noted that the new tariff leaves the whole matter to the discretion of the President. It is he who has to be "satisfied" that undue discrimination against us exists; and in applying maximum duties he "may" extend them to the whole country, or "may" exclude any "political division" thereof. Thus it will be seen that on our side, too, the task is one of extreme delicacy. If both governments approach it with open minds and in a friendly spirit, we are confident that a fair and honorable agreement can be reached.

AWAKENING OF THE BREWERS.

The action of the New York State Liquor and Beer Dealers' Association last week is in one way a pointed, if a back-handed, compliment to the recent prohibition agitation. If the laws that have been put on the statute book against the sale of liquor are wholly inoperative, there is little reason for collective defensive action by those interested in the liquor business. But while such prohibitory laws undoubtedly are but laxly enforced outside of rural communities, where the law is backed by strong public sentiment, the recent expansion of "dry" territory has sensibly pinched the brewers. When the traffic is under the ban, consumption seeks the most highly concentrated form of spirits. The bulk of malt liquor makes it difficult to conceal. The brewer, therefore, is more vitally interested in arresting the new movement than is the distiller. For several years the trade has begun to realize that a change of tactics was necessary. The old extreme assertion of personal liberty, the denunciation of sumptuary legislation, and the allegation that the temperance crusade was merely an attack on private

property have been abandoned. As a prominent dealer said in the recent convention of the United States Brewers' Association at Atlantic City: "Gentlemen, there is only one way for a man to put his house in order. It is to do it himself. The common house in which we all live is in need of such putting in order, and no one individual among us occupants of the house can accomplish the task single-handed."

The opponents of the liquor traffic have fairly forced home upon the trade the acknowledgment of its responsibility for the "dive," the disreputable illegal den where liquor furnishes the fit nucleus for vice of all sorts. The chairman of the brewers' literary bureau told them last week that "the continuance of the 'dive' rested largely with the brewers themselves." In various States, the brewers have taken measures to cut off this excrescence, hoping by its elimination to stem the torrent of adverse public sentiment. In Texas and Ohio, and in various cities, especially Milwaukee, the fight against the "dive" is undertaken by the wholesale trade. Thus in Ohio, they have organized a Vigilance Bureau, and have employed a detective staff to secure evidence for effecting the forfeiture of licenses by retailers who do not obey the law. Either the toleration of gambling on the premises or the admission of women of doubtful reputation to the saloon is ground for the withdrawal of the license. The fact that evils of this kind gravitate to the spot where liquor is sold, however, will make such an effort at reform extremely precarious.

Moreover, it must not be forgotten that, from a business point of view, the trade is interested in the maximum sale and consumption of liquor. The opposition to the "dive" is primarily commercial and not moral. Indeed, a recent writer attributes much of the current animosity shown towards these places to the fact that, relatively, the "dive" is a poor customer. The dealers are willing to throw overboard a child or two to satisfy the wolves of public opinion, hoping to make their escape with the greater part of the family uninjured. How thoroughly competition rules in the business, moreover, is illustrated by the incident narrated at the meeting of the Liquor Association. When two years ago New York brewers decided that certain notorious resorts at Niagara Falls should no longer be supplied with liquor, the enterprising Chicago brewers came promptly to the rescue of the beleaguered sellers.

The movement to reform the trade "from within" involves difficulties similar to those which attach to the same process when applied to a corrupt political organization. Half-way morality or half-way legality is, of necessity, a condition of unstable equilibrium. In the resolutions adopted last week, the trade calls for the passage of a law permitting Sunday selling from one o'clock in the afternoon until eleven at night. Whatever be thought of the advisability of such a law for a city population largely of foreign antecedents, it is certain that the rural legislator is strongly against such a proposal. In the absence of such legal permission, the interests of the brewers directly clash with the law. How, under the circumstances, will they be able to pose as the champions of law and order against the abandoned dive-keeper, while they must consciously aid and abet the violation of the Sunday-closing law?

The resolution which the association adopted favoring the limitation of saloons to one for every 750 inhabitants looks to a more promising reform. At present, there is estimated to be one saloon for every three hundred persons living in our cities. The reform of the city liquor traffic must evidently for some time move along the line of decreasing the number of saloons. The gain to be derived from this innovation is not primarily to be found in the reduced per capita consumption. It is rather to be expected in a change in the character and responsibility of the retail dealer. Should the value of the license be artificially enhanced by a strict delimitation of the number of drinking places, its loss would become very serious financially.

It is estimated that something like $550,000,000 represents the capital invested in the American brewing industry. The direct ownership of saloon property by brewers is put as high as $25,000,000, and their advances and loans to retailers at $70,000,000 more. In other words, saloon property to the value of almost $100,000,000 is practically in the hands of a relatively small number of brewers. The responsible agent in the liquor-selling business is not the man behind the bar, but the man behind the brewery. He is going to sell the last drop that will yield a profit, so long as his business is not endangered. The direct responsibility of the brewer for the character of the liquor traffic is now well recognized. Reform evidently lies in making the brewer find that it is profitable to keep the law. If he can see it for himself, so much the better. But he can no longer deny the responsibility, and the community will increasingly put the onus of law observance on the man "higher up."

PRESIDENT LOWELL'S OPPORTUNITY.

Rather naïve press dispatches have appeared in the last day or two, informing the public that, in his coming inaugural address, President Lowell will have some reforms to announce. On this basis, one of our contemporaries has been moved to remark that Mr. Lowell would seem to have policies of his own in contradistinction to those of his predecessor. We violate no confidence in recording prevalent Cambridge belief that it was precisely because Mr. Lowell was known to have ideas of his own as to the future of Harvard University that the majority of the Fellows elected him to the position he now fills. Moreover, Mr. Lowell has on two or three occasions since his election so clearly indicated several reforms which he has in mind as to make it certain, months ago, that his inaugural will be an exceptionally interesting document, and that the college world will find the developments at Harvard during the next few years of absorbing interest.

What, for instance, is to be Mr. Lowell's attitude toward the elective system, to which Harvard owes so much of its prestige and so much of its extraordinary growth under President Eliot's guidance? It is already known that Mr. Lowell thinks that the honor degree should mean more than it does. He has placed himself on record as being of the opinion that men should come to college to work and not to play, and—strange man—he is even emphatic in his belief that scholarship should be at least as highly rated as athletic prowess. Mr. Lowell's mind is of the type that leans toward practical suggestions. That there is dissatisfaction among

hundreds of Harvard graduates with the education they received, he must fully understand. What modification of the elective system he will advise is, therefore, the question of pressing interest, and not whether he will make any recommendation. The story is told that President Dwight of Yale once assured President Eliot that the ideal curriculum was one making the freshman and sophomore studies compulsory, but the others wholly elective. Mr. Eliot was able to show his distinguished colleague that Harvard had held the same view some ten years previously only to abandon it. There are those who think that the Bryn Mawr group system of studies is the ideal one, and others who prefer still another arrangement.

What Mr. Lowell favors, he will make known in due course. Whether or not he is able to find some workable plan for better guidance of the Harvard undergraduate, and closer supervision of his work, no one can question that some such reform is necessary. In an educational pasture of surpassing richness, too often the Harvard student knows not where to nibble, and overlooks the most nutritive morsels. Such rare personalities and illuminating scholars as the lamented Professor Shaler or the late Prof. G. M. Lane have often been passed by because there was no one at hand to tell of the fruits to be gathered. Hence, also, too many students have browsed here and tasted there only to find when the four years were gone that they knew nothing well; that beneath the acquired polish and smattering there was no solid foundation of learning. Mr. Lowell's great opportunity is, therefore, to devise some plan by which freedom of choice shall become freedom of *intelligent* choice in consonance with a man's future career.

No part of his inaugural will be more eagerly awaited by teachers than that which deals with this elective question. There is, however, another undergraduate problem of even greater difficulty, with which, as Mr. Lowell announced at Commencement, to the satisfaction of every thoughtful alumnus, he proposes to deal—whether Harvard is to be a genuine democracy true to its ideals and the interests of the Republic or not. Every one knows that Harvard has suffered because it has been called the rich man's college; every Harvard man worthy of the name has deplored the appearance near the "Yard" of those palatial private dormitories called "Millionaires' Row," we believe, by the irreverent. The struggles of the Western alumni to obtain still further representation on the Board of Overseers have often been a protest against the domination of Harvard by narrow Boston influences. The apparent aristocracy of wealth and social position in the leading undergraduate clubs and the exclusiveness and luxury of the private dormitories have led more than one graduate to ask whether he should expose his son to such influences. Too often private protests at Cambridge have been met only by a shrugging of the shoulders and a question as to how the university could possibly control private capital.

When, therefore, President Lowell let it become public that he proposed to grapple with this problem at the very outset of his administration, he won immediately the confidence of the alumni. His idea, so far as it has been outlined, is to build a series of freshman dormitories, separate little entities, in which the first year men shall live, not in cliques, according to their means, or the schools from which they hail, or their peculiar athletic tastes, but as freshmen in Harvard College. It would be, of course, unjust to President Lowell to pass final judgment on a plan he has had neither time nor opportunity fully to outline; so far as it has been indicated, it has met with overwhelming approval. More important even than high scholarship, or than leisure for professors to do creative literary work, or many another issue which will sooner or later attract and hold the new president's attention, is this fundamental one, that the Harvard undergraduate shall stand on his own feet, and that he shall rank not according to what wealth his father possesses, but by what there is in him and what he can bring to the university life. The problem is not confined to Harvard alone; nor is it anything else than a reflection of changing social conditions, particularly in our cities. No other is more difficult; yet by solving it, even if only partially, Harvard's new president will win the gratitude, not only of his alumni, but of the whole country.

IN CATALOGUE-LAND.

Early September is a season of heavy reading in catalogue literature. In the consumption of descriptive price-lists, illustrated and plain, the beginning of autumn ranks only after the beginning of spring. September is a starting-point both for retrospect and for anticipation. The amateur gardener turns once more to his well-thumbed nurseryman's catalogue, to compare what he hoped and set out to do with what the summer has actually brought him. The fisherman and hunter is getting ready for his vacation. What elaborate research in sporting-goods catalogues and railroad time-tables that calls for, need not be dwelt upon. Modern hunting is like modern warfare, wherein victory on the battlefield has really been won months before in the studious quiet of a War Office. Nova Scotia's hunted moose would be both flattered and convinced of the futility of resistance, if he only knew how many varieties of hunting-boot, of sleeping-bag, of tent-peg, of folding cot, of alcohol-stove, of flour-mixer, and of frying-pan, dealers have devised for his destruction. There are authorities who maintain that the hunter's entire attention should be properly given to the literary preliminaries of his excursion. For whether he slay successfully or not is a matter of chance, but there is no reason why, if he fails, he should not fail according to the rules of the game. Not every one of us can boast the spoils of Nimrod, but every one can see to it that his shooting-jacket shall be the very best thing on the market.

Vacations in themselves are commonplace. Their best sensations come at the beginning and at the end. Country roads are country roads everywhere, a little more or less dusty, a little more or less hilly, giving more or less of a pleasing outlook on hill and water. The most beautiful mountain path is never so beautiful as when we plan to walk it or recall how we walked it. At the beginning of a vacation we derive from the study of distances and altitudes an amount of pleasure altogether disproportionate to the real difference between 1,250 feet elevation and 1,350 feet, or between four miles from the station and six. As a matter of fact, one accidental unpleasant neighbor at the table may take away a sheer 1,000

feet's worth of delight as we measured it in the catalogue, and an odd character or two may turn a little mountain farm-house into a most pleasurable habitation. But once in the city again, and away from the facts we have accepted with composure, we fall victims afresh to the spirit of the catalogue. Tracing out on a map the course of a day's tramp over the hills is to many of us more fun than the walk itself; so much are we the victims of signs and symbols, so accustomed have we grown to think of the printed word as the truth and of facts as only its approximation.

Book-prices or hook-prices, art-dealer's catalogue or the catalogue of the mail-order man, time-tables pored over by the armful and berth-prices weighed and trimmed—the pleasure of it all lies fundamentally in the shopping instinct of the human race. Only the light-minded will scoff at woman's predilection for the bargain counter. It is indulgence in a pleasurable exercise whose appeal we all really experience, however we deny it. There have been men who have put in weeks in choosing between Model 356 and Model 356B for hunting-boots, the difference between Model 356 and Model 356B consisting in one-sixteenth of an inch in the extension of the sole and in the width of the laces. More care than this a débutante could not give to the dancing-slippers for her first ball. In both cases any amount of attention would have been justifiable, but there is no ground for the historical sneer about women and the department store. The collector who searches catalogues for an eighteenth-century edition and the woman who goes to dry goods sales are alike indulging in the pleasurable occupation of reconciling what one would have with what one can have. To the extent of his ten-dollar bill, our collector is the master of the entire catalogue of treasures; to the extent of her ten-dollar bill, the woman shopper is at liberty to visualize herself the possessor of all that swims within her ken. This may seem self-hypnotism, but it is also a training for the imagination. With a complete catalogue before him, the gardener steeps himself in hyacinths and roses, the hunter towers mighty above the holocausts of the slain, and the book-worm rubs his cheek fondly against Caxtons and Elzevirs.

The tradesman's catalogue is a little world of perfect things, like Plato's world of ideal patterns. That is why we love to dwell in it. Bulbs never fail to thrive in catalogues, rifles never miss fire, sleeping-bags always keep dry, old volumes are always in good condition, old masters have never been retouched, old farm-houses are never insalubrious, hill and stream never fade in charm, and mountain-climbing brings exhilaration without effort, in catalogue-land.

A GREAT ACADEMIC PERSONALITY.

I.

Professor Shaler's autobiography* brings the story of his life almost precisely to the date of his marriage, and the rest is told by his wife; the volume being thus divided into two almost precisely equal parts. Such a division of labor in biography, in the case of a man well married, is ideal in at least one respect: each of the two parts of his life is treated by the person who knows it best. Not many wives, however, have made good biographers of their husbands—for reasons too obvious to recount; and Professor Shaler has so good a gift of narrative that the reader of the first half of this volume sincerely regrets that he did not live to write it all himself, as nearly as might be to the end. Nevertheless, if one goes on and reads the second half, the Memoir, one is moved to begin whatever one may say of the whole with a word of hearty admiration for the way in which Mrs. Shaler has met the demands, and resisted the temptations, of her task. Herself no stranger to the pen, she has had the good sense and the good taste to keep her account of her husband free from that too personal tone which renders unconvincing so many similar tributes of wives to husbands. Affection has not marred, but rather guided and controlled, this appreciation of one intelligence by another.

But this praise of the Memoir does not mean that it presents merely Shaler the naturalist, the teacher, the essayist and philosopher, the poet. Were that the case, it would deserve anything but praise. For, however effective Shaler may have been in any one of his many capacities, to those who knew him in the flesh his distinctly personal effect remains ten times as great. So strong, indeed, was his personality, and so remarkable in the *milieu* in which most of us knew him, that we do not merely find the memory and still vivid sense of it inseparable from his achievements; we would all, I think, agree that it was of itself his greatest achievement. It may well be that we are all unconsciously swayed in judging his contributions to the countless themes he wrote about, in assessing the value of his life to those who never saw his face or heard his voice; for we do see him and hear him in all he wrote. Quite probably, therefore, his wider fame and reputation is less and less distinctive than we have fancied it to be. It is not that, however, with which we are charged. The claims of the scientist must be referred to men of science, the poet's to readers and critics of poetry, the essayist's, publicist's, philosopher's, to such as are most interested in the various phases of life to which he successively addressed himself. That he could be all these things, could traverse and inhabit so many provinces of thought, fare forth so intrepidly on so many quests, was in itself entirely characteristic, and the most striking evidence of his extraordinary vitality. But we who knew him do not feel that our knowledge of him is circumscribed by the bounds within which we can companion him intellectually. The range of a personality may indicate, but does not measure, its force, and may not even indicate its quality. A peasant may know an intellectual giant and protagonist better than his peers. If a group of specialists in the fields Shaler invaded were to come together in a symposium of monographs on his life-work, they would probably leave the reader but slightly acquainted with the man. One who knew the man, on the other hand, though a specialist in none of his fields of inquiry, and to some of them an utter stranger, may yet write of him with a measure of assurance.

How many of us *did* know him, and how well! To make himself known, freely, democratically, to all manner of men—this was as great a part of his gift for human intercourse as his related ability to get quickly at the true quality of others. There are personalities potent through reserve, which attract by what is hidden no less than by what is revealed; but not of such was Shaler. Extraordinarily outspoken, and utterly free from snobbery, he made it his habit to go more than halfway—if necessary, to go the whole way—to thorough acquaintance with whomsoever he felt it right that he should know. That he could take the risks of such an intrepidity in friendliness and meet so few rebuffs was not merely or mainly because of the much he had to give, but rather because of the entire sincerity and genuineness of his concern about the other mortal. That concern was sympathetic, helpful, but never of the sort to give alarm to pride; for there was in it always, however benevolently directed, a kind of respectful, almost reverent, curiosity concerning the other nature that had an effect of compliment, particularly with the young. He was as free from

**Autobiography of Nathaniel S. Shaler.* With a Supplementary Memoir by his Wife. Boston: Houghton Mifflin Co. $4 net.

cant and patronizing as from snobbery; in his wide scrutiny and testing of his kind, no one, not even the youngest, felt himself pigeon-holed or dealt with as but a member of a class. I have known no other human being who carried quite so convincing a sense and assumption of fellowship, of brotherhood, into all manner of human dealings.

II.

But does this at all tell the story? Not, I fear, unless the *milieu* of this heartiness is understood; and it can hardly be understood unless it has been known. One does not encounter the phrase "Harvard indifference" very often nowadays, but it had much currency two or three decades ago; and whatever one finds at Cambridge now, one had no difficulty, two or three decades ago, in detecting the thing itself. The great Cambridge University stood then, much more distinctively than now, for an acceptance of universal standards, a throwing over of provincialisms, which seemed to find its fullest expression in an extraordinarily unenthusiastic attitude of individuals towards one another. It is doubtful if any community ever threw the burden of proof so completely, not on the newcomer merely, but on each and every one of its members who showed signs of harboring a lively interest in his neighbors. If one had unhappily acquired elsewhere a Western or Southern habit of miscellaneous likings and intimacies, and were so unfortunate as to crave them, this attitude proved particularly depressing. This, I say, was true two or three decades ago; but what was true then seems to have been only a little less true before that and may be only a little less true now. The pose of the moment heightened something already existent, and which did not pertain to Cambridge alone—a New England way or habit in human intercourse that is often disastrously effective in concealing and bringing to nought what warmth and friendliness there may be—and there is often much—behind it. They were lucky indeed, who, two or three decades ago, found their way through it to the finely shaded courtesy and appreciation of a Norton or to the fairly boyish naturalness and sweetness of a Child. Far greater was the number who got their first sense of welcome and recognition from Shaler; whom he first made to feel—as more than one has expressed it—as if there might not be anything unpardonable the matter with them after all.

Not, however, that Shaler himself ever felt quite at home in that atmosphere or ever breathed it quite freely. This he confesses more than once in the autobiography:

> At the outset New England was very foreign to me, and this though I could not discern in what the difference consisted. It was nowhere in the essentials, for at the firesides and the tables of those who were so good as to make me welcome I found always my own people, so like that I puzzled my wits to see what was the matter, and I hardly know to this day more of it than I did then; yet there is the intangible something which does not—did not then ,and even now does not—fit me, as does the social envelope I have found in England. I am inclined to think it is a secondary effect of Puritanism, which offsets the method of contact of man with man. Some slight, but yet important, peculiarity in the way people look at or greet you or pass you on the street with no sense of your existence—matters of no weight save for the fact that primitive-minded folk are as blindly sensitive as are dogs and other animals to the manners of folk about them.

But this, written after nearly half a century of life in New England and in the university, hardly reflects the chill of a first encounter with that unconcern—compact of the Puritanic, the academic, and the momentarily regnant cosmopolitan austerities—which one underwent a quarter of a century ago; the chill and gloom—no lighter word will serve—through which there nevertheless so often found his way to one's rescue this so unacademic professor with a craving for the frankly human so much stronger and braver than one's own. In that perpetual mission of recognitions, all that was salient, striking, amusing, picturesque, in Shaler's own personality, counted for quick understandings. Of the portraits in this volume, that on page 372 gives incomparably the best idea of his effect to the eye. This is the man one met in those days, slouch-hatted, bearded, cane in pocket, with something of Don Quixote's gravity in his mien, crossing the college yard with long, swift strides, but never too swiftly to stop short, if he knew your face, or thought he knew it, with suddenly outstretched hand and deep-voiced greeting, and a "Come and walk with me a bit!" and then a plunge forthwith into things that deeply concerned one's self or himself or the universe. Where one met him did not greatly matter, for one met him fully and squarely, and all of him, if one met him at all. But he was best met alone. A company, though it did not daunt or diminish him, did claim him collectively. Good as it was to be admitted to his home, one nearly always had to share him there with others, among whom his hospitality would not discriminate. A richer and, of course, rarer privilege was that the Memoir mentions: to go at night to the Agassiz Museum, and, if a light shone through the window of his office, toss a pebble against it, hear the bolts creak, and thus win an entrance, which was never permitted to seem an intrusion, to him and his long reed-stemmed pipe and an hour or two of the best man-to-man talk the Cambridge of that day afforded; at once the most intimate and the widest in range, the most freely personal, if need was, and yet the most highly charged with a frank and quick and sincere concern in all that pertains to the intellectual life. For this last quality, only Charles Eliot Norton could be compared with Shaler; if Norton's manner had the greater charm, and his taste and judgment concerning art and letters a finer sureness, his range was less, and he had far greater reserves.

III.

That Shaler gave of himself so freely, so prodigally—this undoubtedly put him sometimes at a certain disadvantage with stingier souls. It is not a pleasant commentary on human nature, but a true one, that mere withholding, or even the unresponsiveness that comes of having no response to make to one's fellows or to life, may in a certain way—a way too seldom scorned—profit a man more than the most generous casting of his bread upon the waters. Shaler did scorn such niggardliness and its rewards. There was in him something of kinship with Cyrano de Bergerac, content to answer the friend who remonstrated when he threw his purse to a beggar, "But what a gesture!" Nor was that all the Gascon there was in Shaler's nature; he undoubtedly shared with all great talkers a very human appetite for the effects of striking discourse, and as he grew older inclined more and more to emphasis and climax and the round statement that makes for marvelling. He had a kinship also with D'Artagnan and Benvenuto Cellini. If, like these, he held the listeners who marvelled, it was, of course, because his discourse, like theirs, had behind it always a big substance of achievement, experience, attainment. If, to those who knew him, it is impossible to detach these from his personality, it is equally true that without these his personality could not have been at all what it was. His uniqueness lay precisely in the union of candid humanness with far-ranging knowledge and speculation, high idealism, and the confident air of purpose that comes only from large handling of affairs.

His range was actually far wider than his books, various as they are in topic and manner, would indicate. There was one field into which even the Memoir fails to follow him far enough to give any idea of the extent of his activity. We read on page 397 that "the different State boards (the Highway, the Metropolitan Park, and the Gypsy Moth Commission) upon which he served, and the mining organizations with which he was connected, filled up most of the hours left over from his college duties," and that sentence, with the rather full account of his services as State Geologist of Kentucky, is all we have of him as a public servant. As a matter of

fact, the hours he managed to give to the three Massachusetts Commissions were far from few, and his work on them anything but perfunctory. Of the first, he was undoubtedly the ruling spirit, and he should have a great part of the credit for forcing the subject of good roads upon the attention not of Massachusetts only, but of the other States and of the nation. Besides his ceaseless energy, he had an uncommon skill in dealing with politicians—the last gift in the world one would expect to find in a professor. He was as successful with Republicans in Massachusetts as with Democrats in his native Kentucky.

Nor did he at all confine his interest in public affairs to these scientific and semi-scientific concerns of the State. He took his citizenly and even his party obligations with the utmost seriousness. He kept in touch with his party organization, attended caucuses and conventions, served as president of a Democratic club, and won a really potent popularity among his Democratic fellow-citizens of Cambridge. He himself said once that getting on with Irishmen proves a man's human quality as nothing else does; and the Irish of Cambridge liked him as they liked no other of his class. The day he was buried, there was an extraordinary departure from the old attitude of town to gown; the shopkeepers of Harvard Square and the neigaborhood closed their shops.

In "From Old Fields" he has told in verse some of his war-time memories, but it is a great pity that he did not tell them all in the vivid prose of tbe autobiography, which closes as he is going home to Kentucky to enlist. His military service, though in fact brief, was stirring, and it gave a sort of capping to his uniquely unacademic equipment of experience. All his life, however, he continued to have such dealings with unacademic men and affairs that he escaped altogether that effect of the academic life which usually puts those who live it at a disadvantage when they engage with men of business or of the professions over matters remote from scholarship. In such encounters he had not a trace of timidity or self-distrust, but invariably took the aggressive, and seldom failed to carry his point. He made good practical use of his geological knowledge in investments and in services to capitalists; and he rendered two practical services of the highest value to the university. Becoming dean of the Lawrence Scientific School in 1891, he brought it forward in numbers and equipment as I believe no other department of the university ever has been advanced; and, through his friendship with the late Gordon McKay, he secured and shaped the greatest single benefaction Harvard or any other of the Eastern universities has ever received. With these two achievements, the first of which involved an enormous expenditure of energy in administrative detail, join the fact that he did rather more than his share of the work of teaching and that his principal lecture course was the most popular in the university, so that he had to move from hall to hall to find room for it, ending in Sanders's Theatre; then add this other fact, that during all the years of his deanship, he never failed to visit a student who fell ill—and the dimensions of his service to the university are perhaps fairly indicated.

IV.

As to the scientific work and writing which he nevertheless contrived to get done, even a layman can perceive that the volume of it was great and that a keen intelligence characterizes it all. Of course, a layman cannot estimate its thoroughness. That it could not be so thorough, or so likely to last, as if he had put all his time and energy into it, must, of course, be taken for granted. The antagonism between men of the type of Shaler and Norton—for in this regard Norton's practice was as incorrigible as Shaler's; he would discuss American politics in lectures on Greek art—and men of the other and conquering type of unrounded specialists, is palpable, no doubt, in all our greater centres of learning. It had to do, I tbink, with a sort of questioning of Shaler's scholarship, his thinking, his entire value, in fact, which grew commoner as he grew older and his intellectual habits became more marked, and as the unlikeness of his ways to those of the younger men about him became more striking. I have no doubt that he felt the challenge to him and to the older school, the older tradition, and responded to it; and of all his responses the most remarkable, and in a way the most convincing, was that experiment of verse which he made so astonishingly late in life, and on the whole with such astonishing success. "Valour"—his Phi Beta Kappa poem—and "From Old Fields" were attempts of a striking sort, but still of an audacity not entirely unexpected. The five longish plays in blank verse which make up the series, "Elizabeth of England," came as a surprise even to his intimates. Outside of a very limited circle of readers, they do not even yet seem to have become known at all. He himself calls them an experiment of his unknown powers, and explains that he made it to disprove the saying, based perhaps on a remarkable confession of Darwin, that long devotion to science and long practice of scientific habits of thought will destroy a man's capacity for imaginative writing. If the disproof fails, it is because Shaler was always more than mere scientist; not because he does not show real imaginative power in his verse.

One looks into "Elizabeth of England" expecting to find it a waste of fine energy upon an old man's folly. One is more apt to find one's self very soon asking, "If this is not poetry, what is lacking?" Prepared, perhaps, for a brilliant imitation of good verse, one is puzzled to discover a line that divides such an imitation as this from the thing it imitates. As a matter of fact, it imitates nothing; it would be hard to name a more original work in English verse in recent years in America. One remains doubtful, but not in the least inclined to scoff. Like many of the other things Shaler did, though it lies very open to criticism, and though we can easily take towards it an attitude of superiority, to match it were another matter.

And so it was with all his intrepidities; if those who smiled at them had ventured upon the like, they would seldom have found it easy to carry the matter through as well as he did. The sum total of the achievements of his life was very great; and of the man's final sincerity and genuineness there is no doubt. An unstudious youth, who had sat under him, made once the astonishing observation that he was "a simple-minded man," and it was true, little as he himself would have liked it. The strongest force in his nature was the little boy in his breast, crying out for understanding, and for human sympathy and liking. He gave much to life and won much from it; but nothing he won was finer than the strong personal affection that stirred in so many men's hearts when it was known that his was still. There was not one of them all that did not deeply echo what he wrote at the end of his "Elizabeth":

> Ah, here we know
> That sorrow vast and vain for ages gone,
> For beauty turned to dust, for voices still
> That waked forgotten love to ecstasy,
> For all the souls we know kin to our own,
> With whom we never can exchange a cry
> Across the gulf that parts us. Give to time
> His fill of our dear store; let to his sea
> Go down our treasured earth, and sun, and stars,
> Until the all is void, if he but send
> Back to our hearts the hearts of other days:
> Then will the spaces glow as never yet
> For all their orbèd splendours.

THE POLIPHILUS.

To the Editor of The Nation:

Sir: Professor Hart of Cornell University has taken up the question of the Poliphilus. (See the *Nation*, August 26). I think I shall add a few lines to the subject which may interest, and, I hope, must

interest, the readers or students of the art and literature of the Renaissance. Of course, I regret that my copies have been sold, not only for the reason of these words, but also because at long intervals this romantic volume—I mean romantic in the sense of a great personal meaning in the book; also romantic, because it is one of the most extraordinary books in the practical history of art—has been of great practical use to me.

How much its real influence at its date may have been exactly, I have not means of judging. Without an extremely full library of Italian books of the period, I could not tell in the direction of book information. I take it necessarily as granted that it must have had a great influence when one thinks of the French and English translations very close to the date, and that date the starting point of our settling into the formal lines derived from authentic or unauthentic old originals. Even the few words of Master Geofroy Tory imply the enormous importance of what Brother Francis Colonna did for the art and principles of decoration.

Therefore, I may draw attention to the French translation, which is more of an imitation than a translation, and whose value has been mostly that of the engravings, supposed to be "more correct than the original" and attributed many years ago to John Goujon, or else John Cousin. I do not know what the present correct notion is of their origin, but long ago they did not inspire full confidence in me.

I think the first edition is that of Kerver, 1546. There is another, also, by Zohory, and then another, much changed, by the abominable Béroalde de Verville. Certain French indecencies, which cannot be exaggerated, have both commended the book to collectors, and have turned away more scrupulous persons. Of course, as your correspondent mentions, there is the English translation, "The Strife of Louve in a Dreame," which is, as every one knows, the translation of the title of the Love Book. I have never seen the book or its pictures; it is of 1592, I think. I do not know Mr. Lang's reproduction, and am sorry for it. I know there have been unimportant translations, one from Didot's press, and it seems to me another which I used to have; not an early translation, a sort of account of the curious book.

Since my day of fifty years ago we must know, more or less, who did the drawings for the original Italian book. They were once attributed to John Bellini, as was the fashion of a certain moment. By this time, too, I suppose we must know all about Leon Crassus of Verona, who edited it. Your learned correspondent, Professor Hart, rightly draws attention to the fact that the original edition has in the colophon the date and place of issue as Treviso, 1467, while the last page gives us Venice, the month of December, 1499, in the modern offices of Aldus, *et cetera*. Perhaps, also, by this time that clue has been followed up. Italian catalogues of research are hard to find in ordinary New York life, so that I am writing to a learned scholar in Italy to get him to give me the last dates of information. But that is the line. We know that the Lady Polia was from Trevisa, and of the family of the Poli. Apart from everything else, the life story interests me; it should be impossible to cover up the history of life when we are learning, and I once sympathized in the story of another lost book of mine, in which the learned librarian, Charles Nodier, some seventy or eighty years ago, gave us along with the name of Trilby, a manner of describing our Poliphilus in an invented visit of the Lady Polia to Aldus after the date of her lover's death; she asked the famous printer to take charge of his memorial of their love. It was a pretty invention, and not so far out of the way as might seem.

I have sometimes amused myself by telling the first letters of each chapter of the book, which tell the secret. As we all know, the official name of the book translated is "Poliphilus, the Battle of Love with Sleep —Hypnerotomachia—wherein all human matters are taught as not being otherwise than dreams, and other things reasonably worth knowing, the book records (a work composed by Francis Columna)."

I have made a bungle at the translation, which is not easy, but which is mild compared to the text, written in the most extraordinary Italian, mingled with Greek, and even Hebrew and perhaps Arabic. There is nothing but singularity in the book; but of course, there is the secret. The secret is there in the capitals of each chapter. As I have said, it has been an amusement to me. I note the first letters of each chapter.

They go this way:

First Chapter,	P
Second Chapter,	O
Third Chapter,	L
Fourth Chapter,	I
Fifth Chapter,	A
Sixth Chapter,	M

etc., until you get "Poliam Frater Franciscus Columna Peramavit." "Brother Francis Columna loved Polia to distraction." That is the life story.

I have not referred to the French facsimiles published in the last twenty-five or thirty years. Popelin's volumes did not impress me. I might add that I used the book in the lessons which I gave in the years 1892 and 1893 for the Metropolitan Museum on the Lazarus Foundation. The museum wished to close its teachings in some manner of attracting attention. I taught to give a winner or winners of prize a chance of foreign travel and study on the foundation. The lessons had to be given at different places and intervals, the point of the teaching being to carry out the previous training of each pupil. I even had one in New Haven, whom I had to visit and give lessons to in the open air because he was a "plein airiste." Thereupon I was also asked to give lectures, which I did, and which were published by Macmillan & Co., under the title of "Considerations on Painting."

I learned last night that there are three wonderful copies of Poliphilus in Mr. Pierpont Morgan's library. I am offered one for $400.

New York, August 31.

NATURE AND SCIENCE.

TO THE EDITOR OF THE NATION:

SIR: It seems a little singular that the love of natural scenery should be almost coeval with the age of modern science. Has the fact been generally noticed? And is the reason hereafter assigned a sufficient explanation?

Josselyn, one of the earliest travellers who saw the White Mountains, speaks of their appearance as "daunting terrible." Father Hennepin, the first white man who saw Niagara Falls, thought the sight "hideous" and the roar "infernal." John Woolman, called by Henry Crabb Robinson "that beautiful soul" whose writings are "a perfect gem," makes special mention in his Journal of being preserved in safety in one of his missionary tours to the Alleghany region, "by the kindness of Him whose works in these mountainous deserts appeared awful." Jefferson, in his Notes on Virginia, applies the epithet "terrible" to the romantic pass of Harper's Ferry.

Washington Irving, in his tales of Rip Van Winkle and The Legend of Sleepy Hollow, was almost the first to transfer the beauties of American scenery, as on the Hudson and among the Kaatskills, to the printed page. In fact, memory does not recall one of the earlier explorers and travellers in our country down to the time of President Dwight, who speaks of its magnificent scenery with admiration. Barber's Historical Collections of Massachusetts and Connecticut, published early in the last century, have many woodcuts of villages and buildings, but natural scenery is represented on the most limited scale and in the rudest manner, and little allusion is made to it in the text.

The reason of this is, perhaps, not far to seek; it is small wonder if the early settlers along the narrow strip of Atlantic seaboard saw little to enchant them in the dark and pathless wilderness that stretched toward the setting sun, filled with real and fancied perils, with wild beasts and wilder men, and brooded over by everlasting mystery. But the same is true of England, with its much older civilization. Milton loved a gentle pastoral landscape, such as met his gaze at Horton:

> Meadows trim with daisies pied,
> Shallow brooks and rivers wide;

but when it comes to the Welsh border, in "Comus," he sees only

> . . . the drear wood,
> The nodding horror of whose shady brows

affrights the belated wanderer. The earliest guide book to the Lake country, in 1774, speaks of "the most horrid romantic mountains" about Borrowdale ("fantastic," is Coleridge's epithet). Not until Wordsworth came to interpret its beauty did the district attract pilgrims and admirers; and the Peak country in Derbyshire was regarded in the eighteenth century, that gilded and affected age, much in the way Johnson regarded the Highlands, as a rough and forbidding region, fit only for savages. Gibbon described Caledonia as a land of "gloomy hills and cold and lonely heaths." Goldsmith, alive as he was to the charms of Sweet Auburn, had a resentment against "hills and rocks that intercept every prospect." Scott first invested the region of Loch Katrine with beauty and opened up the heart of the Trosachs to the Sassenach, which had before been dreaded as enchanted land strewn with the wild ruins of primeval chaos. Cowper, gentle bard, writes in 1777 of the beauty of the Isle of Thanet, and at Eartham he glows at sight of "an inland valley, enclosed by magnificent hills, all crowned with wood";

but Cowper's taste was for the pretty rather than the sublime, and he never saw any but the softer features of England's scenery.

In a word, the old Virgilian conception of "shaggy," "bristling," and "horrid" woods, and crags, and mountains held its ground well until nature ceased to be a name for the mysterious and tragical; and men began to see in it something beside an object of terror, and to gain some control over forces which seemed ready to crush and overwhelm them with their vastness and their unknown powers. It is significant that the age of modern science and of the admiration of the great and sublime in nature almost exactly coincide.

HANGING A HORSE.

To the Editor of The Nation:

Sir: The following account of the private trial and execution of a horse by command of the fantastic Marquis de Briqueville may be of interest in connection with the discussion in these pages of the "Trial of Animals." The extract is taken from an article entitled "Biographie des Excentriques," originally published without signature in *La République du Peuple,* described as "Almanach Démocratique, Paris, chez Prost, 1850," and republished in "Œuvres Posthumes" of Baudelaire, Paris, Société du Mercure de France, 1908. The article is evidently one of Baudelaire's bits of hack work, but even here the master's touch is felt :

First of all let us mention the Marquis de Briqueville, a very rich person, popularly deemed crazy and probably slightly so; at least, he did all that was necessary to justify the opinion one had of him. One day, as he was rushing violently through the streets in his brilliant equipage, one of his horses fell; the carriage was upset, and the marquis received an ugly contusion. He is brought back to his mansion; he is in a rage; he wants to dismiss his coachman. The latter justifies himself; the accident was not caused by any fault of his; one of the horses is to blame. "If it is so," says the marquis, "the horse must be punished; every fault must have its penalty." He orders all his household to appear; steward, butler, valets, scullions, grooms, it is a veritable court of justice. They all take their places. The marquis presides. The accused is brought in; he preserves in his noble bearing the calmness of innocence. The coachman makes the accusation; the secretary of the marquis, filling the office of lawyer, presents the defence of the quadruped. He is long-winded, heavy, flat, exactly as if he was pleading before Parliament; he quotes the Digest, he spits Latin; he concludes by requesting that his client should be returned to the stable whose finest ornament he is. The case is heard. The marquis gives his opinion first; he considers the accusation as proved; he votes for the sentence of death. All his valets hurry to vote like him; the whole thing seemed to them a joke; they were mistaken. The marquis had a scaffold erected in his yard; he addressed to the condemned a prolix discourse, in which he made him feel the enormity of his crime. During this oratorical display the unfortunate victim looked upon the instrument of torture with a firm eye. No affectation of courage, no despondency.

As soon as the marquis had finished, a groom threw, with dexterity, a rope around the neck of the patient, and a few seconds later the poor animal was suspended in the air, the coachman was pulling his feet down, a valet was stamping on his shoulders; the hanging was as correct as those daily exhibited in the square of the Grève. The attendants were stupefied with astonishment.

To those who care for Baudelaire, the "Œuvres Posthumes" is a little treasure-house, filled with hits of broken beauty, tender tribute, acid and illuminating comment, and penetrating humor. W. E.

Washington, D. C., August 31.

ANCESTORS.

To the Editor of The Nation:

Sir: The love of ancestors is said to be a peculiarly characteristic trait of the Chinese, but the question has been forced upon me whether the determination to have ancestors at any cost was not possibly becoming an American characteristic. Indeed, its rising tide has come so ominously near to me personally that I am forced to seek for protection. Since 1906, when my public relation to a memorial to James Wilson, the signer and constitutionalist, made it natural, and especially since I have been preparing his "Life and Works," I have been besieged by those who have varying degrees of this ominous characteristic. Some modestly wish to know whether they are descendants of the signer—a stage of progress that is not necessarily dangerous, and yet I would advise no one to dally even in that apparently harmless state. I am justified in this advice by the acute forms which have come under my own observation. In one instance a party was so determined to have James Wilson for an ancestor that appeal was made to several eminent Philadelphians and even to the Governor to prevent the loss of so distinguished an acquisition in ancestry! It was of no moment that the will of this ancestor, "James Wilson," did not tally in dates, children, or most other features—one would not be defrauded of an ancestor in silence! Another took no chances of such a wicked conspiracy, but just held on to the said ancestor and became a member of a national society on that basis. Another gravely had an eminent bishop write to me for a similar purpose, reasoning that a bishop's endorsement was a title deed to the "ancestor." I suppose I have been appealed to in these unfortunate cases on an average of about twenty-five times a year during the period mentioned. And one can imagine how heart-breaking it becomes when to each questioner one must reiterate: "I am sorry to say that James Wilson had but one child who married, and but one grandchild of that union, and she died unmarried, while, it need hardly be added, all descendants have passed away years ago." A letter of Wilson's oldest son, the Rev. Dr. Bird Wilson, who survived all the rest of Wilson's family excepting the granddaughter mention d, states the case. It can be seen at the Historical Society of Pennsylvania, and the facts have been generally so well known by those who have been familiar with Wilson material that these claims have always been amusing—except to the one to whose lot it has fallen to write the above sad reiteration. I do not wish to assert that the determination to have ancestors at any cost is a national characteristic—not yet.

Burton Alva Konkle.

Swarthmore, Pa., September 6.

Notes.

It is interesting to hear that John Lane Company will bring out an edition of Dr. Johnson's Poems, with an introduction by William Watson. Mr. Lane has also the manuscript of a new volume of poems by Mr. Watson, to appear early this autumn.

From A. Wessels we are to have a life of Corot by Everard Meynell.

Harper & Bros. announce that a new book by Sir Gilbert Parker will come from their press early this autumn. The title of the novel is not yet given.

Sturgis & Walton will soon have ready "The Great Wall of China," by Dr. William Edgar Geil. The author is the first foreigner who has traversed the entire seventeen hundred miles of this wall, and his account of the journey ought to be interesting.

For travellers and others the Oxford University Press has issued a happy little anthology of verse under the title of "The Englishman in Italy." It includes not only poems about Italy, but the work of men who have loved the land. Thus space is made for such a poem as "Adonais," as much for the reason of Shelley's residence in Italy as because Keats was buried in Rome.

Three new volumes in E. P. Dutton & Co.'s "World's Story Tellers" bring us the work of Balzac, Chateaubriand, and The Essayists (*i. e.*, Overbury, Earle, Steele, Addison, Johnson, etc.). The editor, Arthur Ransome, furnishes introductions to these, as to the earlier volumes.

The Rev. P. W. Browne's "Where the Fishers Go: the Story of Labrador" (Cochrane Publishing Co.) may be described as an historical guide-book to Labrador with a personal note imparted by the fact that the author, in the course of his ministerial mission, was able to visit nearly all the settlements of the forbidding coast. These are well described: the historical notes are sufficiently detailed, and there are full chapters on the flora and fauna, the aborigines, trade statistics, and directions for sportsmen and tourists. In fact, it would be difficult to discover a single volume in which so much information is contained, and for this reason the book may be heartily recommended to travellers to the northlands. Mr. Browne, while straightforward and clear, makes no pretence to fine writing, and we can therefore the more easily forgive him the many slips which the book contains, such as *laurus* for *larus* (gull), the reference to Kipling's "*muddled* oafs" (!), and the lack of consistency in spelling the names of places, tribes, etc. The volume is poorly printed, and copiously, though badly, illustrated.

Prof. Paul S. Reinsch's "Readings on American Federal Government" (Ginn & Co.) is an interesting attempt to adapt the source method to the study of an important department of political science. The material, drawn chiefly from the much-abused *Congressional Record* and from departmental or official reports, has been chosen with admirable skill and covers a wide range, hardly any topic of present-day importance in the practical working of the Federal system being unrepresented. As compared with history or economics, the

difficulty of selection is peculiarly great, for the reason that, in matters of government and administration, change is often quite as important an element as accomplished fact, and discussions and events significant today are likely to seem of less moment five years from now. It may be doubted whether, for example, such illustrative extracts as President Roosevelt's summary of the work of the Department of Agriculture, in his annual message of 1904, or the reports of the Bureau of Corporations for 1904 and 1906, will continue very long to be the typical illustrations of the development of Federal power that they admittedly are now. For the present, however, the serviceableness of Professor Reinsch's book to the teacher and student, whatever the range of library facilities at command, can hardly be over-estimated, and we are glad to give the work hearty commendation.

The title of William F. Gephart's book, "Transportation and Industrial Development in the Middle West" (Columbia University Press), would have been more accurately descriptive if the State of Ohio had been used to indicate the geographical limits of the study. To be sure, in the eighteenth century and for a time in the nineteenth, Ohio was almost all the West there was, middle or otherwise, but, inasmuch as the history is traced far enough into modern times to include the interurban railway, the title is likely to be misleading. For attention is almost wholly given to this State, and wherever the discussion reaches beyond its limits, it invariably has its basis in this one locality. The book is an interesting and careful investigation, more exhaustive than has been published heretofore, of the evolution of industry in the State of Ohio and of the close relationship between this development and the progress of transportation. The unique position of Ohio in the growth of the West is attractively presented. First came the pioneer, who, after struggling to reach the headwaters of the Ohio, constructed his varied craft and quickly buried himself in the heart of the continent. With the coming of the steamboat, river navigation took on a commercial aspect, and southern Ohio became a region of industrial activity. The opening of the Erie Canal made close union with the lakes desirable, and canals were dug north and south across the State. Then came the railways, diverted southward by the lakes and northward by the mountains, finding here their most advantageous gateway to the West they were seeking. Finally, Ohio, not content with these facilities, has developed, as have few other sections of the world, the interurban railway, and is now leading the movement for the restoration of the waterways. The volume contains several helpful maps.

Prof. C. H. Grandgent of Harvard has published in Heath's Modern Language Series the first volume, the "Inferno," of the first annotated edition of the "Divine Comedy" in the Italian text ever undertaken in America (D. C. Heath & Co.). He states that his intention is to reach "the general literary public," but that he has also adapted his book "to academic use," and we cannot but hope, not only that reading of Dante will be encouraged in literary clubs and cultured circles generally, but that the study of Italian in our colleges will be stimulated and somewhat systematized and extended. A good text-book must make for the latter end, and a good text-book this volume ought to prove. The text is based, but by no means slavishly, upon the latest edition of the "Oxford Dante," and the annotation, while abundant, is discreet in its avoidance of encumbering erudition. Professor Grandgent has aimed to enable readers and students to dispense, for the comprehension of the poem, with every other book "save their dictionary." This doubtless means their Italian dictionary, but there are numerous untranslated Latin quotations which may puzzle some aspiring souls, while, on the other hand, many a note will save a lazy student from a visit to a classical dictionary. On the whole, we think it would be difficult to improve upon the annotations with respect either to their omissions or to their inclusions; and in their succinctness and, so far as our tests go, their accuracy, they are models of what notes should be. It should also be added that they furnish a large amount of carefully selected bibliographical information calculated to stimulate both reading and research. Perhaps, however, the notes yield in merit to the introductions prefixed to the cantos. These furnish comment, explanation, and discussion of special difficulties and show the learning and the balanced judgment of the editor to the best advantage. The general introduction gives a life of Dante and discusses his character and works in a sound and catholic fashion.

Charles Roessler discovered in 1901, in the vaults of Saint-Denis, a slab bearing an effigy of the famous armor dedicated "à monseigneur Sainct-Denis" by Jeanne d'Arc after the assault on Paris. He confesses that for some years he did not realize that it was *inédit*. In publishing it ("Jeanne d'Arc, Heroine and Healer," Williams and Norgate, London), he takes occasion to review the maid's career from the orthodox point of view, and to present a rather uncritical version of the most significant passages from the trial. Although the book bears the date of 1909, the reader must suppose that it was written some years earlier, or else that the author has lived a life of singular retirement. He presents the touching spectacle of a child picking daisies on a battlefield as he culls his favorite passages, unaware that he is between the terrific batteries of M. France and Mr. Andrew Lang. The publishers' advertisement describes M. Roessler as "one of the last universal archæologists." It should seem that a universal archæologist could not be too particular, yet his sweep has failed to acquaint him with the sly genius of Edward Gibbon. We can imagine the demure joy with which that historian would learn that M. Roessler, in support of the statement that for centuries the Christian church healed the sick and raised the dead, cites in good faith the famous sentence:

> But the miraculous cure of diseases of the most inveterate or even preternatural kind can no longer occasion any surprise, when we recollect that in the days of Irenæus, about the end of the second century, the resurrection of the dead was very far from being esteemed an uncommon event.

Nobody better fitted for the task of translating Cæsar's "Commentaries on the Gallic War" (The Macmillan Co.) could be named than Dr. T. Rice Holmes. His version was begun some years ago, and postponed until he had completed the investigations, since presented, to the delight of the scholarly world, in his "Cæsar's Conquest of Gaul" and "Ancient Britain and the Invasions of Julius Cæsar." The work before us, therefore, is more than a translation; it is a summary of elaborate research. Footnotes are added where the text needs elucidation in matters historical and military, or the manuscript readings require discussion. Dr. Holmes speaks of the occasional carelessness of Cæsar's style, and believes that he did not revise his histories. The remark needs qualification in the light of Dernoschek's studies, which show that while the "Civil Wars" and Book vii of the "Gallic Wars" were not revised, Books i-vi of the latter work were subjected to thorough reëditing on the basis of certain grammatical theories that Cæsar held. But whether Cæsar's carelessness be intentional or not, carelessness is not intentionally reproduced in Dr. Holmes's version. It is clear and straightforward, with no endeavor for effect of any kind, and with none of the vulgarity of an up-to-date phrasing. It has not that imperial quality which gives the prose of Julius Cæsar distinction, and it misses the slightly satiric flavor which appears now and then, as in the description of the Gallic hosts and their numerous commanders-in-chief before Alesia (vii, 76).

But not to speak of unattainable goals, Dr. Holmes's work is one to which the general reader may profitably turn and which every teacher of Cæsar should study with care. In his preface, Dr. Holmes urges the prescription of Cæsar's Commentaries in the entrance examinations for the English military institutions at Woolwich and Sandhurst, rightly thinking it better for students at these places to know a few great authors well than to cull from a handbook information about Latin literature at large. The remark might be pondered by those American teachers who would "diversify" the high-school programme of the second year by miscellaneous substitutes for the dull pages of Cæsar. Nothing can be made interesting if Cæsar is not, and to one who sees not why, the various publications of Dr. Holmes may be recommended. The present book gives perhaps the readiest clue to the results reached in his previous works. It is equipped with an index of proper names and important military and political topics.

Anyone who has given twenty minutes to travelling by the elevated railway over the short distance between Friedrich Strasse, Berlin, and the suburb Charlottenburg, or has bumped along parallel to the peasant and his drove of cattle in one of the hoasted *Schnellzüge* in Germany—all apologies to the two or three really fast trains in the Fatherland!—will see the need of some radical reorganization of the whole railway system such as August Scherl suggests in "Ein neues Schnellbahnsystem," a richly-illustrated portfolio just issued by the author at Berlin. Scherl, who is known for his great publishing enterprises and activity in reorganization of public undertakings in Germany, comes out unreservedly for a single-track railway, not

of the type here and there already introduced in Europe such as the famous Schwebebahn—but one placed on solid banks of masonry throughout the land, and elevated far above the houses in the cities, where the highest possible speed may be attained, and the largest number of people and districts served. There, with trains balanced automatically by appliances within the cars themselves, Scheri looks for a speed of quite 200 kilometres, or 140 miles an hour, and all compatible with absolute safety and the greatest comfort. He would have a central station in Berlin, and would lead the various lines of railway out like spokes radiating from a hub, extending the branches clear into Austria, Switzerland, and across the Rhine, so that Bremen, Cassel, Prague, Breslau might be reached in about two hours, Innsbruck in about four, Flushing in about six, and Geneva an hour later. Scheri believes in the importance in social life of quick intercommunication, and holds quick travelling to be, after all, the cheapest; and in his efforts to provide for all possible conditions and demands from a somewhat humored public, betrays his indebtedness for many ideas to American railways. Passing by the main feature of the new system—the single rail, which Scherl admits will require some new engineering—the points of superiority are the centralizing of the lines and stations, the facility of junction between one railway and another, and the removal of dust and noise, as disturbing factors, from the experience of the city resident. A good deal of cleverness is shown in the economic distribution of the space for passengers within the cars and the stations, the offices of administration, etc., and the volume contains numerous plates calculated to instruct the laity as well as assist the engineer. Now that Scherl, at one stroke, has thrown down the gauntlet to all the theorists of the old and "scientifically educated" school, a flood of heavy and threatening brochures from opposing Germans may be expected in return. The ultimate result will probably be some increase of speed in railway travel in Germany.

A noteworthy publication in numismatic literature is the recent work of Ferdinand Friedensburg, entitled "Die Münze in der Kulturgeschichte" (Berlin: Weidmann). This book does not offer any new coins or new interpretations of inscriptions; but takes the rich data already on hand and shows the importance of coins as expressions of culture and civilization, business and commerce, religion and thought.

The rapidly increasing number of students and investigators in the particular field of water transportation will welcome the second volume in a series of technical economic monographs, edited by Dr. Ludwig Sinzheimer, lecturer in political economy in the University of Munich. The author is Hermann Justus Haarmann, who, in "Die ökonomische Bedeutung der Technik in der Seeschiffahrt" (Leipzig: Werner Klinkhardt), discusses both the direct and indirect effects of the progress of technical knowledge upon the development of water transportation. After considering the recent history of the development of vessels with respect to such matters as the increase of their carrying capacity, safety, and speed, he gives particular attention to their equipment and to the changing function of the officers and crew due to modern methods and conditions. The series will include studies in a variety of subjects, particularly of such industries as milling, sugar, glass, brick, chemical, and others of interest to students of economics and the general public as well.

"Gl'Italiani negli Stati Uniti del Nord" (Milan: Libreria Editrice Milanese), by Dr. Giovanni Preziosi, ought to be widely read wherever Americans are concerned in the question of immigration. For various reasons, the rapid influx of the Italians during the last decade has forced this question to the front. The Italians are not, by any means, the lowest or the most undesirable of the foreigners who have been coming in: they were simply the first who came in great numbers and showed slight or no capacity for citizenship. Their language, their illiteracy, their racial traditions have proved thus far too stubborn. Through them, we have had thrust upon us the problem: Shall the United States of the future harbor various foreign elements, which have not been and cannot be assimilated? If it shall, what hope is there for American patriotism, and the perpetuation of American principles? Now it is because Dr. Preziosi shows us clearly just what sort of material the Italian immigrants offer, that his book is so interesting. He has thoroughly studied the Italian colonies over here. He writes without prejudice. He puts his material clearly, and is familiar with the literature on the subject in both English and Italian. He deplores the evil reputation of his countrymen, and proves by statistics how little it is deserved. In New York city, for instance, in 1904, the Irish, with a smaller population than the Italian, had 1,564 of their number in the Blackwell's Island almshouse to only sixteen Italians. In 1902, 7,281 Irish were arrested in New York for drunkenness, and only 513 Italians; and so of other crimes. Dr. Preziosi admits frankly the too free use of the dagger by his countrymen among themselves, but he scouts the idea that there is a large criminal organization like the Black Hand. Its supposed intimidations and violence, he attributes to unorganized criminals, who have discovered the money value of pretending to belong to the mysterious society.

But it is the normal life and labor of the Italian immigrants that Dr. Preziosi's report deals with most amply. Their industry, their sobriety, their thrift, their patience and long-suffering under cruel hardships, he paints without exaggeration. He describes the many ways by which they are exploited: the function of the *banchista* and *padrone;* the utterly inadequate efforts of the few humane persons in each centre to relieve or protect the victims. Massachusetts was the first State to pass a law, adequately regulating the exploiters, and it is evident that every State, in which great numbers of Italians congregate must, for self-interest, take steps in their behalf. We entirely concur in Dr. Preziosi's conclusions that the paramount remedy is education. If the immigrants had a proper public school training in Italy, they would either not leave home, or they would find it as easy as the Germans and Scandinavians have found it on coming here to make a comfortable living. Once in the United States, they should fit themselves as rapidly as possible—by learning English and by adopting our ways and political ideals—for American citizenship; because until they can read and write, they must remain at an economic level hardly above serfdom. Dr. Preziosi's book ought to be translated.

From Turin comes the report of the death, in his eighty-ninth year, of Carutti di Cantogno, an historian and member of the Accademia dei Lincei.

Dr. Adolf Kamphausen, professor of Protestant theology at the University of Bonn, has died at the age of eighty. He was for a time secretary to Bunsen, at Heidelberg, and after Bunsen's death, completed his "Volständiges Bibelwerk für die Gemeinden," with the assistance of Holtzhausen. He has also to his own credit a considerable list of books on the Old Testament and other religious topics.

PRINCIPLES OF TAXATION.

The Methods of Taxation, Compared with the Established Principles of Justice. By David MacGregor Means. New York: Dodd, Mead & Co. $2.50 net.

"No one is satisfied," as Mr. Means remarks, "with the practical methods employed in assessing and collecting taxes"; but "there is little agreement concerning the reform of these practices," and we seem to be about as far removed from such agreement as people were a generation ago, when serious discussion of the subject began in the United States. A necessary preliminary to comprehensive reform is, undoubtedly, agreement upon underlying principles, and the present volume should contribute not a little to this end. If open to criticism at certain points, it is fundamentally sound at others; and is written in a clear and cogent style that must command admiration even where it does not carry instant or even ultimate conviction.

By "methods" of taxation, our author means principles of procedure, and his purpose is to compare the principles underlying present practices with the principles of social justice, in order to determine what taxes are just and therefore fit to be employed in an enlightened state. Of methods of taxation, he finds, there are three: the proportionate, according to which taxes "should be contrived with the purpose of taking from every subject the same proportionate part of his wealth"; the progressive, or "socialistic," by which "a part of the possessions of those who have greater wealth should be taken from them, and given to, or applied to the use of, those who have less"; and the economic, or fiscal, which aims "to procure the revenue of the Government with the least possible diminution of the revenue of its subjects." Before considering these, Mr. Means formulates the principles of social justice by which they are to be tested. Since every tax involves

some interference with property rights, this part of the inquiry necessarily concerns the institution of private property.

The occupancy theory of property he finds obviously unsatisfactory, and the labor theory is valid only for such an amount of property as is necessary to support life. Rights in property obtained by transfer must be recognized because of the evils that would follow uncertainty about titles. The institution of property, as we find it, is generally approved since it has conduced to progress and secured sufficient diffusion of wealth and comfort to give the average man a stake in its preservation. Property rights, however, are not absolute; in a progressive society they are subject to modification; and discontent with extreme inequalities of wealth leads to approval of certain changes. In a progressive society, therefore, "conflict between vested rights and the requirements of changed conditions is inevitable," the outcome being a "series of compromises between the forces of conservatism and progress." In taxation, then, as in other branches of legislation, we must give due consideration to the "reasonable expectations" of property owners, but without recognizing absolute rights of ownership. So-called "unearned property," whether acquired by prescription, inheritance, gift, or otherwise, is the form most likely to undergo modification; and "it does not seem to admit of question that most men think that a more equal distribution than now prevails would better accord with justice."

Admitting, however, that the present distribution of wealth is not ideal, it is not to be assumed forthwith that a better distribution can be produced by means of taxes. The proportionate method, even if capable of strict enforcement, would leave men relatively where they are to-day; and it is clear that if a redistribution is to be effected, resort must be had to the progressive method. To apply either the proportionate or the progressive methods requires "that the government should ascertain the amount of the wealth, or of the revenue, of every subject." The practicability of such a procedure is not to be assumed, but must be determined from experience.

Disclosure by property owners and inquisition by public officers are the two methods by which the amount of each citizen's wealth must be ascertained, and in taxing property or incomes governments have applied both methods and in as many forms as human ingenuity can suggest. From the history of the general property tax in the United States and the income tax in Great Britain, Mr. Means draws ample evidence of the difficulties attending either method; but the story is so familiar to American readers that it need not be considered here. The abuses arising under the general property tax have long been notorious, and the British income tax has always had its critics. Our author's conclusion is that, human nature remaining what it is, the attempt to levy either a proportionate or a progressive tax upon all property or income will always fail to attain justice between citizens, however the requirements of justice may be defined. He calls attention, also, to the further fact that so long as part of the public revenue is derived from taxes on consumption, the total contribution of each citizen can have no assignable relation to the amount of his property or income.

Taxes on consumption have sometimes been defended as just, on the ground that outgo is proportionate to income, and that by taxing the one, governments may tax proportionately the other, particularly, if care is taken to exempt absolutely necessary articles of consumption. But the arguments by which such views are supported are easily shown to be fallacious, and Mr. Means concludes that, while indirect taxes may be indispensable, "they can never be maintained to be just." Habitation taxes, which are merely taxes on one form of expenditure, receive a more favorable judgment; and our author concludes that, "with proper graduation and exemptions," a habitation tax "would seem more than any other to afford that equality of opportunity which justice is thought to demand." It "furnishes revenue to the government, it obtains much of it from the profusion of the extravagant, and at the same time enables the parsimony of the frugal to accumulate the wealth on which the prosperity of the society depends." Inheritance taxes are somewhat severely criticised by Mr. Means, who, in addition to the usual criticisms, suggests that the high rates now in favor may lead to evasion. He concedes, however, that "the death tax does not occasion the outrageous injustice of the general property tax," and that, "if it could be substituted for the latter, and graduated as the theory on which it rests requires, justice would be more nearly attained than at present."

Even if it were possible to ascertain the aggregate possessions or incomes of all citizens and then tax them at either proportional or progressive rates, the intention of the lawmakers would be frustrated by the process of tax shifting. Mr. Means holds in general to the diffusion theory of incidence. Taxes on property or income differ from taxes on production or transfers chiefly in that they are collected at regular times and at determinate rates. He recognizes, however, that this theory assumes "not only freedom of competition, but also an unlimited supply of materials at a constant price." This leads him to recognize important exceptions to his general principle that taxes tend to be diffused throughout the community. The first exception is a tax on ground rent, which falls upon the landlord; and another is a tax on the net receipts of a monopoly. In his opinion, the ultimate outcome is that "nearly all the charges levied on personal property and on trade fall eventually on land, and with enormously increased weight." Even the progressive inheritance and income taxes of recent times probably tend to check accumulation, raise the rate of interest, and so defeat the avowed object with which they are levied—the equalization of fortunes.

The proportionate and progressive methods of taxation being seen to be impracticable and utterly illusory, there remains only the economic method. Since it is useless to attempt to distribute the charges of government "with any approximation to justice," as defined by advocates of the proportional or progressive methods, the only thing that can be done is to "procure the revenue of the Government with the least possible diminution of the revenue of its subjects." From this point of view, general property and income taxes are to be rejected; and most indirect taxes are highly obnoxious on account of their tendency to hamper industry or commerce and because their cost of collection is excessive. Inheritance taxes are better than taxes on property or income, but hardly meet the requirements of an economic system. Taxes on real property, proportional to the rental value, "comply very perfectly" with these requirements; a habitation tax, if properly graduated, is also satisfactory. Further than this "the deponent saith not," and we are left with the conclusion that, while it may be necessary to make many compromises with popular ignorance or prejudice, only taxes on real estate and the so-called habitation tax square with the economic method of raising public revenue.

It would be interesting to follow Mr. Means into the detailed discussion of different forms of taxation from the standpoint of the economic method, but that must be left to the reader. His analyses and classifications are often out of the ordinary run, and are interesting even when they do not seem to improve on the usual methods of attacking the problems. The chapter on the "Cost of Collecting Taxes" is particularly valuable, and perhaps the best in the book. He should not have condemned income taxes so absolutely without making a careful study of the tax systems of the German States, and his proposal for a single direct Federal tax apportioned among the States of our Union in proportion to the aggregate local revenues or expenditures is highly fanciful. His discussion of discriminating taxes on corporations is valuable, but he is certainly mistaken when he

says that railways in opposing rate laws have always opposed particular rates and not the principle of regulation (p. 300). Study of the license taxes of various States would have led to a modification of the statement that the attempt to graduate liquor licenses has not been made in this country (p. 255). In his criticism of particular taxes, he has sometimes forgotten his own principle that "some inequality is inseparable from human life and from all taxation," upon which he has finally to fall back in his defence of the habitation tax (p. 271). But when these and other criticisms have been made, it must be recognized that Mr. Means has produced a stimulating, incisive, and valuable book.

CURRENT FICTION.

Anthony Cuthbert. By Richard Bagot. New York: Brentano's.

The matter of "Frank Danby" and the manner of the late Marion Crawford—so may be suggested roughly the quality of "Anthony Cuthbert." That is to say, it is a modern story of sex, told in a way at once simple and prolix. It makes no appeal to prurience, but it prides itself upon calling a spade a spade. Unfortunately, it is disagreeable without being impressive. Its chief episode, or situation, is by no means impossible, and the episodes which lead up to it are arranged with a good deal of ingenuity. But the whole thing strikes us rather as a clever study in an unpleasant type of fiction than as a wholesome and complete piece of art. It is a penalty of our story-madness that few novelists can afford to wait for a right inspiration; clever workmanship is all we demand of them. "Anthony Cuthbert" is distinctly below Mr. Bagot's previous performances. He has conceived an appalling thing; but his conception has appealed to him as striking possibility rather than overwhelming fact. He has fancied in it material for a narrative of the generous proportions still favored in England, and he has written such a novel, or what looks on the surface like such a novel. In reality, as he actually feels it, the theme is material for a *conte:* a Frenchman would have got the effect of pathetic irony with a tenth or a twentieth as many words. Tragic irony, an effect so sombre and profound as to justify his scale, Mr. Bagot certainly does not achieve.

The plot has the international (or, as it is usually called, cosmopolitan) element, which is just now, whether or not as a sign of our advance in civilization, so highly approved. England and Italy —Northumberland and Florence—supply the chief scenes with a sufficiently abrupt contrast. Anthony Cuthbert is a widower beyond middle age, rich, well-born, and childless. He has lived much abroad, and some years before the action of the present story begins, has wished to marry a Roman girl of noble family. A disgraceful intrigue prevents his success, and involves the girl in a shameful marriage, from which she virtually, though not legally, withdraws. Cuthbert has given up hope of winning her, and proposes to make a nephew his heir. Fate throws the nephew and the woman together in a brief moment of love-madness, neither being aware of the other's relation to Cuthbert. You see the rest: the brutal husband dies, the lady marries Cuthbert; the horror of the situation is brought home too late to "the guilty pair," who have not hitherto regarded themselves as guilty. The deaths of the nephew and the wife make easier Cuthbert's subsequent magnanimity, which remains, after all, a trifle unreal, a little too much like complaisance.

The Woman and the Sword. By Rupert Lorraine. Chicago. A. C. McClurg & Co.

This typical example of the swashbuckling school might have passed unnoticed a few years ago, but looms with some distinctness during the present vogue of introspective modernity. "Have at thee, caitiff!" will always touch a responsive chord in the more youthful register of one's emotional instrument, unless the chord be worn out by incessant thrumming. Mr. Lorraine has chosen his time well, but has somewhat rashly endeavoured to compress into one volume the bloody and violent deeds of a shelf-full; the pages reek crimson from the heroine's initial meeting with the hero, when she begins the bloodshed by biting him. After this, abduction, hair-breadth escape, and general carnage are the order of the day; subsidiary villains and such impedimenta are slaughtered right and left, and the book ends in a ruined tower, with a spectacular set-piece of gore, furnished mainly by the arch-villain, and a wedding at which the bride is most appropriately crowned with bandages, instead of the more conventional veil. The story as a whole, like so many of its school, is read with interest, and —perhaps ungratefully—ridiculed in the cold light of later judgment.

The Runaway Place. By Walter P. Eaton and Elsie M. Underhill. New York: Henry Holt & Co.

The authors call this farrago of sentiment, nonsense, and city-weariness a "May Idyl of Manhattan." The runaway place is Central Park, New York city. The runaways are a young man with literary longings, out of work, and an ambiguous young woman on her vacation, who responds from a summer-house to his whistled air from Mozart. Feeling out of tune with the elevated, troubled by certain nostalgic reminiscences of fields of daisies, and believing that only children can be romantic in the metropolis, they contract to be ten years old for the time being. Though they indulge deeply enough in peanuts, donkeys, and swan-boats, it cannot be said that they sustain their parts with a very childlike grace or spontaneity. What is meant for fun verges on silliness; what is meant for romance verges on "softness." There is a manifest attempt in various passages to suggest the whimsical melancholy of Heine; but his fine-edged wit is wholly wanting, and the suggestion is rather of the melancholy whimsicality of the humorous weekly, not to say the Sunday supplement. Perhaps the most amusing thing in the book is an interpolated story based on a difference of opinion between New Englanders and Manhattanese on the subject of doughnuts and crullers. The most serious thing is something called a *causerie* on "How to Be Happy Though in New York." Neither of the authors apparently has solved the problem. For beneath this self-conscious, over-literary, and curiously inartistic medley there is a genuine note of discord and the half-articulate pathos of uprooted things.

The Full Glory of Diantha. By Mrs. Philip Verrill Mighels. Chicago: Forbes & Co.

Diantha was fond of poetry, and a line came to her mind from the book she had been reading:

'Tis great—'tis great to be alone.

The title of the masterpiece to which Diantha is able to turn with such enviable readiness is not given, and one's fancy is teased as to the mate of the vouchsafed line. Perhaps

'Tis dandy without any one

is as reasonable a surmise as may be. However, the poem evidently expresses only a mood of Diantha's, for the chief and avowed object of her life is to find, not solitude, but "the man of her heart." She is not, be it understood, a simple village maiden, but a very good business woman, a bookkeeper, in fact, in the considerable city of New York. She is half-inclined to see the man of her heart in the junior member of the firm which employs her, and he is willing to be that. But she is not quite sure that he will do; she inclines to some one a little taller, stronger, more "elemental," and with eyes of a deeper blue. She puts it frankly to the junior member. There are a good many men whom she has had no chance to consider, and she has the suspicion that the man of her heart may be among them. The junior member is a good fellow, and promptly assigns her to a position in the office of a logging camp in the far West. He gives her six months to find her "knight

of old," and to bring him to New York for inspection; promising a liberal check by way of reward if the exhibit proves satisfactory. If she does not find the knight, she is to marry him, the junior member. The narrative which follows is too delightfully absurd to be dismissed as inane by the catholic reader.

ALEXANDRE DUMAS.

My Memoirs. By Alexandre Dumas. Translated by E. M. Waller. With an Introduction by Andrew Lang. Vol. VI. New York: The Macmillan Co. $1.75 net.

With the issue of the sixth and final volume, the Memoirs of Dumas, *père*, in Mrs. Waller's translation, reach the year 1833. Their author lived on until 1870; his most remarkable work in the novel was done in the years 1844-1850: we have, then, a memoir which devotes two hundred pages to the writer's father, without carrying us beyond the thirty-first year of the writer himself. But as the work aggregates some three thousand pages, we would not complain of its slightness. This bulky production is in no sense of the word "composed." It is simply the repository of numerous anecdotes, *mémoires pour servir*, and such cuttings from journals, plays, and poems (not always the original work of Dumas himself) as lay at hand. Had another than Dumas written his Memoirs with equal scorn of form and proportion, the work would have been unreadable. As it is, the dramatic sweep and the male vigor of Dumas dominate every page, giving the whole something of a factitious unity. Through these volumes march and countermarch legions of men of state—men of the barricades, men and women of stageland, men of letters, painters, journalists. We can only compare "My Memoirs" with the other works of the novelist; and if we place his story of himself below his avowed fiction, that must be because it is, here, not a single story, but a batch of unrelated romances—romances political and literary, romances real and romances ideal (*i. e.*, stories dressed up in cocked hats): all of them bound up together under a single title. "My Memoirs" is not one book, but many.

The man revealed in these Memoirs is generous to a fault: not in matters of money and hospitality alone, wherein he was a gull, but in sympathy no less. There is nothing grudging about his recognition of genius greater than his own. Dumas never failed to give Hugo all credit for his powers as lyric and dramatic poet. One reason why his Memoirs are, in their literary comment, indubitably thin, is the fact that he overrated almost all of his contemporaries. Speaking of an obscure collaborator, Dumas once remarked: "There is just something he lacks—I can't define what it is—to make him a man of talent." "Perhaps he lacks the talent," some one suggested. "*Tiens!*" said Dumas; "well, perhaps you are right. I never thought of that!" The novelist would have been far from resenting the imputation that he was weak in the critical faculty. "Criticism," he observes, "which does not produce children of its own, only picks up and fondles orphans which it can adopt; but it turns, angry and growling, on those children who are supported by a vigorous parentage." Even in his quarrels and duels, quite as in his literary controversies and opinions, Dumas was boyishly precipitate rather than captious or ungenerous. And though he was not given to introspection, it is one of his own pages that gives us the secret of his personality:

> With me gayety of heart is persistent, not the light-heartedness which shines through grief . . . but [that] which shines through the worries, material vexations, and even lesser dangers of life. One has a lively imagination because one is light-hearted; but this imagination often evaporates like the flame of spirits, or the foam of champagne. A merry man, spirited and animated of speech, is, at times, dull and morose when alone in front of his paper with pen in hand. Now work, on the contrary, excites me; directly I have a pen in my hand, reaction sets in; my most freakish fancies have often sprung out of my dullest days, like fiery lightnings out of a storm.

It is the author of twelve hundred volumes who speaks!

Although the translator of "My Memoirs" has rendered Dumas's unstudied prose into English that is always readable, she has not wholly escaped the marring solecism. She has been erratic, too, in sometimes translating, sometimes leaving in the French, phrases and passages. The texts quoted here at length cry out for more careful proof-reading: the errors are so glaring and so numerous in the final volume that it would be tiresome to enumerate the half. Yet the fact remains that, whereas we had, before, but two volumes of selections from the Memoirs, Englished by Mr. Davidson, we have now their whole disordered mass. They are, when all is said, as amusing—as spirited—as dramatic—as Mr. Lang has claimed in the entertaining essay with which they are prefaced.

Science.

The American Flower Garden. By Neltje Blanchan. With planting tables by Leonard Barron. New York: Doubleday, Page & Co. Edition limited to 1,050 copies. $12.50.

For many years there has been an opportunity for some one to write a book which should translate the spirit and practice of American gardens as William Robinson notably, and others less preeminently, have done it for English gardens. It was with this avowed purpose that the present work has been undertaken. The book is 8½ by 10 inches in size, is printed in a highly attractive and readable Caslon old-style type, on heavy, water-marked paper, and is illustrated with ninety-six full-size photographic plates and ten in color.

The demand for such a work is no doubt sentimental and æsthetic. Sensible, practical directions for gardening are contained in it, to be sure, but such as can be had much more quickly, fully, and scientifically by consulting Prof. Bailey's "Cyclopedia of Horticulture." However, as the sentimental and æsthetic side is nearly the whole game in amateur gardening, we may rejoice that such a book has come into existence. To the wealthy place-owner, into whose hands this *édition de luxe* will for the most part go, it will prove a welcome guide, interpreting the efforts of his landscape architect and his gardener. To the skilled amateur, *épris* of his art, it will come as the sympathetic and confirmatory outpourings of a fellow garden-lover; and to the person who merely loves flowers as the material of exquisite pictures, it will appeal by its charming and artistic illustrations.

Neltje Blanchan, to whom we owe the imaginative part of the writing, is already well known as the author of an excellent book for identifying wild flowers ("Nature's Garden"), and of other works on bird and plant life. The general plan of her chapters may be gathered from her treatment of "The Wild Garden": First, she touches on the abstract idea, and tells what an ideal wild garden might be and what such gardens have actually been in the past; then she describes some of the most useful materials for a wild garden, interspersing the story with the practical knowledge necessary to the making of one. After each chapter follow the planting tables, by Leonard Barron, which, though not by any means exhaustive, give all the best flowers, and fully as many as anybody but Crœsus has any business to try.

A great deal was predicted for the illustrations in the present work, and the untinted ones are all that could be asked. But the colored plates are a disappointment. Photographs of a high order they undoubtedly are; but color is strongly associated with idealism, and this quality is largely lacking. Perhaps if we did not have the wonderful crayon color sketches by Miss Margaret Waterfield in the English volumes of a similar sort ("Garden Color" and

"Flower Grouping in English, Scottish, and Irish Gardens") we should feel better satisfied. In some plates the colors do not register with exactitude. However, it must be admitted that the process used gives the correct values of the flowers, which is more than can be said of the seed catalogues or the hand-colored plates of the florists. On the whole, this is such a satisfactory book and fills such a unique place in the literature of American gardening that we cannot help hoping that it will be put out soon in a popular edition.

In the many divisions of engineering courses in the universities and colleges of this country, the course leading to the degree of sanitary engineer is the most recent, and it is likely to become one of the most important, dealing as it does with the preservation of human life. Books on the subject are few at present, but they are certain to be more common as the demand increases. Two recent publications, by W. P. Gerhard, are "Sanitation, Water Supply, and Sewage Disposal of Country Houses" (D. Van Nostrand Company), and "Sanitation and Sanitary Engineering" (published by the author). The former takes up the subject in the title in simple terms, gives the experiences of the leading sanitary experts, and describes fully and comprehensively the various methods adopted. The latter is an enlarged second edition, deals with the subject in general, and is intended to show the benefit of proper sanitation, by the experience of cities which have adopted modern methods. Both are valuable, but the hints to builders of country homes will probably be of greatest use to laymen.

The death is announced, in his sixty-seventh year, of Otto von Bollinger, rector of the University of Munich, and principal of the Pathological Instituto connected with it. His published works include "Die Kolik der Pferde," "Zur Pathologie des Milzbrandes," "Ueber animale Vaccination," and "Atlas und Grundriss der pathologischen Anatomie."

Drama and Music.

In "The Melting Pot," given for the first time in New York at the new Comedy Theatre Monday evening, Mr. Zangwill goes at a difficult subject with a light heart. The product of his dramatic melting pot was an unstable compound of melodrama, farce, burlesque, and rhetoric. That this country is the crucible in which the races of the world are destined to blend into the perfect human type, is the compliment which Mr. Zangwill lays at Columbia's feet. But he fails to demonstrate just how the future amalgamated American superman is to come about, or why, or when, or where. This play of the young Jewish musician, Quixano, who has experienced the horrors of Kishenev, but who is now ensconced with his uncle and his grandmother "in the Borough of Richmond," has neither progressive action nor development of character. And Mr. Zangwill has appropriately placed his unreal characters in improbable situations. Mr. Zangwill's conception of this country's function as a melting pot is literal. America is the crucible only, and contributes nothing. But it is plain that when a Russian youth and a Russian maiden meet in Staten Island and marry, we have not witnessed an example of true assimilation. Walker Whiteside plays the rôle of David Quixano well. The author has not given him a character to interpret but a large number of rhetorical selections to deliver. Mr. Whiteside has wisely taken the bull by the horns and goes through his part in a fine oratorical frenzy, though even his pleasing voice and physical restraint cannot save David from being a bore. Miss Crystal Herne as Vera Revendal succeeds in coming nearest to the natural. She is beautiful, and by voice and gesture gives expression to the spirit of poetic youth.

From Châlons-sur-Marne, France, comes news of the death of Clyde Fitch on September 4; his death having closely followed an operation for appendicitis. Clyde Fitch was born in New York city, May 2, 1865. As an undergraduate at Amherst College (where he received the bachelor's degree in 1886, and in 1902 the honorary degree of master of arts), he gave signs of literary aptitude. An apprenticeship as a writer of magazine stories for children, and as newspaper reporter, was followed by the scoring of an instantaneous (though anonymous) success as author of "Beau Brummel"—a play written for Richard Mansfield. Mr. Fitch wrote in all some fifty-four plays; all these in the course of less than twenty years. It is characteristic of the dramatist that, industrious as he must have been to establish such a record, austerity and aloofness were qualities that he never adopted. His secret lay, doubtless, in his ability to work under all circumstances and at all hours. A keen theatrical instinct found no small part of its expression at rehearsal, and in a tireless surveillance of "properties" and "business." The dramatist's mastery of the minutiæ of stagecraft, and his ease in giving to his work the note of "timeliness" dear to his public, conspired with his larger efficiency to make many of his plays uncommonly successful. Among the original plays by Clyde Fitch are to be numbered, besides "Brummel" and the one-act comedy "Frederic Lemaitre," "Betty's Finish," "A Modern Match," "April Weather," "His Grace de Grammont," "The Career of Betty Singleton" "The Moth and the Flame," "Nathan Hale," "Barbara Frietchie," "The Cowboy and the Lady," "The Climbers," "Captain Jinks of the Horse Marines," "Lovers' Lane," "The Girl and the Judge," "The Way of the World," "The Last of the Dandies," "The Stubbornness of Geraldine," "The Girl with the Green Eyes," "Her Own Way," "Major André," "Glad of It," "The Coronet of the Duchess," "The Woman in the Case," "The Truth," "The Straight Road," and "The Girl Who Has Everything." Among his adaptations were "The Masked Ball," "The Head of the Family," "Cousin Billy," "The House of Mirth," and "The Blue Mouse."

A work of peculiar attractiveness for lovers of music is Leopold Schmidt's "Aus dem Musikleben der Gegenwart: Beiträge zur zeitgenössischen Kunstkritik. Mit einer Einleitung von Richard Strauss" (Berlin: Hofmann & Co.). The author is a well-known musical critic in Berlin, and the first volume is devoted exclusively to music in the Prussian capital. The second volume describes musical compositions and performances in other German and European cities. Even those who may not agree with some of Leopold Schmidt's views will derive pleasure and advantage from his clear and comprehensive survey of the development and distinctive qualities of contemporary musical productivity. The introduction by Strauss, the celebrated conductor, adds greatly to the value of the work, which he warmly commends, although differing from the author on several important points.

Old Lace: A Handbook for Collectors. By M. Jourdain. New York: Charles Scribner's Sons. $4.50 net.

Its technical as well as its historical interest gives this book a claim upon lovers of old lace. As Miss Jourdain points out, the lace collector has the especial advantage in the pursuit of his art that he need not be ever on guard against imposture. A piece of modern enamel or silver may be treated to simulate old age in a manner that will deceive the very elect, but the methods of production of real and machine-made laces differ so essentially that imitation lace has small deceptive quality. The needle-point laces are entirely built up from a foundation of threads worked over by buttonhole stitch and other loopings, and the bobbin laces in many of their varieties introduce plaits to connect different portions of the ornament. As yet no machine has been able to duplicate these stitches successfully and cheaply. Moreover, in machine-work the operating force is uniform and the tension on the thread is constantly the same, producing a perfectly regular, flat tissue, whereas the slight irregularities caused by the unequal tension in hand-work are like a succession of minute ripples, lending to the work a peculiar individuality. It is just this treatment of the technical aspects of the subject, always a vital matter to collectors, which will give the present book a special place in the English literature of the subject. Much space is given to detailed accounts of the characteristics of the different varieties, and the thoroughness with which the work is done is exemplified on page 25, where a note describes eight kinds of brides, or connections, found in three square inches of fine rose point.

Having reëdited Mrs. Bury Palliser's classic "History of Lace" in 1902, the author's knowledge of that branch of the subject also is well grounded, and the historical material presented is judiciously chosen. An occasional echo of Mrs. Palliser may be heard in the de-

velopment of the text, as well as in the arrangement which devotes a chapter to the product of each lace-making country or municipality. The laces of Germany, Sweden, Russia, Spain, Denmark, Switzerland, and Austria are not treated because they "did not result in work of any high artistic quality or importance." Austria and Russia can scarcely be said to have produced old lace, and Miss Jourdain thinks that the far-famed point laces which came out of Spain after the dissolution of the monasteries in 1830 were not native products, but had been brought there earlier from Flanders or Italy. Yet it is to be regretted that a little space has not been given to the other four countries, for, according to good authorities, they were all making lace in the seventeenth century, and the products of Germany and Denmark at least seem to have been well enough known outside their own boundaries to make their acquisition of some interest to collectors. The author believes that it is impossible to trace the actual origin of lace to Oriental sources, as has sometimes been attempted, but that the design of the early geometric laces, like that of metal work, was affected by the East, a fact hitherto unrecognized. Lace appears to have been born in Italy, and Venice, by her position as the great buyer and distributor of Eastern handiwork, was peculiarly fitted to transmit Oriental influences. In Venice the embroidery and rimming of white linen first came into fashion in Europe, and in Venice motives of Oriental design were first applied to the ornamentation of linen. The principles of design used were, "interlaced, repeating, star-shaped, and polygonal ornament, purely geometrical," and "these forms are exclusively used in early Italian reticella and *punto in aria* at a date when flowing scrolls and conventionalized flower ornament was freely used in the designs for embroidery." This is an interesting subject for discussion but it seems possible that technical difficulties which would never be encountered in embroidery might occur in the manufacture of flowing scrolls in lace, and so might limit the development of the design. The early lace was called *punto in aria*, or "stitch in the air," because it was made without any foundation of net or linen, and it is easy to see that at first beautiful curves would be an ideal difficult of achievement.

The illustrations are numerous and are excellent for their size (8½x6½). Particularly worthy of attention are plates xxiv, xxvi, and xxvii, which show specimens of rose point, of rose point pieced, the design being ruined in the process, and of imitation rose point, with cut linen foundation. An index of plates would be a convenience, although this lack is somewhat atoned for by a full general index. The contents of the book are not altogether new, for many of the chapters and illustrations originally appeared in the *Connoisseur*, having been revised and rearranged for their present purpose.

The frontispiece of the *Burlington Magazine* for August is a photogravure after a new Rembrandt, tentatively dated 1646 by Claude Phillips, representing either Diana or one of her nymphs reposing in a wood, her dogs by her side. The tiny naked figure has all Rembrandt's incredible ugliness, but one can fancy the flesh very gleaming in its dusky surroundings. The picture is, however, essentially a landscape. It is not so interesting in form or composition as some other of the master's works in this kind, but is said to be superb in color. A. M. Hind writes interestingly again on engravings and their states, and gives, in reproduction, a number of notable instances of the strange transformations a given plate may undergo in the course of its existence. In a sense, however, the most notable article is that on "The Training of the Memory in Art," which deals with Le Coeq de Boisbaudran's methods of teaching and their excellent results. The drawings by his pupils reproduced are certainly extraordinary—one wishes that the exact conditions under which they were made had been more clearly specified. It has long been the conviction of the present writer that the lack of proper training of the memory is the greatest defect of our modern manner of studying drawing, and one would like to know just how De Boisbaudran supplied this want. Apparently he depended on a sort of secondary memory—the memory of a drawing executed from nature or from the original to be copied—instead of on a direct memory of the object itself. He seems to have been troubled when Legros, sent to the Louvre to make a study of Holbein's Erasmus, came back with nothing in his portfolio, only to realize that the pupil was more radical than the master, and had brought his drawing in his head. It is this direct memory that we should like to see trained in our art-schools. The question is, how far it is possible to avoid the substitution of habit and formula for real observation and recollection. In the work of most artists who rely upon memory there is a vast amount of *chic*—of details supplied by tricks of manipulation or by a system of arbitrary symbols. Just where and how to draw the line between such work and the necessary and proper supplementing of special observation by the accumulated result of former observations—between *chic* and knowledge—is the great difficulty.

John Bunyan Bristol, landscape and portrait painter, has died at the age of eighty-three. He was a regular exhibitor at the National Academy of Design and the Century Club.

THE ONE SHORT CROP.

That the country's cotton crop, whose condition was well below the average a month ago, had been badly hurt by the drought of August, was conceded before the government estimate of last Thursday was given out. That estimate, nevertheless, was something of a shock. Out of five trade estimates, earlier in the week, none put the crop's condition as low as 64 per cent., and the figures ran as high as 68. The Department of Agriculture gave out 63.7. This is the lowest September estimate in the twenty-seven years of the monthly government reports. It follows an estimate of planted acreage, in June, smaller than any such estimate since 1905. The cotton

Investors—small or large—should inform themselves on Irrigation Bonds.

These bonds are secured by liens on the most fertile farm lands in America. The value of the security is in many instances four times the loan. The first year's crop often sells for more than the loan, sometimes by several times over.

Some of these bonds are municipal obligations, like School Bonds. They form a tax lien on the real property within the district.

They are serial bonds, so one may make short-time or long-time investments. Each year, as part of the bonds are paid, the security back of the rest is increased.

The bonds pay six per cent. — a higher rate than one can obtain on any other large class of bonds equally well secured.

The bonds are for $100, $500 and $1,000, so one may invest either little or much.

These are ideal bonds, and they have become the most popular bonds that we handle.

We are the largest dealers in Reclamation Bonds. In the past 15 years we have sold 70 separate issues, without a dollar of loss to any investor.

Now we have written a book based on all this experience, and the book is free. Please send this coupon to-day for it, for you owe to yourself a knowledge of the facts.

trade on Thursday figured out an "indicated yield" of 11,000,000 bales; yet the price of cotton hardly stirred. One may reasonably ask, how this should be possible.

Partly because the poor report was foreshadowed by a rise of 1½ cent per pound since early summer; partly for other causes. For one thing, September "indicated yields" are treacherous, last year, the trade's forecast at this time was remarkably correct, but it over-estimated the crop by a million bales in 1907, and under-estimated it by a million and a half in 1904. The planter is notoriously apt to exaggerate bad conditions in his statements to outside estimators; in so far as he can influence them in their compilations for the cotton market, they may usually reckon on influencing prices in the producer's favor.

It is true that any American crop of less than 12,000,000 bales would be small, and that 11,000,000 bales would be notably deficient. Such a crop would run far short of meeting the normal "world's requirements" of American cotton for the season. Last year, the Liverpool "Ellison estimate" figured out, as the sum of such requirements, 12,438,000 bales; it is at least as large this season. Still, there are ways of making up even so large a deficiency. In Egypt, for instance, where annual cotton production runs to nearly a million and a half of bales, the prospects of this season have been extremely favorable; India's crop, which is second in magnitude to our own, is figured out to be 5 per cent. larger than last year's. Furthermore, an unusually large surplus has been left over from the world's crop of 1908. Europe, whose storehouses held 291,000 bales at this time in the famous "short year," 1903, and only 723,000 even a year ago, reported 1,225,000 bales last Saturday.

These circumstances would doubtless serve to relieve the strain on the world's cotton-spinning trade; but the fact is equally obvious that, just so far as large foreign crops and large foreign storehouse reserves would mitigate the ill effects of a deficient yield in the United States, exactly to that extent would they handicap such familiar compensations to our own markets as a high price for producers and a valuable cotton export trade. However, the cotton season is still young. In 1903, the year of the 10,000,000-bale crop and the "Sully corner," foreign consumers did not show their hand until December. Cotton's highest October price at New York city was 10⅝ cents a pound; the highest November figure, 11⅝. Not until January did the market pass sixteen cents.

Fernando Cortes

And His Conquest of Mexico

1485-1547

By Francis Augustus MacNutt

Author of "Bartholomew de Las Casas," Editor of "Letters of Cortes," etc.

No. 44 in **Heroes of the Nations.**

Crown 8vo. Illustrated. Cloth, $1.35 *net; Half Leather,* $1.60 *net.*

In a narrative remarkable for its dramatic power, graphic characterization, and exacting scholarship, Mr. MacNutt, whose Las Casas and Letters of Cortes have made him a recognized authority in his field, tells the story of one of the most striking and altogether extraordinary incidents in the world's history—the conquest of Mexico. The book will commend itself by its brevity as well as by many solid and attractive qualities.

To receive the current numbers in a convenient (temporary) form. Substantially made, bound in cloth, with THE NATION stamped on the side in gold. Holds about one volume. Papers easily and neatly adjusted. Sent, postpaid, on receipt of 75 cents. Address The Nation, 20 Vesey Street, N.

The Nation.

NEW YORK, THURSDAY, SEPTEMBER 16, 1909.

The Week.

"Controversy" is altogether too dignified a term to describe the miserable war of words that now rages about the Pole. The situation is deplorable. The most dramatic achievement in the scientific annals of the age is being written down in Billingsgate. The nation's disaccustomed ears ring again with the once familiar epithet, "liar." The goal which was striven for during three hundred years of self-sacrifice and heroic devotion, once attained, seems to have let loose the baser passions of men, and the interests of truth are made secondary to the consideration of newspaper scoops, Chautauqua profits, and book royalties. For this unhappy result we cannot hold Commander Peary entirely blameless. The provocation, from his point of view, must have been great. If the painfully-won crown of his life's work were really in danger of being snatched from him by an impostor, the temper of his challenge to Dr. Cook might be excused. But faith in his own cause and in the ultimate triumph of truth should have lent him patience. If Dr. Cook's story is a fabrication, Commander Peary must know that it could not stand the light of serious investigation for three months. Its improbabilities had struck against the world's suspicion even before the message from Peary came. That message has only given the signal for a mud-slinging contest. Both explorers may be reminded of the moral verse:

> Were I so tall to reach the Pole,
> Or grasp the ocean with my span,
> I must be measured by my soul,
> The mind's the standard of the man.

Happy Panama Canal Zone! Its status changes in a way to make the leopard's spots envious. One day it is the possession of the United States, and if any one else should undertake to plant a flag there, let him beware. The next day there is doubt about the permanence of our suzerainty, and to-day, behold! it is not a possession of the United States at all; that is, so far as the tariff law is concerned. This is the startling opinion of the eminent Trust-buster, Wade H. Ellis, now acting-Attorney-General in Mr. Wickersham's absence. According to this remarkable brand of law, the canal zone, though owned, controlled, and operated by the United States, is merely a "place subject to the use, occupation, and control of the United States," and, therefore, the Payne-Aldrich tariff does not apply. Those cynical persons who believe that lawyers will give any opinion desired, will find this decision the occasion for much ribald laughter. The government wants to get its canal supplies cheap, so it avoids the tariff by denying that the zone is a possession. There is no escaping the tariff swindle for the private citizen. He cannot declare himself a resident one day and a non-resident the next, and, therefore, he is bound to look on the government as a dodger.

A highly interesting turn will be given to the investigation of the railway rebate abuse, by the government's inquiry into the charges that certain railways secretly and illegally cut the rates offered by them to certain transatlantic steamship lines on export and import freight. The evidence of such rebating, published by the *World*, appears to be conclusive; it is, in fact, admitted by the assistant general agent of one steamship company, the Holland-America Line. This agent alleges that the offence has not been committed by or in behalf of his own line during the past eighteen months or two years; but the fact of violation of the law remains. The correspondence of the steamship company in the matter, which has in some way been obtained and published, is explicit on this point. It mentions in one letter an inland freight rate agreed upon, which is "5 cents below the tariff inland rate"; in another, that "the rebate to outports will be refunded monthly on your side"; in still another, "a private rebate of 2 cents on the barrel" of imported fish, and so on in a great number of cases. In this same remarkable correspondence there is constantly displayed full knowledge of the illegality of the act and the penalties incurred. If evidence of what was going on should fall into the Interstate Commerce Commission's hands, one letter carefully points out, "we should be liable to a fine of $20,000 in each case." Clearly the result of such railway rebating must be to give some shipper or importer, at the western end of the railway line, a secret advantage over all competitors. The fact that the rebate was granted, not to an individual, but to an ocean steamship company, hardly disguises the transaction in the popular view, and does not alter it at all in the eye of law. Both the anti-Trust Law of 1890 and the Elkins Law of 1903 were particularly careful in providing against the very operations now under review. The whole matter calls for investigation in the courts, from top to bottom.

The address by the new chairman of the House Banking and Currency Committee, to the Pennsylvania bankers, was interesting because of its positive declaration for a central bank as the solution of our currency situation. People in touch with the Monetary Commission have for some time been aware that the judgment of the Commission's leading members was veering in that direction, and that the visit of a sub-committee to the European banking centres, a year ago, had emphasized that drift of opinion. No formal conclusion has been reached on the matter by the Commission as a whole, and Mr. Vreeland's opinion must for the present be regarded as purely individual. His official position necessarily gives it weight, however, and there is reason to suppose that Senator Aldrich, occupying a similar place at the head of the Senate Finance Committee, concurs in it. Mr. Vreeland does not go very far into details. His idea is for a central bank with monopoly of note circulation, with dividends limited to 4 per cent.—so as not to encourage excursions for the sake of profit into the field of competitive banking—and with what he describes as "some measure of government control."

It is no final condemnation of the new primary law in Ohio that it failed to draw out a heavy vote at the first trial. With nothing but local offices at stake, the number of voters participating was, to say the least, far larger than ever known in the old caucus method. At Columbus, the Republican machine candidate for the Mayoralty was defeat-

ed by a young man with nothing behind him except an admirable record, as City Solicitor, for hunting down grafters. In Cincinnati, an adherent of the Cox machine took the Republican nomination without opposition, but the Democrats shattered the Bernard slate from top to bottom, giving a large majority to John W. Peck, a young attorney of apparently good promise. With Gov. Harmon giving an unusually popular administration, and the Democrats of Cincinnati seemingly awake to their opportunity, the disgraceful submission to Cox may yet go far to put the Democratic party within reach of a general victory. In Cleveland, the primary showed that Tom Johnson is still the chosen leader of his party. The refusal of some citizens to take part in the primaries because of the necessity of stating their party affiliation, was only to have been expected. The Ohio law has its defects, for no State has yet brought forth a Legislature at heart devoted to the discrediting of the party boss. The predictions of repeal, however, will hardly be verified. The voters of Ohio will not permit a backward step without a fair trial of the new system.

There can be no question that the Census Bureau is in earnest about keeping partisan politics out of its work. The Director is executing the President's instructions in that matter with vigor and intelligence. He has sent a letter to each supervisor commanding him to resign from any political committee of which he may be a member. Another point carefully considered by Director Durand is the question whether any supervisor may possibly hold a State office which might debar him from accepting a Federal position. A similar difficulty, it will be remembered, arose when Mr. Heney was at once a special employee of the Attorney-General's office, and assistant prosecuting attorney in San Francisco. It is, of course, undoubted that most of the appointments as supervisors and enumerators are political. Their names are "submitted" by Congressmen and local chairmen, either as a reward for past party services, or in the hope of benefits to come. But the authorities are making it clear that one benefit which will *not* come is the taking of the census as an adjunct to party machines.

A question of no little interest in the South is discussed in a pamphlet entitled "Public Taxation and Negro Schools," by Charles L. Coon, white superintendent of schools at Wilson, North Carolina. It embodies a paper read before the Twelfth Annual Conference for Education in the South, some of the conclusions of which, when reported at that time, were received with incredulity by several of the Southern newspapers. In view of repeated threats to divide school funds according to races, and the insistence in many quarters that the negro gets more for his schools than he pays in taxes, it is highly important that the actual facts shall become known. These Mr. Coon now lays before us as a result of a careful study of the statistics of eleven States, with a population, in 1900, of 11,776,391 whites, and 7,199,374 negroes. These same States now spend $32,068,851 annually for elementary and secondary public education. Of this sum, if it were distributed among the races according to their respective numbers, the negroes would receive as their share $12,800,000, or 40 per cent. As a matter of fact, they received only $4,736,375 in all, or 14 per cent. The question follows whether this is largely a burden upon the white taxpayer.

It is impossible, Mr. Coon says, to obtain complete data bearing on this matter, but he has secured figures for Virginia, North Carolina, and Georgia which enable him to settle it for those States with some degree of accuracy. Taking Virginia first, he finds, from the State Superintendent's report, there was raised in 1907 for schools by taxation $3,305,871, of which $489,228 went to negro schools. Analysis of the taxes shows that the negroes paid $120,000 for poll taxes, $22,500 for State tax levies on property, and $68,895 in local assessments. Setting aside from the library fund, the State and local taxes on corporations and direct State appropriations, the percentage to which the colored people are numerically clearly entitled, Mr. Coon is certain that they should be credited with $507,305 of taxes, or $18,077 *more* than they actually receive from the State for their schools. In North Carolina the colored people should receive $429,197, whereas they now obtain only $402,658. In Georgia the figures are even more amazing, for there the excess in favor of the negro is no less than $141,682. That is, the white schools profit by that sum from negro taxation.

The victory of the strikers at the Pressed Steel Car Company's works at McKee's Rocks is really a triumph of common sense. The company has surrendered on nearly every point; the final wage question is left for arbitration, but an advance is already given. Thus ends in deserved disaster the stupid policy of President Hoffstot and the other officials of the company. Now, after fifty-seven days, the strikers have all gone back to work, the company is said to have lost $1,000,000 and, what is worse, has achieved the reputation of being inefficiently managed and behind the times in dealing with its labor. As for the strikers, unorganized but with righteous demands, they brought a great company to its knees and have, we confidently believe, taught a salutary lesson to corporation managers everywhere.

George Bernard Shaw continues to devote himself to his task of manufacturing paradoxes. What the world, especially the world of culture and science, holds to, is necessarily wrong. Just turn upside down what good people believe, and you have the truth, is Shaw's simple formula. Among other things of which Shakespeare was artistically guilty was using blank verse—and bad blank verse—because he was not able to write good prose. To show us how Shakespeare should have done it, and how easy it is, Shaw wrote a play in the Shakespearean style. It is so good that no one will ever mistake it for Shakespeare's; and, perversely, they will continue to prefer the Bard of Avon, for they know no better. And now Mr. Shaw comes out with a denunciation of vivisection; not in the spirit of controlling it, so as to combine humaneness and the progress of science, but as a fling in the face of the scientists whose cock-sureness is a splendid target for a Shavian paradox. To succeed along his present line, Mr. Shaw would need a long and painful campaign of propaganda, the object of which would be to explain to the people the eloquence and beauty of the paradox as such—and then he might be able to

cram his particular absurdities down their throats.

The return of the amateur golf championship to the West was generally expected, though the Eastern representatives in the tournament fell by the way somewhat earlier and easier than was looked for. If Jerome Travers had been in form and had contested, the result might have been different. It is only fair to admit, however, that the young Western players have developed a very high quality of golf. Their medal scores are astonishingly low. When Gardner, who never before competed, can play two successive days in 146 and 147 for 36 holes, the pace is confessedly terrific. In previous championship struggles, Travis has been put out now and then in matches at 18 holes; but this was usually thought a "fluke," and it was said that no amateur could defeat him at 36 holes. But this year the test matches have beeen at 36 holes, and the youthful Gardner beat the veteran Travis rather easily. These dashing youngsters of the Western links seem able to combine brilliancy with great steadiness. When they can do that, there can be no doubt that golf is preeminently a game in which youth will be served.

Americans back from Piccadilly report the Briton to be in unwontedly humble state. He feels his insular security vanishing before the aeroplane—in his case, a real "scareoplane." The result of all this is a state of things that only a Carlyle could describe, in his familiar French Revolution style, with apostrophes to budgets and balloons, conscription and suffragettes, tortured wealth and gleeful Radicals. In his article on Jean Paul in the *Edinburgh Review* of 1827, he said:

> Except by name, Jean Paul Friedrich Richter is little known out of Germany. The only thing connected with him, we think, which has reached this country is his saying, imported by Madam De Staël, and thankfully pocketed by most newspaper critics, that "Providence has given to the French the empire of the land; to the English, that of the sea; to the Germans, that of the air."

But the threatened German empire of the air is, of course, of a kind not dreamed of in Jean Paul's philosophy.

Lord Rosebery's attack upon the Liberal budget, in his recent speech at Glasgow, had been pretty thoroughly discounted, yet its political effect must be considered. The orator disclaimed any title to speak for the Liberal party; he was again in his favorite "lonely furrow"; but his antagonism will count mainly as that of a former Liberal Prime Minister. Merely as from a rich man, and a member of the House of Lords, his assault upon a "popular" scheme of taxation might tend to make it even more poular, and so aid its Ministerial supporters. The Chancellor of the Exchequer is booked to follow Lord Rosebery in Glasgow at an early day. Mr. Lloyd-George will doubtless be tempted to turn to some of Rosebery's published writings and discourses in the spirit of the latter's own statement, that the chief use of old speeches is to be "explored for untimely quotation." In that way, the Chancellor might adopt for himself the words which Rosebery applied to Sir Robert Peel, that he "preferred the fruitful task of administration to the spent candor of criticism." But on the crucial point of the right of the Lords to modify a finance bill, Lloyd-George could draw a deadly citation from a speech of Lord Rosebery's in the Gilded Chamber itself. When the budget of 1894—denounced as socialistic almost as fiercely as that of this year—came before the Lords, Rosebery deprecated even discussion of the measure. His words were:

> I do not think it is necessary for the purpose of passing the bill that they [the peers] should make themselves master of it, because I deprecate altogether the idea that the House of Lords has anything to do with money bills. Any discussion of it must obviously be academic, and therefore I should have thought the least said soonest mended with regard to this measure.

This, of course, is no denial of the right of the Lords to reject a money-bill *in toto*, if they see fit, and so bring on a conflict with the House of Commons. That is not a question of power, but of political tactics, or of courage.

Paul Leroy-Beaulieu points out in *L'Economiste Français* the danger of a tariff war between France and the United States. This arises primarily from the fact, that, in our commercial agreement with France, there was no clause calling for notice of its abrogation. Consequently, under our new tariff law, the French agreement can be and is terminated on October 31. At that date, unless some other commercial treaty is first negotiated, the exports of France will be subject in our custom houses to the maximum tariff rates. Meanwhile, England and Germany, under the terms of their agreements with this country, are entitled to six months' notice, so that for more than three months they would enjoy a tariff advantage in our markets over France. This is what makes the situation so critical for the French authorities, as also for the Government at Washington. If we clap on the maximum tariff upon French goods, France may make reprisals by applying her own maximum rates to American exports. The result could not fail to be disastrous to both sides, precisely as was the case in the tariff war between France and Switzerland. M. Leroy-Beaulieu strongly argues against any such policy.

Prime Minister Stolypin continues to demonstrate his title to real statesmanship. Not only by comparison with the average run of Russian bureaucrat, but with the best statecraft that Europe can show, he looms up large. It is no mean achievement to have steered a disorganized Empire through anarchy to peace. The revolutionary movement, by common admission, has been checked for years to come. The transformation of the Russian system of land-tenure to which he has set himself, is undoubtedly the most impressive economic scheme that any government is at present concerned with. Finally, there is the development and colonization of Siberia, a movement which is attracting much attention even outside of Russia. From 1906 to the beginning of the present year, 150,000 peasant families were colonized in western Siberia. In view of the large size of the Russian peasant family, this means the transplantation of close to a million souls from overcrowded European Russia to a region of very high fertility. Statistics indicate that within three years the Steppes region alone may be in a position to export 50,000,000 bushels of wheat annually. Railway construction is being actively carried on. The development of the country's mineral resources proceeds more slowly, but geological surveys are going on all the time, and the future has almost limitless possibilities.

THE NEW POLITICAL EUROPE.
